A CYCLOPEDIA OF EDUCATION

EDITED BY

PAUL MONROE, PH.D.

PROFESSOR OF THE HISTORY OF EDUCATION, TEACHERS COLLEGE
COLUMBIA UNIVERSITY

DEPARTMENTAL EDITORS

EDWARD F. BUCHNER, PH.D. . .	Professor of Education and Philosophy, Johns Hopkins University, Baltimore, Md.	BIOGRAPHY, PHILOSOPHY
WILLIAM H. BURNHAM, PH.D. .	Professor of Pedagogy and School Hygiene, Clark University, Worcester, Mass.	HYGIENE
GABRIEL COMPAYRÉ	Inspector General of Public Instruction, Paris, Member of the Institute of France.	EDUCATION IN FRANCE
ELLWOOD P. CUBBERLEY, PH.D. .	Head of Department of Education, Leland Stanford Junior University, Stanford University, Cal.	EDUCATIONAL ADMINISTRATION
JOHN DEWEY, PH.D., LL.D. . .	Professor of Philosophy, Columbia University, New York City.	PHILOSOPHY OF EDUCATION
CHARLES H. JUDD, PH.D., LL.D. .	Director, School of Education, University of Chicago, Chicago, Ill.	PSYCHOLOGY
ARTHUR F. LEACH.	Charity Commissioner for England and Wales, St. James, London.	MIDDLE AGES, REFORMATION
WILL S. MONROE, A.B.	Professor of Psychology and History of Education, State Normal School, Montclair, N.J.	BIOGRAPHY, AMERICAN
J. E. G. DE MONTMORENCY, M.A., LL.B.	Barrister-at-Law, London; Assistant Editor, <i>The Contemporary Review</i> .	HISTORY OF EDUCATIONAL ADMINISTRATION
WILHELM MÜNCH, PH.D. . . .	Late Professor of Pedagogy, University of Berlin, Berlin, Germany.	EDUCATION IN GERMANY
ANNA TOLMAN SMITH	Specialist, Bureau of Education, Washington, D.C.	NATIONAL SYSTEMS
HENRY SUZZALLO, PH.D. . . .	Professor of the Philosophy of Education, Teachers College, Columbia University, New York City.	METHOD OF EDUCATION
FOSTER WATSON, LITT.D. . . .	Professor of Education, University College of Wales, Aberystwyth, Wales.	ENGLISH EDUCATIONAL HISTORY

CONTRIBUTORS TO VOLUME IV

- Francis A. Alabaster, A.M.**, Dean, Nebraska Wesleyan University. (*Nebraska Wesleyan University.*)
- Carter Alexander, Ph.D.**, Assistant Professor of Educational Administration, University of Missouri. (*University of Missouri.*)
- Benjamin R. Andrews, Ph. D.**, Secretary Department of Household Arts, Teachers College. (*Educational Museums.*)
- Roswell P. Angier, Ph.D.**, Assistant Professor of Psychology and Acting Director of the Psychological Laboratory, Yale University. (*Topics in Psychology.*)
- Joseph Cullen Ayer, Jr., Rev., Ph.D.**, Professor of Ecclesiastical History, Divinity School, Protestant Episcopal Church, Philadelphia, Pa. (*Topics in Early Christian and Medieval Education.*)
- Leonard P. Ayres, Ph.D.**, Director, Department of Education, Russell Sage Foundation. (*Medical Inspection; Open-air Schools.*)
- Kendric C. Babcock, Ph.D.**, Specialist in Higher Education, Bureau of Education, Department of the Interior, Washington, D.C. (*National University.*)
- Elijah W. Bagster-Collins, A.M.**, Associate Professor of German, Teachers College, Columbia University. (*Modern Languages.*)
- Franklin T. Baker, Litt.D.**, Professor of English Language and Literature, Teachers College, Columbia University. (*Children's Literature.*)
- Harry E. Bard, Ph.D.**, Formerly Commissioner of Education, Peru. (*Education in Peru.*)
- David P. Barrows, Ph.D.**, Professor of Political Science, University of California. (*Education in the Philippines.*)
- James L. Barton, D.D.**, Secretary American Board of Commissioners for Foreign Missions, Boston. (*Educational Aspect of Modern Missions.*)
- Maurice A. Bigelow, Ph.D.**, Professor of Biology, Teachers College, Columbia University. (*Topics in Biology.*)
- R. Blair, M.A., B.Sc.**, Education Officer to the London County Council. (*Education in London.*)
- Charles K. Bolton, A.B.**, Librarian, Library of Boston Athenæum, and Associate Professor of Library Science in Simmons College. (*Libraries.*)
- Edward F. Buchner, Ph.D.**, Professor of Education and Philosophy, Johns Hopkins University. (*Educational Philosophers.*)
- Anna Buckbee**, Instructor of Pedagogy, State Normal School, California, Pa. (*Oswego Movement.*)
- John C. Burg**, Secretary to President, Northwestern University, Evanston, Ill. (*Northwestern University.*)
- John Burnet, LL.D.**, Professor of Greek, The University, St. Andrews, Scotland. (*Plato.*)
- William H. Burnham, Ph.D.**, Professor of Pedagogy and School Hygiene, Clark University. (*Topics in School Hygiene.*)
- Calvin B. Cady**, Lecturer in Music, Teachers College, Columbia University. (*Music and Musical Terms.*)
- Edward H. Cameron, Ph.D.**, Assistant Professor of Psychology, Yale University. (*Topics in Psychology.*)
- E. Kate Carman**, Public Schools, Indianapolis, Ind. (*Lunches and Lunchrooms in Schools.*)
- Walter G. Clippinger, A.B.**, President of Otterbein University, Westerville, O. (*Otterbein University.*)
- Morris R. Cohen, Ph.D.**, Assistant Professor of Philosophy, College of the City of New York. (*Philosophy.*)
- Percival R. Cole, Ph.D.**, Vice Principal of the Training College, Sydney, Australia. (*Education in New Zealand.*)
- Cora Helen Coolidge**, Dean, Pennsylvania College for Women, Pittsburgh. (*Pennsylvania College for Women.*)
- Ida M. Coppinger**, American Colonization Society, Washington, D.C. (*Education in Liberia.*)
- C. Ward Crampton, M.D.**, Director of Physical Training, Board of Education, New York City. (*Physiological Age.*)
- G. C. Creelman, B.S.A., LL.D.**, President, Ontario Agricultural College, Guelph, Can. (*Ontario Agricultural College.*)
- Ellwood P. Cubberley, Ph.D.**, Professor of Education, Leland Stanford Jr. University. (*Educational Administration; State Systems of Education.*)

CONTRIBUTORS TO VOLUME IV

- George S. Davis**, LL.D., President Normal College, New York City. (*Normal College, New York City.*)
- Isaac N. Demmon**, LL.D., Professor of English, University of Michigan. (*University of Michigan.*)
- John Dewey**, Ph.D., LL.D., Professor of Philosophy, Columbia University. (*Topics in Philosophy of Education.*)
- Grace N. Dolson**, Ph.D., Instructor in Philosophy, Smith College. (*Nietzsche.*)
- Fletcher B. Dresslar**, Ph.D., Specialist in School Hygiene, U. S. Bureau of Education, Washington, D.C. (*Lighting of School Houses.*)
- Samuel T. Dutton**, A.M., LL.D., Professor of School Administration and Superintendent of Teachers College Schools, Columbia University. (*International Peace and Education.*)
- Edward C. Elliott**, Ph.D., Professor of Education; Director, Course for the Training of Teachers, University of Wisconsin. (*Teachers' Pensions.*)
- Alston Ellis**, Ph.D., LL.D., President Ohio University, Athens, O. (*Ohio University.*)
- Charles H. Farnsworth**, Associate Professor of Music, Teachers College, Columbia University. (*Music in Education.*)
- Frederic E. Farrington**, Ph.D., Associate Professor of Educational Administration, Teachers College, Columbia University. (*French Educators.*)
- John H. Finley**, LL.D., President, College of the City of New York. (*Municipal Colleges and Universities; College of the City of New York.*)
- Abraham Flexner**, A.M., Specialist, General Education Board. (*Medical Education.*)
- Homer Folks**, Secretary, State Charities Aid Association, New York City. (*Educational Aspects of Modern Philanthropy.*)
- Julius I. Foust**, Ph.B., President, North Carolina Normal Industrial College. (*North Carolina Normal Industrial College.*)
- Shepherd I. Franz**, Ph.D., Scientific Director and Psychologist, Government Hospital for the Insane; Professor of Physiology, George Washington University. (*Topics in Psychology.*)
- Harry M. Gage**, Dean, Parsons College, Fairfield, Iowa. (*Parsons College.*)
- Raymond G. Gettell**, M.A., Northam Professor of History and Political Science, Trinity College, Hartford, Conn. (*Political Science.*)
- Willystine Goodsell**, Ph.D., Assistant Professor of the History of Education, Teachers College, Columbia University. (*Petrarch.*)
- Edward McQ. Gray**, Ph.D., President of University of New Mexico. (*University of New Mexico.*)
- Louis H. Gray**, A.M., Ph.D., Assistant Editor on Hastings' *Encyclopedia of Religion and Ethics*. (*Oriental Studies.*)
- J. William Harris**, Ph.D., Professor of Education, University of the Pacific, San Jose, Cal. (*University of the Pacific.*)
- Philip J. Hartog**, M.A., B.Sc., Academic Registrar, University of London. (*University of London.*)
- William Heaford**, Journalist, London. (*Modern School.*)
- Charles R. Henderson**, Ph.D., D.D., Professor of Sociology and Head of the Department of Practical Sociology; University Chaplain, University of Chicago. (*Educational Aspects of Penology.*)
- Ernest N. Henderson**, Ph.D., Professor of Philosophy and Education, Adelphi College. (*Moral Education; Pedagogy.*)
- Milo B. Hillegas**, Ph.D., Assistant Professor of Elementary Education, Teachers College, Columbia University. (*Montessori Method.*)
- Henry Holman**, M.A., Formerly Professor of Education in the University College of Wales, Aberystwyth. (*Pestalozzi.*)
- Williston S. Hough**, Ph.M., Late Dean and Professor of Philosophy, George Washington University, Washington, D.C. (*Logic.*)
- Ira W. Howerth**, Ph.D., Professor of Education and University Extension, University of California. (*Patriotism.*)
- A. V. Williams Jackson**, Ph.D., LL.D., Professor of Indo-Iranian Languages, Columbia University. (*Oriental Studies; Persian Education.*)
- Joseph Jastrow**, Ph.D., Professor of Psychology, University of Wisconsin. (*Mesmerism; Mind-reading.*)
- John B. Johnson**, Ph.D., Professor of Comparative Neurology, University of Minnesota. (*University of Minnesota.*)
- Wm. Dawson Johnston**, Litt.D., Librarian of Columbia University. (*Libraries: Pedagogical Libraries.*)
- E. Joranson**, Principal of Northwestern College, Fergus Falls, Minn. (*Northwestern College.*)

CONTRIBUTORS TO VOLUME IV

- Charles H. Judd**, Ph.D., LL.D.; Professor and Head of the Department of Education, Director of the School of Education, University of Chicago. (*Topics in Educational Psychology.*)
- Isaac L. Kandel**, Ph.D., Teaching Fellow, Teachers College, Columbia University. (*Topics in Educational History and Administration.*)
- Henry C. King**, D.D., President of Oberlin College. (*Oberlin College.*)
- George C. Keidel**, Ph.D., Associate in Romance Languages, Johns Hopkins University. (*Myths and Mythology.*)
- George P. Krapp**, Ph.D., Professor of English, Columbia University. (*Philology; Teaching of English Literature.*)
- Edward Kremers**, Ph.G., Ph.D., Director of the Course in Pharmacy; Professor of Pharmaceutical Chemistry, University of Wisconsin. (*Education in Pharmacy.*)
- E. G. Lancaster**, Ph.D., President of Olivet College. (*Olivet College.*)
- Arthur F. Leach**, Charity Commissioner for England and Wales, London. (*Topics in English Educational History*)
- Gonzalez Lodge**, Ph.D., LL.D., Professor of Latin and Greek, Teachers College, Columbia University. (*Ovid.*)
- Samuel B. McCormick**, D.D., LL.D., Chancellor, University of Pittsburgh. (*University of Pittsburgh.*)
- Charles T. McFarlane**, Pd.D., Controllor of Teachers College, Columbia University. (*Maps, Charts, etc.*)
- Richard C. MacLaurin**, LL.D., President of Massachusetts Institute of Technology. (*Massachusetts Institute of Technology.*)
- Frank L. McVey**, Ph.D., LL.D., President of the University of North Dakota. (*University of North Dakota.*)
- C. Riborg Mann**, Ph.D., Associate Professor of Physics, University of Chicago. (*Physics.*)
- Shailer Mathews**, D.D., Professor of Historical and Comparative Theology; Dean of the Divinity School, University of Chicago. (*Pedagogy of the New Testament.*)
- Charles M. Melden**, D.D., President of the University of New Orleans. (*University of New Orleans.*)
- George L. Meylan**, M.D., Associate Professor of Physical Education and Medical Director of the Gymnasium, Columbia University. (*Henrik Ling; Olympic Games; Physical Education.*)
- Paul Monroe**, Ph.D., Professor of the History of Education, Teachers College, Columbia University. (*Topics in the History of Education.*)
- Will S. Monroe**, Ph.D., Professor of Psychology and Education, State Normal School, Montclair, N.J. (*American Biography, etc.*)
- Frederick Montesser**, Ph.D., Head of German Department, DeWitt Clinton High School, New York City; formerly Lecturer on Education, New York University. (*German Educational Biography.*)
- J. E. G. de Montmorency**, B.A., LL.B., Library Editor of *The Contemporary Review*; Barrister, London, England. (*Topics in English Educational History*)
- Vida F. Moore**, Ph.D., Professor of Philosophy and Pedagogy, Elmira College. (*Lotze.*)
- William F. Notz**, Rev., Ph.D., Professor of English and Hebrew, Northwestern College, Watertown, Wis. (*Lutheran Church and Education in the United States.*)
- Mary A. Nutting**, Professor of Nursing and Health, Teachers College, Columbia University. (*Education for Nursing.*)
- George Ordahl**, Ph.D., Professor of Psychology and Education, University of Nevada (*University of Nevada*)
- M. Vincent O'Shea**, B.L., Professor of Education, University of Wisconsin. (*Education for Parenthood.*)
- Edwin B. Owen**, B.S., Registrar, North Carolina Agricultural and Mechanical College. (*North Carolina Agricultural and Mechanical College.*)
- John L. A. Paton**, M.A., High Master, Manchester Grammar School, Manchester, England. (*John B. Paton.*)
- Arthur G. Paul**, A.B., Registrar; Instructor in English, Occidental College, Los Angeles, Cal. (*Occidental College.*)
- Josiah H. Penniman**, Ph.D., LL.D., Vice-Provost, University of Pennsylvania. (*University of Pennsylvania.*)
- Clarence Arthur Perry**, Division of Recreation, Russell Sage Foundation, New York City. (*Playgrounds.*)
- Clark E. Persinger**, A.M., Associate Professor of American History, University of Nebraska. (*University of Nebraska.*)
- Jean Phillipe**, Ph.D., Associate Director of the Laboratory of Physiological Psychology, Sorbonne, Paris. (*Henri Marion.*)

CONTRIBUTORS TO VOLUME IV

- Walter B. Pillsbury**, Ph.D., Professor of Psychology, University of Michigan. (*Topics in Psychology.*)
- C. H. Pluggé**, Bureau of Education, Washington, D.C. (*Education in the Netherlands.*)
- Mary W. Plummer**, Principal, Library School. The New York Public Library. (*Training for Library Service.*)
- Robert W. Prescott**, Secretary to President, University of Oregon. (*University of Oregon.*)
- William M. Proctor**, A.M., Professor of Education and Biblical Literature, Pacific University, Forest Grove, Ore. (*Pacific University.*)
- George H. Putnam**, LL.D., Publisher and Author, New York City. (*Literary Censorship.*)
- Hastings Rashdall**, Rev., D.Litt., D.C.S., Canon of Herford. (*Oxford University.*)
- Josephine A. Rathbone**, Vice-Director, School of Library Science, Pratt Institute, Brooklyn, N.Y. (*Libraries: School Libraries.*)
- Wylls Rede**, A.M., D.D., Acting Professor of Philosophy and Ethics, Goucher College, Baltimore, Md. (*Philosophers and Church Fathers.*)
- Rudolph R. Reeder**, Ph.D., Superintendent, Orphanage, Hastings-on-Hudson. (*Orphanage Homes and Schools.*)
- Charles R. Richards**, S.B., Director, Cooper Union for the Advancement of Science and Art, New York City. (*Manual Training.*)
- L. S. Rowe**, Ph.D., LL.D., Professor of Political Science, University of Pennsylvania. (*Education in Mexico.*)

A CYCLOPEDIA OF EDUCATION (4)

LIBERAL ARTS. — A term used in contradistinction to the fine arts on the one hand and the technical and practical arts on the other (for the former, see **ART IN THE SCHOOLS**, etc., for the latter see **INDUSTRIAL EDUCATION** and **TECHNICAL EDUCATION**). The liberal arts have constituted from the time of the Greeks the curriculum of secondary and higher schools. The function of the liberal arts in education is discussed in the aspects in **ART IN EDUCATION**; **COURSE OF STUDY**, **THEORY OF**; and **LIBERAL EDUCATION**. The other aspects of greatest educational interest of the liberal arts concerns their organization into a curriculum and the development of scholastic degrees in connection with them.

During the Middle Ages the liberal arts were organized into a distinctive curriculum, including seven of the arts only. The "Seven Liberal Arts" included substantially all learning. These subjects comprise grammar, rhetoric, and dialectic, also called the trivium, and arithmetic, geometry, astronomy, and music, also called the quadrivium. The distinction between the lower and higher groups of subjects goes back to Plato, who found in music and gymnastics, the traditional Greek curriculum, sufficient material for the earliest stages of education, but organized an advanced stage in which the appropriate subjects were arithmetic, geometry, music, and astronomy. Dialectic or philosophy was recognized as a yet higher stage, appropriate only for the intellectual class. Aristotle's treatment of the curriculum is incomplete, and does not include discussion of the advanced stages. He adds reading, writing, and drawing to the traditional music and gymnastics of the old Greek curriculum. It is evident that he would add some study of the natural sciences to the advanced subjects. These were called the liberal subjects. The sophists and rhetors laid especial emphasis on the three introductory subjects, grammar, rhetoric, and dialectic, using dialectic to indicate logic, now scientifically formulated by Aristotle and no longer the general philosophical study of Plato. The Romans borrowed the Greek organization of learning, making it more systematic. M. T. Varro, a contemporary of Cicero and Cæsar, wrote a treatise, now lost, on *The Nine Liberal Disciplines*. To the seven of later authority were added medicine and architecture. Quintilian and Seneca wrote on these subjects,

but assigned no definite number of studies to an approved curriculum. During the fourth century Martianus Capella (*q.v.*) wrote the *Marriage of Philology and Mercury*, in which for the first time the arts appear authoritatively as seven. The arts represent the bridesmaids in a heavenly wedding, and on the ground of their mundane characters medicine and architecture are omitted. At about the same period Augustine wrote a treatise on six of the liberal arts, omitting astronomy and possibly other subjects because of other work and interests.

Probably Cassiodorus (*q.v.*) (480-575) was the first to assign the limit of seven as authoritative. This he did in his treatise *De Artibus et Disciplinis Liberalium Litterarum*, which formed a companion piece to a work on sacred literature, both written for his monastic brethren. Here the seven pillars of the temple of Wisdom referred to in Proverbs (ix, 1) is given as conclusive evidence of the fixity of the curriculum. Thus, as the Roman had absorbed the Greek, so the Christian accepts the Roman organization of learning. Isidore of Seville (*q.v.*), who comes shortly after, limits the subjects to seven and uses the terms *trivium* and *quadrivium*. Succeeding medieval writers indicate that the terms are fixed. Many of the great monastic leaders, later the schoolmen, and in fact all who wrote on education, give treatises on all or some of the seven liberal arts. Especially is this true of the earlier periods, with such as Alcuin (*q.v.*), Rabanus Maurus (*q.v.*), with whom, as with the later schoolmen, interest was more intense in philosophical and dialectic discussions. Painting, sculpture, and engraving add their testimony to the universality of this organization of learning even after the Renaissance brought that wider interest in knowledge which finally resulted in the overthrow of the fixed restricted conception of the limits and divisions of learning. Yet it must not be understood that the content of these various subjects was the same as in modern times. For the most part the extent of these subjects was far broader, even if the content of some of them was not so profound.

Grammar. — This subject included the study of literature as well as that of the grammatical structure of languages. Quintilian says of the subject (I, 4): "This profession, distinguished, as it is, into two parts, the art of speaking cor-

rectly, and the illustration of the poets, carries more beneath the surface than it shows on its front." The same conception prevailed with the later Greeks. Dionysius Thrax (c. 166 B.C.) divided grammar into six parts: "(1) trained reading, with due regard to prosody; (2) exposition, according to poetic figures; (3) ready statement of dialectic peculiarities and illusions; (4) discovery of etymologies; (5) accurate account of analogies; (6) criticism of poetical productions, which is the noblest part of the grammatical art." The medieval definitions are quite as broad. Isidore defines grammar as "the science of correct speaking and of the sources and foundations of literature"; Rabanus Maurus, as "the science of interpreting the poets and histories and the method of correct writing and speaking."

Grammar was thus equivalent to our term "language and literature," and as such monopolized the attention of students during the early half of the Middle Ages and formed a broad foundation for the elaborated curriculum of the later Middle Ages.

The purpose of grammatical instruction was first, then, to give the student a working knowledge of the Latin language. To do this to those who had no vernacular training, since Latin had now become a "dead" language, or at least a foreign tongue, with few books for the students, was a new task. As aids to this new educational problem a great variety of texts were produced. Donatus (*q.v.*) still furnished the foundation. But a number of compilations of proverbs, fables, dialogues, or colloquies were produced to give a reader command through inductive methods. The so-called Cato's *Distichs* (*q.v.*), a series of 143 couplets or moral maxims, formed the most popular. Memorizing of these gave a vocabulary and a working knowledge. Other grammars supplemented those of Donatus and the more elaborate one of Priscian. (See LATIN LANGUAGE.) Some of these were component parts of encyclopedic works on the Seven Liberal Arts, such as those of Capella, Cassiodorus, Augustine, Isidore of Seville, Alcuin, and Rabanus Maurus. Each century, however, produced a number of independent treatises on Latin grammar, most of them introductory texts, more appropriate to the task of introducing the pupil into a foreign tongue in an age when general culture was at a minimum and books and other ordinary means of instruction were scarce. The most noted of all these texts was the *Doctrinale* of Alexander de Villedieu (*q.v.*), written in 1199. Its most striking characteristic was that it was written entirely in verse. When the method of introductory grammatical study was wholly by memorizing, such a text had great advantages. It became very popular, almost replacing the other text and rivaling Donatus. The *Doctrinale* embodied many of the changes which the language had undergone in the period intervening since

Priscian's work, incorporated a vocabulary more necessary to the Church, and adopted methods more in harmony with the dominant dialectic interests. Other popular texts, such as Bethune's *Græcismus*, were also in verse. In addition to the grammars, numerous vocabularies appeared in the various vernaculars to assist the grammar student.

The extent to which the study of grammar introduced to a knowledge of literature is much disputed. Priscian quotes the *Æneid* of Vergil more than 700 times in his grammar. Aristophanes, Aristotle, Julius Cæsar, Cicero, Demosthenes, Herodotus, Homer, Horace, Juvenal, Lucretius, Ovid, Sallust, Terence, and other writers are also quoted, some of them more than a hundred times. Naturally none of the later texts contained anything like this amount of literary material. But a thorough study of Priscian would give a fair introduction to some of the Latin authors. To what extent the authors themselves were read is even a more disputed question. Whatever the facts may be, it is evident from recent investigation, that the old opinion concerning the ignorance of the Middle Ages must be revised to a very considerable degree. Theodulphus, Bishop of Orleans and successor of Alcuin, states that he actually taught from Vergil, Ovid, Pompeius, Sedulius, Rutilius, Arator, Fortunatus, Juvenius, Prudentius. A century later Walter von Spier comprised in his grammatical studies Vergil, the Latin Homer, Horace, Persius, Juvenal, Statius, Terence, Lactantius, Boethius, and Constantine. Such lists could be extended indefinitely. Students from various centuries have left testimony as to literary activities quite as extensive. It is but natural that the Christian authors should predominate. But a knowledge of classic literature was not extinct.

Rhetoric. — This formed the most important subject of study in Roman education, but during the Middle Ages it was the least important of the subjects of the trivium. Rhetorical training was essential in a society where political interests were dominant, but it had little significance in the training of the clergy or the men of public affairs during the Middle Ages; for church services called for little or no oratorical power, and public affairs developed no learned or trained class aside from the clergy. Rabanus Maurus states in his treatise on rhetoric, "It is sufficient if youths give some attention to the study of rhetoric. Even then not all who expect to enter the priesthood, but only those who are not as yet obliged to devote their time to pursuits of greater usefulness, should study the subject. At any rate one who wishes to acquire the art of eloquence can do so more advantageously by reading and hearing great orators than by studying the rules of rhetoric." But there was a general need in an uncultured society for a professional class that could write and compose the various docu-

ments necessary in the complicated ecclesiastical, legal, and political life of the times.

The study of rhetoric then became directed to two objects: training in composing letters to various people in authority and in constructing various documents such as contracts, wills, decrees, deeds, commendations, immunities, or records of any kind. The first was known as *Epistolæ*, the second as *Dictamen* (*q.v.*). While the various encyclopedic texts, based largely on the old Roman writers, such as those of Cassiodorus, Capella, Isidore, and Rabanus Maurus, continued to be used to some extent, far more popular were the various textbooks prepared on *Epistolæ* and *Dictamen*. The former texts dealt in a formal way with the superscription, salutation, exordium, narration, petition, conclusion, and subscription; the latter contain models for the various kinds of documents needed in temporal and ecclesiastical affairs and in common life, such as privileges, commissions, citations, donations, petitions, exemptions, visitations, etc. Many manuscripts left are the dictation of teachers or the exercise work of scholars, and it is now thought that frequent instances of this character were but recently held to be pious forgeries of designing ecclesiastics. With the founding of the universities the study of rhetoric merged into the study of Roman law, into which the Dictamen developed. In some universities, courses in the *Ars epistolandi* were also given.

Logic.—This subject was identical with dialectic, but though closely bound up with philosophy and metaphysics, did not include them as a school subject. Especially during the early Middle Ages were metaphysical and philosophical interests quite foreign. With the development of theological interests in the eleventh century, metaphysical distinctions and philosophical doctrines became of great importance; but it was only with the development of the universities and the recovery of the work of Aristotle that philosophy was added as a distinct part of the curriculum. The writings of Boethius (*q.v.*) were the sources from which the early Middle Ages drew its knowledge of logic. While with Boethius the metaphysical and philosophical implication and the relation of logic receive the greatest attention, it was his formal logic that was drawn upon for textbook purposes. Similarly Cassiodorus, Capella, Isidore, and Alcuin furnished in their encyclopedic treatises text for common use. But these again dealt almost exclusively with formal logic. With the rise of theological discussion following Rabanus Maurus and Scotus Erigena, logic became of transcendental importance, was generally mentioned second in the trivial studies, and in reality replaced grammar and its inclusive though superficial study of literature.

While from now to the close of the Middle Ages logic was the subject of greatest importance because it became bound up with all

other aspects of study and all phases of intellectual interest, yet as one of the Seven Liberal Arts studied in the schools and the universities it was formal logic alone. Logical metaphysics was reserved as a part and function of theology. Both during and preceding the university period numerous brief school texts on formal logic appeared. By far the most famous of these was the one by Petrus Hispanus (*d. 1277*), which was very generally used for 300 years.

Arithmetic.—The church was interested in the study of arithmetic, astronomy, and music, the major portion of the quadrivium, as well as in the study of the trivium. The standard encyclopedic texts of Boethius, Cassiodorus, Isidore, Alcuin, Rabanus were the basis for the study of arithmetic. While following this period numerous treatises and textbooks on arithmetic were produced, there was really no creative work and no advance made in the subject until the thirteenth century. At this time the algoristic or Arabic notation came into general use. The chief practical arithmetical interest was in the calculation of Easter. The works of Bede and of Rabanus Maurus were the chief treatises. The ordinary monk or priest, by the use of Bede's rules, could compute Easter with a knowledge of the four fundamental processes. Numerous church synods required this much arithmetical knowledge of all priests, and after the time of Charlemagne this knowledge was fairly general. To such an extent did the computation of Easter, and one other practical problem—the use of the abacus (*q.v.*)—make up the whole of arithmetic, that the ordinary term for the subject was *computus*. But the older texts, based upon Boethius, hardly touched the practical aspect of the subject. They scarcely have a reference to a rule of operation. They are devoted for the most part to a classification of numbers, a study of their properties, mystical, symbolical, and otherwise. Bede and Rabanus depart from this, later minor textbook rules follow them, and in the last centuries of the Middle Ages a great variety of texts appeared. The advance in arithmetic dates from Gerbert (*q.v.*), later Pope Sylvester, to whom is attributed by some the introduction of the Arabic notation. Without question he introduced the columal computation and the methods of fundamental operation substantially as they are to-day. The introduction of the Arabic notation was very gradual, and its general acceptance was the work of the thirteenth and following centuries. Boethius persisted as a text into the sixteenth century. From the opening of the thirteenth century, arithmetic found new utilization in commerce and industry, and there were two distinct types of arithmetical texts corresponding to the two types of mathematical interests,—the theoretical and the practical. In fact, these aspects appeared as two distinct subjects, *arithmetica* and *algo-*

risimus. The former was encouraged in the universities, though some, such as Paris, gave little or no attention to arithmetic. In some institutions, as Vienna and Leipzig, both subjects received attention. (See ARITHMETIC; ALGEBRA; COMPUTUS; NOTATION.)

Geometry. — The course followed by geometry was much the same as in the case of arithmetic. In the early third of the Middle Ages it was studied exclusively from the encyclopedic texts, though the treatise of Boethius seems to have been unknown. The scope of the subject, however, was that indicated by the etymological significance of the term. It corresponded to modern ideas of geography plus the rudiments of surveying. It was based on Pliny rather than upon Euclid. Capella adds some treatment of lines, circles, triangles, chiefly of their symbolic meaning. Rabanus writes *On the Universe* as a treatise in geometry. With Gerbert in the tenth century, a knowledge of Boethius's summary of Euclid was again brought to light. In extent it was limited to the first four books of Euclid, with full demonstrations of only three or four propositions. From the thirteenth century on, beginning with translations from Arabian sources, the subject rapidly expanded.

Astronomy — In the quadrivium this was the most popular as well as the most practical subject. Its practical use in the calculation of the calendar and in the construction of the sundial gave it a greater everyday value than arithmetic, with which it was closely bound up. Its general aspect was astrology, which was of far more practical concern to the common man than modern mathematical astronomy. In fact, astrology was related most intimately to every aspect of everyday life, and as such was a study of utmost practical concern. Whether astronomy or astrology, it was the same symbolical and mystical interpretation of phenomena that so characterized all of the theoretical study of that period. In addition to the symbolical material, the ordinary texts included the elements of mathematical geography to about the same extent that a modern school geography does, making allowance for the difference in actual scientific knowledge. Such texts were those of the encyclopedists Capella, Cassiodorus, Isidore, Alcuin, and Rabanus. Bede's work was more comprehensive. In the early university period translations of Ptolemy and of Aristotle *On the Heavens* were introduced and widely used. Elementary texts, especially that of the English monk, Sacrobosco (thirteenth century), appeared and were widely used. The general interests in and the character of teaching of astronomy in the later Middle Ages were such as to afford an excellent foundation for the rapid advance made in the Renaissance period. (See ASTROLOGY; ASTRONOMY.)

Music. — As one of the Seven Liberal Arts, music had little in common with our

modern idea of music. It consisted of the mathematical study of music, together with mystical and symbolic study of numbers after the Pythagorean ideas. It concerned itself neither with singing nor with ability to perform on an instrument. There was some practical study of music, made necessary by the church services; but this was not a liberal art, and the development of secular and folk music did not begin until late in the medieval period. As long as the Greek ideas of music prevailed, — and this was for the greater part of the Middle Ages, — there was no escape from these conditions. Boethius was the standard text, as he continued to be in the universities down into late modern times. Cassiodorus, Isidore, and other encyclopedic texts were used, but they were for the most part condensations of Boethius. Music in this sense was a part of the regular university course, and also appeared very generally in monastic and cathedral schools throughout the Middle Ages.

The later historical aspect of the arts curriculum is considered in the articles on each of the subjects mentioned; UNIVERSITIES; COLLEGE; COLLEGE, AMERICAN; incidentally in the articles on DEGREES and related topics. See also the cross references given under MIDDLE AGES, EDUCATION IN.

LIBERAL EDUCATION. — The conception of liberal education dates from Aristotle. He distinguished sharply between a liberal education, an end in itself, and a mechanical or professional training, a means for practical ends beyond itself. The chief traits of a liberal education were its association with leisure and its exclusive connection with the faculty of knowing. These two traits were necessarily combined with each other. Slaves, serfs, mechanics, tradesmen, were too much occupied with practical matters to have the leisure requisite for devotion to knowing for its own sake. Only a leisure class was in a situation to devote itself to the cultivation of the mind for the sake of the mind. Even in theoretical matters, however, excessive assiduity evinced an illiberal spirit. The chief material of a liberal education was music (in the Greek sense). The question how far practice was necessary was decided by applying the criterion suggested

above. If skill in doing became the chief end, the study was illiberal. Practice for the sake of doing should be relegated to the servile, unfree class of artisans. In a liberal education that amount of practice should be permitted which would promote the understanding and enjoyment of the arts as practiced by others.

The distinction between liberal and servile education was thus based by Aristotle upon the distinction of classes upon which Greek society was founded. Practice and education for practice were essentially illiberal because pursued by persons who were not free themselves or, who if legally free, were so given up to the narrow ends of money making, etc., as to have no interest in the exercise of the knowing faculties for their own sake. This exercise was the appropriate and congenial function for those whose social station relieved them from all menial preoccupations.

The distinction between the free character of knowing and the sub-servient character of doing which underlay the Aristotelian definition of a liberal education was also associated with several points in his metaphysical and ethical system. Pure knowing, concerned only with the rational relations of immaterial forms, was, according to Aristotle, the highest thing in the universe. It was the final cause of the existence of nature, the supreme end and good. It defined the nature of God as pure activity. It dealt with the reason, the explanation of all else, and was complete in itself — just as a syllogism is self-inclosed, needing no help from outside. In contrast, doing or practice sprang from appetites, which are bodily, not ideal: expressed needs, lack, incompleteness, imperfection, and in general was due to man's share in the animal, not the divine nature. The highest, the freest, or most liberal of all pursuits was a theoretical contemplation and inquiry which were supra-civic.

Aristotle's distinction became basic in all later definitions and classifications of education. It took specific effect in the conception of the seven liberal arts (*q v.*). His assertion of the supremacy and divinity of the purely theoretical life was employed in the middle ages to justify theology as the supreme study, and to place the monastic life above not only secular careers but above that of the parish clergy — the latter being devoted to necessary practices and not to the exclusive cultivation of divine knowledge.

At the time of the revival of learning, however, the domination of theology and allied concerns was taken as a symptom of a professional education, that preparing for the clergy. Liberal education was identified with the humanistic studies, a knowledge of classic antiquity and the Greek and Latin literatures. Although the older classification of the seven liberal arts survived, these arts — such as grammar, rhetoric, logic — were identified, not with "sacred" grammar and rhetoric

and with the logic which was a handmaiden of theology, but with that of classic literatures. However, the interest in the content of these literatures tended, while reviving the idea of liberal education, to relegate its conventional divisions to the background.

In the eighteenth century the rise of natural science began to disturb the now orthodox identification of the liberal with the ancient languages. Pure mathematics was unambiguously taken in the fold; the other sciences were left as doubtful claimants. In the nineteenth century the further development of literature and philosophy in the vernacular tongues of Europe gave the living languages a claim for recognition as elements in liberal education. The growth of history and the social disciplines perturbed the content of the idea still further. Liberal education had claimed to be the peculiar representative of man as man, of human interests as such; and history, anthropology, political economy, and sociology seemed to concern themselves with humanity even more directly than did the classic literatures.

As a consequence of such causes, practically all attempt to define a liberal education by some principle of content has been given up, though it is still generally felt that Greek, Latin, and mathematics, at least from algebra through calculus, are peculiarly liberal in character. The attempt is now made to define it from the standpoint of aim, or of a peculiar, if intangible, influence it exercises upon those devoted to it. This end and effect are more easily stated from the negative side than from the positive side. Some would call it scholarship and would say that higher education, as distinctly representing the liberal interest in education, should be given to the promotion of scholarship. Among those representing this idea there is, however, a marked difference of attitude. Some would include research and discovery in the province of scholarship, while others would exclude them as specialized and technical. Many deny the claim of scholarship to represent the cause of liberal education and would substitute a specific refining and ennobling of the mind known as culture. However, the status of various subjects with respect to their power to bestow culture is involved in much uncertainty and polemic discussion. Negatively, the conventional idea of a liberal education is more easily made out. It excludes education designed to prepare one for any special calling, particularly if this calling is closely associated with money making, or if preparation for it involves much manual manipulation and dexterity — such as the laboratory pursuits of a technological education. Latterly, it has been held by professed upholders of the cause of liberal education that it is opposed to education for social service. This notion, however, is mainly an American innovation. Historically, the chief pursuit of the leisure class has been statecraft and diplomacy. One of the leading marks of lib-

eral studies was that it prepared men for managing the state, including the lower classes. In the United States, with the development of democracy, the notion of a special ruling class with a special education fitting it for social control has disappeared. Accordingly education for social service is no longer education for directing the affairs of other people, but for contributing to their happiness and well-being. Such a conception would let in the physician and the engineer. Consequently it is too broad for the purposes of the traditional notion of liberal education.

The fact is that in a society which frankly bases its constitution upon class distinctions, it is comparatively easy to assign a distinct content and a distinct purpose to liberal education. With the growth of social studies, of the democratic ideal, and the increased application of the best scientific intelligence to the conduct of practical affairs, it becomes increasingly difficult to do so. Liberal education becomes a name for the sort of education that every member of the community should have: the education that will liberate his capacities and thereby contribute both to his own happiness and his social usefulness. It has value as a limiting concept to criticize various educational schemes. Thus an education in Latin and Greek may be quite illiberal if pursued by methods which restrict the play of the imagination and the sympathies, and bind down mental appreciations to one limited sphere. The same is obviously the case with education for law, medicine, engineering, or the clergy. In short a liberal education is one that liberalizes. Theoretically any type of education may do this. As matter of fact, all of them fall much short of accomplishing it, some in one respect and some in another. In so far they fall short of being an education in any worthy sense of the word.

See ACTIVITY; CULTURE; HUMANISM; LIBERAL ARTS.

LIBERIA, EDUCATION IN. — Liberia is an independent negro republic under the control of black men, and has maintained its sovereignty for sixty-four years. It extends 350 miles along the coast of West Africa and 200 miles into the interior, and possesses thirteen ports of entry. The population is above one and a half million, of whom 25,000 are emigrants from the United States and their descendants. Planted by the American Colonization Society in 1817, Liberia declared its independence in 1847. In language and institutions the leading people are strongly attached to the United States.

The American-Liberians exercise ever increasing authority over the aboriginal tribes, which, however, are dominated by several native chiefs. A strip of land twenty to eighty miles broad extending along the Atlantic coast is effectively administered by the govern-

ment, which is modeled on that of the United States. The coast region is divided into four counties, Bassa, Sino, and Maryland, each under a government superintendent, and Montserrado, which is subdivided into four districts, each under a superintendent. This local organization has facilitated the progress of public education. The government system is based upon an act of 1869 providing for the maintenance of at least one public school in every settlement and township in each county. The act called for an annual appropriation of one thousand dollars from each county treasury to be applied to the support of public schools, and the levy of local taxes for the same purpose. By a second act of the same year the legislature created an Interior Department charged among other duties with the educational interests of the republic. A supplementary law provided for the appointment of a commissioner of education in each county, subject to the Secretary of the Interior. Prior to 1869 missionary societies had been actively engaged in efforts for the instruction and elevation of the people of Liberia, and the two principal church associations represented in the field, the Methodist Episcopal Church of the United States and the American Protestant Episcopal Church, had already made great progress in establishing schools when the government system was inaugurated.

In 1900, or thirty-one years after the passage of the first education act, the government was excited to new effort in this matter, and the legislature provided for the appointment of a superintendent of public instruction charged with the immediate direction of public schools throughout the country. Specific regulations were at once issued for the guidance of teachers and local school officers. The provision for a local school tax had proved futile, and the legislature assumed the support of the public schools by an annual appropriation.

As to the actual provision of schools in this republic, the latest reports give the following particulars. The Methodist Episcopal Church maintains schools in every county, having a little more than a thousand pupils on their rolls, including aborigines and Americo-Liberians. The former comprise about 57 per cent of the total number, and their ratio is steadily increasing. The central school of this system is the College of West Africa, located at Monrovia. It was founded in 1835, and accommodates about a hundred students in the several departments, theological, collegiate, and preparatory. Special provision is made for industrial training. Many of the leading men and women of the country, including a large number of efficient teachers, were educated in this institution. The Protestant Episcopal Church maintains many schools, which center about four principal institutions; namely, Epiphany Hall, at Cuttington, Cape Palmas, comprising a high

LIBERIA

school, collegiate department, and divinity school; a girls' school and orphan asylum at Mount Vaughan, near Cape Palmas; St. John's School, for boys, at Cape Mount, and a school for girls at Clay-Ashland. The latest statistics show a total of fifty schools in this system, of which twenty-seven were for day pupils only and twenty-three boarding schools. The enrollment in the schools in 1905 was about 1500, of which number 74 per cent were native Liberians. The schools of this system are under the close supervision of a resident bishop. The average annual salary of the teachers ranges from \$150 to \$300, which exceeds the average in other mission schools. The Lutheran Church also maintains a few schools among the native Africans at the Muhlenberg station.

The government school system in each county is under the direction of a local school commissioner. The latest statistics give a total of 102 schools, each under a single teacher, and a total enrollment of 3320 pupils, of whom about one fourth are aborigines.

The chief national institution is Liberia College at Monrovia. The institution was founded by the efforts of the Massachusetts Colonization Society, and was placed under the control of two boards of trustees, one representing the society and the other the legislature of Liberia. The college building was furnished by the Boston board at a cost of \$20,000. Liberia gave the twenty acres which form the campus of the college and a grant of 1000 acres of land in each of the four counties of Liberia as an endowment. The college was opened for students in 1862, and after varying fortunes passed to the sole control of the republic in 1890. Since 1900 the income of the college from public sources (taxes and endowment) has averaged about \$25,000, annually, and additional funds are also supplied from America. The college has the benefit of several public scholarships endowed in the names of men who have rendered unusual service to the country. The latest statistics show a registration of 120 students, including both young men and young women, and a corps of twelve instructors. The college is the alma mater of the most prominent citizens of the country, among the number being the former chief executive, Honorable Arthur Barclay.

Industrial education is a feature of both denominational systems. At the White Plains' school and the Sinoe River Industrial School, sustained by the Methodist Episcopal Church, students are taught building, woodwork, masonry, brickmaking, farming, and the cultivation of cotton, ginger, and rubber. The College of West Africa has a printing department, in which job work is done, and the *Liberia and West Africa* and other papers are printed. Most of the work is done by native Africans. In the college proper the girls are trained also in domestic economy, housekeeping, dress-

LIBRARIES

making, fancy work, and kindred arts. In the Protestant Episcopal schools industrial training is given at the four chief centers of education. At Epiphany Hall students are taught the cultivation of coffee, cotton, and rubber; at St. John's School, Cape Mount, there is an agricultural department, in which rice is raised with success, and efforts are being made to secure facilities for teaching other industrial arts. A beginning has been made in industrial training in the public schools. At Rick's Institute, at Kai-Poo, the work consists chiefly of the cultivation of coffee, and the farm yielded 3000 pounds in 1902, 1600 in 1903, and 1400 in 1904. An excellent printing department has been fitted up at Liberia College, and other industrial work is being gradually introduced.

The American Colonization Society has aided schools in Liberia from time to time, in particular the school at Mt. Coffee, forty miles from Monrovia. This school has been the especial charge of the Mt. Coffee Association of America, of which Dr. Edward Everett Hale was an interested and active member. The Colonization Society, as trustee for a fund left for schools by a Mr. Graham, supports two schools, which bear his name. Graham School, No. 1, is located at Greenville, Sinoe County; reports from teachers beginning with the year 1905, and ending with Mar. 31, 1911, show the total attendance of scholars to have been 1261, Liberian boys and girls, 993; native boys and girls, 268. Graham School, No. 3, is located at Royesville, Montserrat County, the report of the teacher for the five years ending Mar. 31, 1911, shows the total attendance of scholars to be 447, Liberian boys and girls, 243, and native boys and girls, 204. The present President, Daniel Edward Howard (inaugurated Jan. 1, 1912), is emphasizing the needs of improving the public school system, of agricultural education, and of Liberia College. I. M. C.

LIBERTY COLLEGE, GLASGOW, KY. — An institution for the higher education of women, founded in 1874. In 1911 there was amalgamated with it the Florence University for Women, Florence, Ala. Preparatory, collegiate, normal, commercial, music, art, and domestic science departments are maintained. The entrance requirements are equivalent to about three years of high school work. The degrees of B.A., B.S., B.C., and M.A. are conferred.

LIBRARIES. — Historical. — *Babylon and Assyria.* — The temples of the ancient cities

which lie between the Tigris and Euphrates, such as Telloh, Nippur, Sippar, Borsippa, and Nineveh, were administrative and literary centers as well as the shrines of gods. From ten to thirty thousand inscribed clay tablets in each temple preserved official record of battles and of the divinations which foretold success or failure. There were also treatises, petitions, diplomatic letters, laws, deeds, and church rituals. These constituted royal or national libraries, presided over by Nebo the god of learning, and under the care of the king-priest or a high official.

Later when Hammurabi (c. b.c. 2200) became chief ruler in Babylonia, Mardik was advanced to be the head of all gods, and Babylon became the center of records and learning. Hammurabi's famous laws were cut into the wall of the temple. These records and others were brought together by Ashurbanipal (b.c. 671-626) at Nineveh when he became King of Assyria. Copies of inscriptions on monuments of victories and of all national legends were here recorded on clay tablets and cylinders. These were arranged by classes, were catalogued, and indexed by title. Many of those which describe divinations had excellent drawings to illustrate the text. A century later (Ezra v, 17) Darius ordered a search to be made in the hall of books at Babylon for a decree regarding the house of God at Jerusalem.

The temples were great schools, and popular, because preferment, as in the Middle Ages, came through the priestly office. The libraries had many easy texts and vocabularies for boys to study. Ashurbanipal says that he had studied at the temple, probably as a youth.

Egypt — At El-Amarna, the Egyptian capital of the Pharaoh Akhuaton, who tried to uplift religion and free art from convention, much of the national library has been found, composed chiefly of correspondence with provinces and with kings in Western Asia. These archives were in charge of Tetou-nou, an Egyptian, whose assistant was Shamas-Niki, a Babylonian. The hieroglyphic writings of Egypt never supplanted the cuneiform of Babylonia as the language of culture and diplomacy, and Shamas-Niki must have been indispensable. The papyrus plant which furnished food, fuel, and clothing for Egypt became the fragile medium for perpetuating her writings, until parchment or prepared skins came into use. There were many papyrus collections in Egypt (see Richardson's *Some Old Egyptian Libraries*, 1911); but the great library at Alexandria grew up under foreign influences, the product of one of many long periods of foreign domination of the Nile valley.

Greece — Greece left records of books, book selling, and schools, but little of libraries. Demetrius Phalerius, poet and orator, honored with as many statues as there are days in the year, fled to Alexandria, and there advised Ptolemy in his plans for a great library, al-

though Aristotle is said to have aided in the arrangement. Aristotle's own library (*Strabo* XIII, 1, § 54) passed to Theophrastus and from him to Ncleus of Scepsis, where it lay hidden to escape the rapacious bibliophile kings of Pergamum until bought by Apellicon of Athens. Sulla the dictator and book-lover carried the collection to Rome to have its texts copied and spread abroad.

From Ephesus, where, we are told, there was a book chained to the door of Diana's temple, came Zenodotus (b.c. 280) to manage the Alexandrian library, to walk in its colonnades with peripatetic teachers, and to dine in rooms set apart for its students. This was the mother library, distinguished thus from the daughter library in the temple of Serapis. The older collection was in part destroyed by Cæsar, but Antony gave 200,000 manuscripts of Pergamum to Cleopatra for the Serapeum. Of this great library fleeting and uncertain glimpses appear in 391, when Theodosius ordered its destruction, a generation later when Orosius says that he saw ancient books in Alexandria, and in 640, when Amrou, the great caliph Omar's lieutenant, is said to have used the remnant for fuel.

Rome. — M. Terentius Varro, author of a work entitled *De Bibliothecis*, now lost, was commissioned by Julius Cæsar to collect books for a library. Under succeeding Cæsars Rome became a city of libraries, to which students of the many schools of oratory and philosophy resorted. Telephus, a grammarian of Pergamum in a.d. 117, is said by Suidas to have issued a *Notitia librorum* which described minutely the libraries of his time. Forty years earlier Crates, ambassador from Pergamum, probably stimulated an interest in libraries while lecturing on grammar at Rome. C. Asinius Pollio, the general, poet, and friend of Vergil and Horace, founded the first library in Rome from spoils of his Illyrian campaign, b.c. 39. Pliny calls him "the first to make men's talents public property," but Plutarch claims this honor for Lucullus.

The Porticus Octavia, a typical Roman library between the Capitoline Hill and the Tiber, was founded by Augustus. It has temples to Juno and Jupiter, connected in the rear by a long schola, or hall for conversation. A space of equal length behind the schola had three divisions, a middle section, the curia, devoted to meetings, with the Latin library at the left and the Greek library at the right. About this compact building there was a double colonnade 443 feet by 377 feet, to provide, as at Alexandria, a meeting place for master and pupils. Rome had nearly thirty libraries, to which Vespasian and Trajan made large additions. Their manuscript rolls were kept in bookcases or presses, inlaid, and surmounted by busts, unless there were portraits on the walls. There was usually a director with a subordinate in charge of each language. Men like Lucullus

lavished money on their libraries until Seneca spoke bitterly of books as "ornaments of dining rooms," reaching to the ceilings. He adds: "Nowadays a library takes rank with a bath-room as a necessary ornament to a house. I could forgive such ideas if they were due to extravagant desire for learning" (*De tranquillitate animi*).

Middle Ages.—Christianity did not alter the form nor greatly abate the luxury in libraries. Eusebius, in his *History*, speaks of Bishop Alexander's library at Jerusalem (A.D. 250) as a storehouse of knowledge. St. Jerome worked in the library of Pamphilus in Caesarea in Palestine, and calls the founder a rival in zeal of Demetrius Phalerus and Ptolemy the tyrant. In the early Christian Church the apses on either side of the altar were used to store the altar vessels and ritual books. Thus one apse came to be used as a religious or monastic library. Christian enthusiasts retreating into the deserts and mountains to escape luxury needed books to keep themselves from ignorance. From them first came primitive library rules. Those of St. Pachomius (A.D. 292-345) were developed near Denderah in Upper Egypt. St. Benedict perfected library administration, and his successors influenced the government of early college libraries (Clark, *Care of Books*.) Monte Cassino, Saint Gall, and Cluny are examples of these Benedictine libraries.

In the manuscript era the monks of monastic libraries were also publishers and booksellers. The Abbot Loup of Ferrières kept a depot for books at St. Josse-sur-Mer. Others were at Wearmouth and Yarrow. Becker estimates that from A.D. 750 to 1200 there were 136 libraries in monasteries, with about 12,000 books in all. Of these about thirty were complete Bibles.

The two great figures in medieval learning were Cassiodorus (q.v.) and Alcuin (q.v.). Cassiodorus maintained a scriptorium where his monks copied the classic authors. Alcuin simplified the forms of written letters and stimulated scholarship. There are many woodcuts of the early years of printing which depict the monk in his library or scriptorium. Cassiodorus said, "As the antiquarian copies the words of Christ, so many wounds does he inflict upon Satan." Here was the inspiration of medieval book making. Some of the best work was done by the Benedictine nuns, and trial pages written by nuns of St. Mildred's Abbey, Isle of Thanet, still exist.

By a law of recompense, the era of fanaticism that effaced or destroyed many manuscripts was followed by the age of printing. Books became cheap, and libraries leaped from a hundred to a thousand volumes. The scriptorium lost its influence, however, as a part of the monastic library. The *Ars Moriendi*, the *Biblia Pauperum*, the rude picture book of the Bible story, and the *Donatus* or popular grammar, were multiplied beyond the dream of

Cassiodorus. Then movable type came, and the modern library was inevitable. Before the voyages of Columbus there were printing presses in 236 cities in Europe, with over a thousand printers. A million books were issued with good ink on durable paper before the end of the fifteenth century. The Bible, following Christian missionaries into every country, taught the world to read. "Some," said Fox, "gave a load of hay for a few chapters of St. James or of St. John in English."

Richard de Bury (q.v.), who finished his *Philobiblon* in 1345, shows forth the spirit which governed cathedral and university libraries in England. The general attainment of learning had grown to such proportion that Bishop Carpenter's librarian at Worcester in 1464 was required to be a graduate in theology and a good preacher. It was his duty to explain hard passages in the Bible, make lists of the books in his keeping, and examine the shelves each year on the Friday after the Feast of Relics (in January). At St. Martin's, Dover, now part of Dover College, the administrative details, worked out very thoroughly, have been preserved. At Pembroke College the titles of books were written on parchment attached to the left half of a board. The right half was covered with a thin layer of wax, on which the name of a borrower might be scratched in line with the book's title. The borrower deposited a "pledge," sometimes the value of the book, or an agreement in writing.

Education in 1400 is reflected in the character of college libraries in England. Theology and kindred subjects claimed three fourths of all the college books, with one fourth devoted to grammar, poetry, music, medicine, arithmetic, geometry, and astronomy. The proportion was not materially altered in colonial New England, but in the Southern colonies private libraries reflected a later and broader taste.

Great Libraries Founded in Early Modern Period.—The Vatican library at Rome has historic origins in church records dating from the second century, and was associated in the fourth and fifth centuries with Popes Damasus and Hilary. With Boniface VIII, a true pontifical library began, when he ordered a catalogue to be made in 1295. These books were scattered in the fourteenth century, some going to Assisi, where they may still be seen. Nicholas V (1447-1455) was a book lover, collecting for the common convenience of all learned men, and fifteen years later Sixtus IV provided a building for the new collection, appointed Platina as librarian, and made the modern Vatican library a reality. From 1475 to the time of his death in 1481, Bartolommeo Platina fitted his library with banchi and wall cases, added paintings by Ghirlandajo and Melozzo da Forlì, and catalogued the books. There were the Latin and Greek rooms, the *Bibliotheca Secreta* and the *Bibliotheca Pontificia*. Platina and his three pages slept in an adjoining room.

Juniper was used to fumigate, fox tails to dust, and brooms to sweep the library. A notice of the time of Julius II asked readers not to quarrel nor to jump over the desks. A pleasant description of the library will be found in Montaigne's *Travels in Italy* in 1581. Scholars were first admitted in 1888. Much might be said of the Laurentian library at Florence and of the origin of old collections in other parts of Europe. The familiar print by Woudanus in 1610 of the library of Leyden University represents gentlemen with their hats and cloaks on, followed by dogs, going from case to case to consult the chained books.

Edwards, in his *Memoirs of Libraries*, has given the story of the plundering of monastic libraries in the sixteenth century, when manuscripts were used to light candlesticks, to rub boots, and to wrap grocers' bundles, "and some they sent over sea to the bookbinders, not in small number, but at times whole ships full, to the wondering of the foreign nations." Books are still found with pieces of written parchment used in the bindings. In some college libraries the desks were sold since no books remained.

A century later a great need stimulated renewed interest in book collecting. Humphrey Chetham in 1651 saw the value of "godly English books, proper for the edification of the common people," and founded chapel libraries and a town library in Manchester. The Reverend Thomas Bray, whose life was one of amazing energy and results, promoted deanery and parish libraries all over England and parish libraries in the English colonies to preserve the clergy from ignorance.

The British Museum had its origin not as a hall of official records, but in three great collections illustrating English history. The death of Sir Hans Sloane in 1753 brought about the act (26 Geo II, 1753) for the purchase of his treasures of art and books, together with the Harleian manuscripts, the two collections to be united with the Cottonian manuscripts, already the property of the nation, under a board of trustees. The British Museum was opened as Montague House in 1759, the Royal Library of the Kings having meanwhile been given by George II. The romantic career of the late Sir Anthony Panizzi, Italian refugee, librarian and scholar, resulted in placing the British Museum in the front rank. "He governed his library as his friend Cavour governed his country," wrote Dr Garnett, "perfecting its internal organization with one hand while he extended its frontiers with the other." The printed catalogue, from troubled beginnings in 1834, is now complete, and represents a great bibliographical achievement, closing with the year 1900. Of earlier origin, the Bodleian library at Oxford, opened in 1602, was the first "public" library in Europe; the second was that of Angelo Rocca, opened at Rome in 1604. The John Rylands Library at Manchester, begun in 1890, took high rank two years later

when the ancient Althorp Library of the Earls Spencer was purchased. This collection, associated with the genius of Dibdin, illustrated by examples the whole range of the history of printing.

The Bibliothèque Nationale in Paris can be traced to a collection of records in the Louvre in the time of Charles V. Guillaume Budé was the first *Maître de la Librairie du Roi* in 1544, and in 1556 a copy of each book printed in the country "with privilege" was by law deposited in the library. For several centuries two library families, the De Thou and the Bignons, held a sway of varying power, building up the collection by unceasing labor and foresight. In 1721 the books were removed to the Palais Mazarin, the Bignons serving as librarians from father to son from 1642 to 1784. The revolution sent its spoils of churches and country houses, swelling the accumulations of centuries to a total of nearly three million volumes. A catalogue is now (1912) being printed.

All the important countries of Europe have royal or national libraries, varying in size and administrative efficiency. The Imperial Library at St Petersburg, with over a million volumes, is one of the most valuable in the world, and is freely open to scholars. In most cases, however, the great libraries of the continent are the accumulation of time rather than of systematic effort; and from them down to the humblest civic collection there is rarely any liberal control comparable to that which is everywhere characteristic of American libraries.

America. — For two centuries at least after the arrival of Winthrop in Massachusetts Bay, Boston was the literary center of the English colonies. Her clergy and her civic rulers could not be content without writing as well as reading books. A library established in the Town House at Boston through the will of Captain Robert Keayne, dated in 1653, was composed of books in English, and the idea may have been suggested by the small municipal collections formed at the English Norwich and elsewhere as early as 1608. New York owes its advent into library history to Reverend John Sharpe, chaplain at the fort, who proposed in 1712-1713 a public school, a public library, and a catechizing chapel. The library was to be free to all. Sharpe's books, and those of the corporation library of 1728, sent over by the Society for the Propagation of the Gospel, together with the much finer collections of the New York Society Library, founded in 1754, were all swept away during the Revolution.

Franklin once said that in his boyhood there was not one good bookstore south of Boston. When a lad, he went to Philadelphia and projected there in 1731 the first subscription library in the colonies. Franklin says: "I set on foot my first project of a public nature, that for a subscription library. . . . I was not able, with great industry, to find more than fifty persons, mostly young tradesmen, will-

ing to pay down for this purpose forty shillings each, and ten shillings per annum. On this little fund we began." This collection eventually became the Philadelphia Library Society, and half a century later was strengthened by adding the Loganian library, which had been founded in 1745 through the generosity of James Logan, famous as the secretary of William Penn. The Redwood Library, established in Newport, R. I., in 1747, belongs to this period. A similar library, also an institution for self-improvement, was begun in the following year by some seventeen young men of Charleston, S. C.

As early as 1774 the *Connecticut Courant* made the assertion that the need of public libraries was "too manifest to be denied"; but up to 1850 the public library had no such character as it has to-day. It is true that Boston and New York made spasmodic attempts at city libraries, but in reality the only libraries during this time were the Bray or parish libraries, mostly unused, and the subscription libraries, which flourished because they were near by and were not necessarily self-sustaining.

The first ten years of the nineteenth century, influenced by the conditions in France, show a great intellectual awakening. Clubs of all kinds, and especially learned clubs, sprang up, and almost all had a reading room or a library. From this beginning many atheneums or scholars' libraries came into being, from New England to Georgia.

During this same period the establishment of state and national libraries was begun. New Hampshire, the pioneer, had a colonial library as early as 1770, which was reestablished as a state library in 1818. New Jersey followed with a library as early as 1796, though it was so much broader in scope that it has served as a type to guide many later state libraries. It was a sufficiently elastic model to allow for the changes which time and varying conditions have imposed, enlarging the original conception into a far wider idea of its duty to the people, than that of a merely legislative function. South Carolina, Pennsylvania, and New York, the best known of the early state libraries, were all founded before 1818. In 1800 the national government established a library. Its beginnings were so small that its first catalogue (1802) was hardly necessary. When the British took Washington in 1814, the library was burned, and twice since, in 1825 and 1851, fires have occurred. Jefferson's library was purchased in 1815, and was the first of many famous collections to be added. The Library of Congress now aids her libraries through printed catalogue cards, bibliographies, and other material.

All these were tendencies away from libraries which were under private control, and the tendency became more marked when towns like Salisbury in Connecticut (1803) and Peterborough in New Hampshire (1833) established libraries with town funds. These

foreshadowed the true public library, but it was not until George Ticknor of Boston grasped the significance of the great benefit that would come when books were free to all, that the movement came to its fruition. The first convention of librarians was held in New York, Sept. 15-17, 1853. The fact that fifty-three delegates were present shows how great was the awakening, both among scholars and among librarians.

In 1848 William F. Poole printed a modest index to the many periodicals which had become useless and because of the impossibility of finding the material hidden there. This was the origin of Poole's *Index*. At about the same time other men came into prominence in the library world, which at this time centered around Boston. Jewett failed to create a National Library, came to the Boston Public Library (1855), and made himself widely known by his rules for cataloguing. Thirteen years later Justin Minor succeeded them. At this time Poole was about to go to Cincinnati, and Cutter prepared to succeed him as librarian of the Boston Athenæum. These men and many others met in Philadelphia in 1876 and founded the American Library Association, with the *Library Journal* as its organ.

Recent Development. — *Scientific Library Management*. — Edwards (*q. v.*), Panizzi, and Ewart (*q. v.*) in England, and the leaders in America laid the library world under a debt hard of comprehension in the present day of universal progress. Library devices of all kinds were being perfected and improved at this time on both sides of the Atlantic. New rules for cataloguing were being tried, and Dewey and Cutter were bringing to perfection their system of classification. See **LIBRARY CLASSIFICATION**.

Women at this time had little connection with libraries, but this has grown greater as their sphere of activity has grown wider. Mrs. Anne Waddell, a woman of affairs in New York, was named in the charter of the New York Society Library in 1772. During the first half of the nineteenth century women's sole literary interests were such as might be derived from the circulating libraries in the stationers' or bakers' stores. A few very erudite scholars were allowed to use the libraries of general literature; but the general attitude of mind toward such use was reflected by Charles Folsom, who protested in 1855 against women having access to "the corrupter portions of the polite literature."

In 1850 Harvard had 68,000 volumes, the largest collection in America, the Library of Congress about 46,000, the New York Library Society 30,000, and the Library Company of Philadelphia 55,000, the second in size. To-day these would not seem large collections for any prosperous town.

The library movement in the United States is indebted to many forces for its success. The

Mathers, Prince, Sharpe, and others of the colonial clergy fostered the collection and care of books. Franklin, a great social and scientific factor in our development, emphasized the library as an aid to the skilled laborer. Following the American Revolution and its period of inaction, French ideals had an awakening impulse, caught up and carried on by the far-reaching lyceum system of rural lectures. No doubt also the articles by Edward Edwards and the speeches of Ewart had their echo on this side of the Atlantic. Certainly the *Report of the Commissioners*, appointed by the House of Commons to inquire into the constitution and government of the British Museum under Panizzi, and published in 1850, must have interested and aroused men interested in books, in administration, and in social forces.

Library Legislation. — An enlightened opinion has in some states forced special library legislation; but more often a few devoted men have obtained the laws that in time create a regard for libraries. The library law of New York, passed in 1835, under which a school district could raise a sum of money for the purchase of books, established the principle of taxation for the support of libraries. New Hampshire passed a very simple library law in 1819, with no limit as to appropriation and no conditions as to management. Massachusetts enacted in 1851 a brief law under which libraries multiplied rapidly in the commonwealth. Maine in 1854 passed an unsatisfactory law, permitting the levy of a dollar on each ratable poll to establish libraries, and twenty-five cents per poll for maintenance. Vermont did little better in 1865. The Ohio law of 1847 tied the library to the educational system. In 1872 Colorado passed a good law, and Illinois devised an elaborate and thoroughly satisfactory act which has influenced many states, New Jersey, Wisconsin, Michigan, California, Missouri, and others. Some sections of the country were for a long time very backward in library legislation, including Connecticut, Pennsylvania, and even New York, where the fairly convenient school district system was not altered till 1892.

The State Library Commission, which was established by Massachusetts in 1890 to foster town libraries, set an example that has been followed throughout the country; with increasing powers and a firmer conviction of the work to be accomplished, state commissions have grown in importance and in the scope of their work for library extension. In many states the cooperation of the state commission and the state library has made the use of books a vital and far-reaching force for intelligent citizenship.

Library history in the United States has been of short duration, but, with no traditions to forget and no customs to break, progress has been rapid. History, as far as it has been made, has had less of the dignity of mere age and more of the fruit of radical achievement. One has only to study

library history in France, Germany, or Italy, to realize that what has been done in the United States toward establishing an intimate relationship between good books and the social life of all classes has been pioneer work.

Free Public Libraries. — Library progress in the sociological sense must be studied in three sections. England, although handicapped by inability to free her library and museum property from taxation, began before 1850, under able leaders, her campaign for free libraries. America, recognizing early the right to levy taxes for the establishment and maintenance of public libraries, made greater progress along seemingly radical lines. The Continent, crippled by social and economic conditions, has only very recently welcomed modern ideals.

In 1700 John Evelyn said that Paris had more libraries than were in the three kingdoms of Great Britain, and Gibbon declared in 1800 that no scholarly work could be done in English libraries. A conference at Manchester half a century later agreed that since Gibbon's day little improvement had been made, and William Ewart was asked to begin a parliamentary fight for a library law. The bill of 1845 "for encouraging the establishment of museums in large towns" was passed; it allowed half a penny in the pound to be levied for land and buildings for museums in large towns, but no specimens or books could be bought. Edward Edwards, for many years on the staff of the British Museum, took up the study of library conditions at home, on the Continent, and in the United States, embodying his researches in articles published in 1847 and 1848. Ewart then brought in a bill, which met with vigorous opposition and the most absurd arguments before its passage in 1850. This act was permissive for towns of 10,000 inhabitants and over, kept to the same inadequate rate, and made no provision for the purchase of books; but it was distinctly for libraries as well as for museums, although the latter have always overshadowed public libraries in English legislation. Subsequent acts advanced the rate to a penny, allowed the purchase of books and newspapers, permitted money to be borrowed for the erection of buildings, and extended these privileges to Scotland and Ireland. So great was the confusion arising from conflicting library acts that in 1894 they were consolidated, making a nearly uniform law for the United Kingdom.

The rate limit has hindered library progress, and taxation of library property has still further decreased the net return from a rate already too small for healthy growth in populous communities. London, with no central government until 1899, has had a slow development. English libraries in early days depended too much on mechanical devices; the librarian was a custodian and clerk rather than an administrator, and his influence was limited. Until recently there have been no training schools for young men and women who fill the minor places,

so that these have been less intelligently managed than large libraries which could tempt officials from the British Museum. An American is apt to think that the English librarian does not trust his public enough, that he does not do enough for schools, for rural districts, and in the way of coöperation with neighboring libraries. The Englishman considers our classification on the shelves too close and too inflexible, and he experiments cautiously with the many social plans by which Americans bind the community to the public library.

In America Ticknor set the pace for library progress when, in 1851, he spoke of his aim for the proposed public library in Boston: "I would establish a library which differs from all free libraries yet attempted; I mean one in which any popular books, tending to moral and intellectual improvement, shall be furnished in such numbers of copies that many persons can be reading the same book at the same time; in short, that not only the best books of all sorts, but the pleasant literature of the day, shall be made accessible to the whole people when they most care for it, that is, when it is fresh and new."

But even in America the free public library has come with wise slowness into favor. As late as 1876, when one hundred and three delegates met at a conference of American librarians, only fourteen represented institutions of the modern free public library type. Libraries maintained by shareholders and by annual subscribers still predominated. With the rapid advance of the free library the scope of its work along social lines has become a subject for debate. We are not far from that condition referred to in 1850 by a member of Parliament who prophesied that the working classes would soon be asking for "quoits, peg-tops, and footballs." Sunday opening, first tried in Cincinnati in 1870, was an early step in the radical movement in America. Work with children, now recognized as essential in a good library, attempts to attract and hold the young when they first learn to read. Indeed, story telling and games are introduced in branches of great city libraries to win the very young and the foreign born. University extension lectures, given on certain evenings each week and on Sundays, bring older people to the building and give them predestined treasures from books and art. More liberal rules for the circulation of books (the two-book system and special cards for teachers), free access to the shelves or to special standard collections, and even free delivery from library to home, all illustrate the endeavor to make the free library indispensable.

A distinct effort is now made to educate taste in architecture by new ideals of excellence in buildings; but the façade follows the plan and is not merely a pleasing exterior. Books on library planning fortify the librarian against the inexperienced architect who desires effect only.

Library Methods.—The American missionary spirit, radical though it may be, has had its

influence in the old world as well as in the conservative communities of the new. Certain mechanical improvements, such as the decimal and expansive systems of classification for placing books on the shelves, indexing the books of the library on cards instead of in ledgers, making a charging record for books taken out of the building so that statistical information may easily be compiled, and uniform cataloguing rules, adopted in preparing cards to be issued by the Library of Congress, are revolutionizing the routine of library administration. The librarian, while he may still be a "missionary of culture," must recognize that his vocation calls for business ability.

English and American methods, though differing, are not fundamentally divergent after all. The Continent, however, can show little enlightened library development outside a few isolated examples in Holland, Switzerland, Germany, and Sweden. In Germany the dual library system, a *Stadtbibliothek*, or sleepy municipal library in the main street, and a *Volksbibliothek* or cheap fiction library on the side street, has delayed the coming of the all-round large public library. Social club libraries also have satisfied the more intelligent members of the community, who are bound together by a love for art, music, archæology, or science.

France has few cities where the public seem to want libraries, and zeal is not expected from poorly paid librarians. The scholarly librarian, however, still survives in some historic French towns. What France lacks in organization Italy carries almost to an extreme. A library assistant in Italy can be transferred from city to suburb or to a distant city, finding the same system everywhere. In the northern countries of Europe people's libraries are still parish charities, except where Miss Valfrid Palmgren, through addresses and writings, has introduced American methods and aims. The censorship in Russia has crushed library progress there, and throughout many square miles no books are accessible to the public. The works of a contemporary poet under the ban of the censor could not be found in a library which honored him by bearing his name. Still, in Russia, and in Siberia, interesting little libraries may be found where a librarian has been born for the task, undismayed by conditions which prevail all about him.

Germany and Switzerland have attempted catalogues on a great scale; but in most European capitals the catalogues are inaccessible, or inadequate, and the service is very slow. Munich, Stockholm, and Brussels have been famed in the past for helpful employees and convenient appliances; but administrators die and policies change. The real library movement is to be seen at Charlottenburg and Essen in Germany, at Dordrecht and Groningen in Holland, at Stockholm, and at several other places where modern methods are but just coming into vogue. Foreign scholars have

attended English and American library conferences, and have admired what they saw, but they have been slow to believe that these radical methods could be made successful in Continental cities. They are, however, very gradually making the experiment. C. K. B.

School Libraries. — *District School Libraries.*

— The district school library movement antedated the modern public library movement in this country by about forty years. Its original impulse came from educators who saw that if the State was to gain intelligent citizens, as a result of its investment in education, the young must not only be taught reading, but must be given good books to read.

New York was the pioneer, and a law was passed in 1835 permitting the voters of any school district to levy a tax of \$20 to start a library, and \$10 annually to maintain it. This permission failing to appeal to the rural taxpayer, the legislature of 1838 passed a law appropriating \$55,000 annually for the establishment of libraries in every school district of the state, with the provision that after three years the money might be spent for books or for teachers' wages, at the discretion of the district. These were not to be strictly school libraries for the use of the pupils alone, but were also intended for the use of the people of the district.

The example of New York was followed by Massachusetts, which, through the efforts of Horace Mann (*q.v.*), passed in 1835 a permissive school district law, and in 1842 added the stimulus of a state appropriation of \$15 to each district that should raise an equal amount.

Following the lead of New York and Massachusetts, seventeen states passed more or less effective laws providing for district school libraries, as follows: Connecticut, 1839; Rhode Island and Iowa, 1840; Indiana, 1841; Maine, 1844; Ohio, 1847; Wisconsin, 1848; Missouri, 1853; California and Oregon, 1854; Illinois, 1855; Kansas and Virginia, 1870; New Jersey, 1871; Kentucky and Minnesota, 1873; and Colorado, 1876.

The results of this legislation were in the main disappointing. Jewett's *Notices of public libraries in the United States*, published by the Smithsonian Institution in 1851, reports 9505 public school libraries in all, containing 1,522,332 volumes, of which 1,338,848 volumes were in New York, 91,539 in Massachusetts, 47,220 in Michigan, and 19,637 in Rhode Island; no other state reporting more than 10,000. In the Bureau of Education's special report on libraries in 1876 the total number of volumes in school libraries had declined to 1,365,407. In New York State, where alone the school libraries were very generally established, the number of volumes in libraries fell from over 1,300,000 in 1851 to 825,000 in 1892, and most of the annual appropriation had come to be devoted to general school purposes.

Success of the Movement. — Two reasons are usually assigned for the comparative failure of

the school library movement in the country. First, defects in legislation; many of the states failed to give state aid or gave it only intermittently or failed to provide for the supplementing of state aid by local taxation, thereby keeping up local interest in the libraries. Second, defects of administration; there was seldom any supervision over the selection of books, and the local school authorities were not accountable to any central authority for the management of the libraries. But underlying both of these reasons was the fact that this early school library movement was strictly a school enterprise. The educators originating it did not realize that books alone do not make a library, and that only where organized into libraries do masses of books become available for use. To be efficient a library should be well chosen, classified by subject, the contents of the books brought out by analytical cataloguing. The books need to be mended and rebound; they should be charged when in circulation, both for safety and in order that their use may be recorded. All this is a librarian's business, not a teacher's; and in the forties and fifties librarians themselves had not yet worked out methods of efficient library administration, — library science was in its infancy.

American librarianship did not become an organized profession until 1876. By that time the great increase in the number and size of libraries in the country (from 694 libraries with 2,201,632 volumes in 1851 to 3647 libraries with 12,276,964 volumes in 1876, exclusive of school libraries) had forced librarians to create more uniform, economic, and efficient methods of administration, and for the first ten or fifteen years the sessions of the American Library Association were largely devoted to questions of library technique, — cataloguing, classification, charging systems, shelving, etc. Very dry and uninspiring subjects, but thanks to the fine quality of thinking expended on them and to the *esprit de corps* that put every improvement at the disposal of the whole profession, these problems were solved so successfully that the enormous expansion in the number and size of libraries during the last twenty-five years was accomplished easily and has been accompanied by an even greater expansion of use. According to the Bureau of Education *Reports* there were in 1884, 2988 libraries of over 1000 volumes in the United States, containing in all 12,376,473 volumes, with a total circulation of 10,899,469; in 1908 there were 5640 libraries, with 62,628,541 volumes and a circulation of 82,222,584. In other words, while the libraries have doubled in number, their size has multiplied by five, and their use has increased nearly eightfold.

With problems of library administration in a fair way to be settled, librarians next turned their attention to improving the quality of books in the libraries. Principles of book selection were evolved, and bibliographic tools for the evaluation and selection of books were forged, a partial

list of which will be found appended. With these methods and tools librarians were now equipped to aid educators in their endeavor to make the school libraries a dynamic element in education.

In 1888 Melvil Dewey, who had perhaps done more than any other man to promote administrative efficiency in American libraries, was made State Librarian of New York; and thus the organizing genius of the new librarianship was brought to bear on the unsatisfactory conditions of district school libraries. Mr. Dewey found that the \$55,000 still appropriated under the law of 1838 had been almost wholly diverted to general school purposes; that in many cases the libraries had been dispersed, and that where they survived, the original purpose of supplying books to the people of the school district had been lost sight of, and that the books were regarded as part of the school equipment. A new law drawn up by Mr. Dewey transferred those that had developed into public libraries to the regents of the university, to be carried on in connection with the state library, while the appropriation of \$55,000 (subsequently increased to \$100,000) was continued, but it was specifically directed that it be administered by the Department of Public Instruction for pedagogic and reference books for the use of the teachers and pupils. That rule, however, was annulled in 1910, and school libraries in communities that have no public libraries may be opened to the public. Since 1892 the number of volumes in the school libraries has increased from about 800,000 to 3,135,408 volumes, selected from lists approved by the state authorities and bearing on the state course of study. The state education department reports that the libraries are well cared for; that in some cases the librarian of the local public library supervises the school library, and that in many cases there are trained librarians in charge of the school libraries.

State commissions to stimulate the establishment and to advance the efficiency of libraries have been established in thirty-three states, beginning with Massachusetts in 1891, and in many states the school libraries have come under their influence. In Illinois the library commission lends books to county school libraries; in Minnesota the relation between the commission and the schools is very close, — the commission organizes school libraries and revises the list from which purchases must be made, the state superintendent of education employing a member of the commission's staff to care for school books. In Missouri and Nebraska the state library commissions are also in touch with the district school libraries. In Connecticut the State Library Committee (Commission) is directed by law to assist in the selection, purchase, and administration of school libraries and to lend them books and pictures. In Oregon the library commission is directly responsible for the district school li-

braries. A mandatory tax of not less than ten cents per capita for each child of school age shall be levied by each county having less than 100,000 inhabitants and set aside for school libraries. This is apportioned by the county superintendent, who must report to the Oregon Library Commission the amount apportioned to each district and the number of school children in each district. During July of each year the local school authorities must select from lists prepared and furnished by the library commission such books as are desirable for their district, the aggregate mailing price of which shall not exceed the apportionment. This list must be sent to the library commission by Aug. 10, and the commission buys the books, thus receiving much larger discounts than each library purchasing separately could obtain. If the lists from any districts fail to be received by Aug. 10, the commission shall select the books for these districts. The county superintendent shall appoint a librarian who shall receive and have the care and custody of the books, and shall loan them to the teachers, pupils, and other residents of the district in accordance with regulations prescribed by the commission. When school is in session the library shall be placed in the schoolhouse, and the teachers shall be responsible for its proper care and protection.

A revival of effort to increase the number and improve the efficiency of public school libraries, due in part at least to direct or indirect stimulus from library sources, is felt all over the country and has been reflected in recent legislation. Only eight states (Arkansas, Georgia, Mississippi, New Hampshire, Tennessee, Texas, Vermont, West Virginia) have no school library system established by law.

An analysis of existing laws shows that they fall into three classes, — permissive laws, in which the district is allowed to tax itself for a school library; persuasive laws, in which the state grants aid to the district, usually duplicating the amount raised by the district; and mandatory, in which the establishment of school libraries is required, part of the school funds being set aside for the purpose, and some state official or body, superintendent of schools, or library commission being made responsible for the enforcement of the law.

Only the exceptionally energetic school authorities or progressive communities avail themselves of the privileges granted by a permissive law. When the inducement of state aid is added, the moderately energetic and intelligent will take advantage of it, but a mandatory law, the execution of which is intrusted to state authority, will overcome the inertia of the great mass, and will achieve the desired result of a well selected library in every public school in the country.

The essential points to be covered by a good school law are: — (1) A mandatory minimum annual tax levy by county. (2) Compulsory selection from a well chosen list made by some

recognized and responsible authority. (3) A central purchasing agency and a state contract price. (4) A definite and fixed time for annual purchase. (5) Suitable rules and regulations to prevent scattering of the books.

The Oregon law described on page 15 is especially to be commended as providing all these requirements. A brief résumé of the laws relating to state aid for public school libraries will be found in *Library Journal*, Vol. XXXVII, 1912, pp. 312-315.

School Libraries in Towns and Cities.—School library legislation has in the main concerned itself with the problem of the country school, while library work in city schools has largely developed along the lines of cooperation between the public library and the schools.

To-day practically all of the public library systems in the cities of the United States have organized school departments through which classroom libraries are placed in the schools. In Buffalo the public library has placed 828 libraries in the grammar schools of the city, from which 418,753 volumes were circulated in 1910. In St. Louis traveling libraries are sent to the grade schools. In 1911, 176 traveling libraries containing in all 101,759 volumes, were sent to schools, and deposit stations are established in ten school buildings in which 59,238 volumes are placed. The Cleveland Public Library appointed a supervisor of classroom libraries in 1906, and the use of classroom libraries is being developed as rapidly as the resources of the library will permit. Detroit sends books for supplementary reading to the schools, circulating 77,869 volumes to school children in 1910. In Pittsburgh a catalogue of books for the use of pupils of the first eight grades was published in 1902 by a committee of teachers and librarians. A second, revised edition was published in 1907. Books are sent to 108 schools; about 100,000 volumes are circulated for home use yearly, and nearly twice that number used in the classrooms. The Newark Public Library has a school department, maintains a reference room containing books and periodicals for the use of teachers, and sends about 500 traveling libraries to classrooms.

The State Board of Education of New Jersey decided in 1911 that in all communities having free public libraries the board would recommend, subject to the approval of the local board of education, that the school library be administered by the public library, the circulating books, both fiction and nonfiction, becoming part of the working collection of the public library, with a distinguishing label, "Bought from the school library fund"; the pedagogical and strictly reference books are to be left in the school buildings where desired. The public library, on the other hand, must agree to furnish such books to the schools as may be needed in school work.

In New York City the work of supplying

classroom libraries is carried on by the board of education. This work began in 1893 before the consolidation of the several privately endowed and maintained libraries of the city into the present efficient public library system. In 1903 the board appointed the head of school work in the Buffalo Public Library as superintendent of school libraries of New York City. There are in 1911 more than 12,000 classroom libraries in the system, containing from thirty to forty books each, and with a circulation of about 8,000,000 volumes a year. There are also teachers' reference libraries in each school building.

The New York and Brooklyn Public Libraries supplement these school libraries by sending traveling libraries to the schools on request, and the New York Public Library has a school department which promotes reference work with the schools in the neighborhood of each branch of the library.

High School Libraries.—In an article in *School Review* (Vol. XIV, p. 762) it is stated that "In every city school building there should be set apart as a library one large room furnished with comfortable chairs, in which should be found daily papers, suitable magazines, a liberal supply of the best fiction, travel, popular science, live, unabridged historical narrative, biographical essays. A modern card catalogue should be provided, which the students should be taught to use." A trained librarian to make the catalogue and to teach the use of it, as well as to stimulate the use of the books themselves, is needed to complete this picture. How many high schools of the country have established such libraries cannot be stated. The last Bureau of Education statistical report on libraries gives the number of school libraries in the country having over 1000 volumes as 1644, but private schools and the larger public school libraries are included.

In New York State there were in 1909 fifty-three high school libraries, established within the last twenty years, thirty of which are for the exclusive use of the schools, nine of them are for all grades, though housed in high school buildings, and fourteen of them combine the functions of high school and public libraries. Twenty-five of these libraries are in charge of librarians having previous library training or experience. A very important function of the high school librarian is that of giving instruction to the pupils in the use of the library, catalogue, indexes, and reference books. This is done systematically in several high schools in New York State, and the committee on high school libraries of the New York Library Association has been bringing the matter to the attention of high school principals. It has been done for some years in the Detroit Central High School; in other high schools, as at Newark, this instruction is given by the English teachers aided by the public library. In Cleveland the high school libraries are under the charge of the

public library. The schools furnish equipment and reference books, the library the librarian and a permanent circulating collection, and, in addition, lends books as needed, a regular delivery schedule being maintained between the high school libraries and the public library. Instruction in the use of books, based on a manual prepared by the supervisor of high school branches, is given regularly in all the high school libraries, for which credit is given in English.

Library Training in Normal Schools — Most school libraries depend for their efficiency on the teacher, who must not only acquire enough knowledge of library economy to arrange, care for, and record the use of the books, but who should be able to guide the reading of the children and also to make the books contribute their utmost toward the enrichment of the school work. In order to attain this end, normal school students must be trained in the care and use of books and given some critical knowledge of children's books.

In a report of a subcommittee of the National Council of the N. E. A. on the relation of libraries to normal schools, in 1899, the question was asked if "the professional training of teachers had not reached that period in its development where the library must be one of the chief factors in the training of pupil teachers?" No mention was made in the report of any definite course in library training being given by a normal school, but an affirmative response was made to the query shortly after by the announcement of library courses by normal schools in different parts of the country. In 1902 a trained librarian was engaged by the Cleveland Normal School to give a course in "library use." In 1903 a study of juvenile literature was added to it. The course occupies three periods a week for three terms, is on the same basis of credit as other regular courses, and is required for graduation.

The Normal School at Whitewater, Wis., publishes a helpful outline of the work given there. The N. E. A. published in the *Proceedings* for 1906, and as a separate pamphlet (now out of print), a report on the subject which outlined a rather elaborate scheme of library instruction.

In several cities, Omaha, Neb., Newark, N. J., and Dayton, Ohio, among them, instruction of normal school students in library work has been carried on by the public library.

A number of state normal schools have given courses in library economy in connection with their summer schools, and in Michigan instruction in library work has been given at teachers' institutes.

Branch Libraries in Schools. — The movement to increase and to socialize the use of school buildings is of great interest to librarians and suggests the desirability of placing branches of public libraries in school buildings, more generally than has been done heretofore. This has already been started in Newark, N. J., and it has been carried on successfully for several

years past in Grand Rapids, Mich., where through cooperation between the Board of Education and the library regular branches of the library have been housed in the school buildings. These are conducted as public, not as school libraries, being open from 12 30 to 9 P. M., and containing books for readers of all ages. The superintendent of schools said recently that the greatest educational advance in recent years was the establishment of branch libraries in the public schools, as the presence of a library and a librarian added greatly to the efficiency of the general school work.

Canada. — The district school library movement started in New York in 1835 and spread into Ontario, where an act was passed in 1850 providing for school libraries managed by local authorities under regulations prepared by the Council of Public Instruction. In accordance with the law, a classified catalogue was prepared by the Council from which alone selection could be made. The books were purchased by the Council, and, in addition, books to the value of the amount raised by the locality were given by the Council to each library. A record of each library was kept by the department and of the books furnished to it, thus preventing duplication. This law was much more enlightened than most of the corresponding legislation in the United States, and its results have been satisfactory.

England. — Sonnenschein's *Cyclopædia of Education*, 1906, states that in Great Britain any attempt at the formation of elementary and secondary school libraries has been due chiefly to purely voluntary effort, no assistance being given by the State. School libraries are not mentioned in the Educational Act of 1902. In an article in the *Library World* (1905-1906, p. 173) it is stated that about 9000 schools out of 12,000 are provided with libraries, the management of which varies in different localities. The larger number are entirely under the control of the individual education committees, while some are managed by a joint education and library committee. The public libraries of Great Britain have been too much hampered by restrictive legislation limiting the amount that could be raised by rates for library support to carry on work for schools like that done in the United States. A beginning, however, was made at Cardiff, Wales, in 1899. The school board raised the money, and the library committee undertook to administer the libraries, a joint committee of management being appointed from the two bodies. This has worked very successfully. The example has been followed by several other localities, and it indicates the line along which school libraries are likely to develop in the United Kingdom.

In London in 1908 a scheme was adopted by the County Council by which any public elementary school may be supplied with a small permanent library upon an application to the

libraries' committee by the headmaster or trustees, who must give surety to the Council for the safe custody of the books. A list of 200 books will be sent to the applicant with a recommendation that books be selected from it.

France. — The idea of placing libraries in the schools dates back to the era of the Revolution; the *Décret sur l'organisation des écoles primaires*, 12 Dec. 1792, directed that there should be formed in each school a small collection of books for the use of the pupils, and that it should be put in the care of an *Instituteur*. All the subsequent laws relative to elementary education recognized the importance of school libraries and dealt with means of introducing them into the schools. Successive ministries ordered the distribution of books to the schools, and between 1833 and 1848 more than a million volumes were distributed. But the indifference of the teachers and the laxity of supervision worked even more disastrously in France than in America, and in 1850 the school libraries had completely disappeared (Buisson's *Dictionnaire de Pédagogie*, s v *Bibliothèques*, 1911 ed.).

In 1862 the ministry issued an order directing the establishment of school libraries in every public school for boys, and ordering the books to be placed in a bookcase in a schoolroom under the care of an instructor. No commune would receive books from the government unless it complied with this regulation. The State has since continued its gifts of books to school libraries, the volumes comprising both works necessary to the classroom work and instructive reading for the scholars and for adult members of their families. A special commission was created in 1865 to pass upon the books to be bought for school libraries; this commission, *Le Comité des bibliothèques de l'enseignement primaire*, issues catalogues of approved books from time to time.

The development of school libraries has been continuous since 1862. There are now in the neighborhood of 50,000 libraries, containing an average of 160 volumes in each; the regulations are definite, and the libraries are a branch of the public service.

Germany. — There is no general school library law in Germany, and but little mention of school libraries in the educational legislation of the separate states. Württemberg and Saxony have recognized them, but the laws are vague and merely suggestive, and have not had much influence. So, while there are libraries in most of the higher schools and in many public schools, the school library has not the legal status in Germany that it has in France or Austria. The existing school libraries are in general for the use of teachers and pupils, and are not for popular use, as in France, though in country districts the public and school libraries are sometimes combined.

Austria. — The Minister of Religion and Education issued an order in 1870 that a library should be established in every communal

school; regulations for the organization of the libraries were promulgated in 1871 and completed in 1875. The director of the school is to be responsible for the library, which is not only intended for the scholars, but for the people of the commune. The government has not given the school library movement the systematic support which it has received in France, and there are no general statistics of the number of school libraries obtainable; but there has been much general interest in the subject, and private efforts have been organized to extend and improve school libraries.

School libraries for pupils and their families are also found in Sweden, Switzerland, and Belgium.

Italy. — The government has done nothing for school libraries, but at a library conference in Milan in 1906 it was reported that a national society had been organized with headquarters in Ferrara to promote the establishment of school libraries. Through the efforts of the society the schools of Ferrara and Leghorn had been provided with libraries, and the movement was extending to Pisa, Turin, San Remo, Florence, and elsewhere. The society is doing much, but it cannot take the place of state action, and until that is forthcoming Italy will be far behind its neighbors.

Spain. — School libraries were created in Spain by government decree in 1869. In 1878 the government purchased 100,000 volumes for distribution to school libraries, but it seemed to consider the work done for all time, as no provision was made for subsequent additions.

J. A. R.

Pedagogical Libraries — Pedagogical libraries in the United States have developed in connection with national, state, and city bureaus of education, state and city libraries, universities, and normal schools.

The U. S. Bureau of Education at Washington, D C., established in 1867, has collected a pedagogical library of more than 100,000 volumes. In certain classes of educational literature, such as state and city school reports, laws, etc., catalogues and reports of universities, colleges, and schools, files of educational periodicals, and transactions of educational associations, the library is probably the most complete in the country. It has also a large collection of school and college textbooks. While primarily a library for the use of the bureau staff, it is designed to serve also as a central reference and circulating library for educators throughout the country. Books may be borrowed as interlibrary loans, or upon the guarantee of a responsible school official, or of a personal deposit, and are transmitted to the borrower free of charge. The library also supplies bibliographical information on educational subjects through its printed publications and correspondence. Its most significant publications are the *Monthly Record of Current Educational Publications* (No. 1, Jan. 15, 1912),

accumulated in the annual *Bibliography of Education*, which now covers the period since 1907, and *A Teacher's Professional Library. Classified List of 100 titles.* (Washington, 1909.) Upon request the library also supplies lists of books and magazine articles on special educational questions. The bibliographical equipment of the library consists of a union catalogue of educational literature in the government libraries at Washington in card form, an extensive card index to the contents of current official reports, society publications, and periodicals relating to education, and a file of reference lists in typewritten manuscript form. (W. D. Johnston. The Library of the Bureau of Education. *Educational Review*, Vol. XXXVI, pp. 452-457, December, 1908. E. D. Greenman. The Bibliographic Work of the U. S. Bureau of Education. *Library Journal*, Vol. XXXVI, pp. 180-181, April, 1911.)

The state pedagogical libraries are identified with either the state department of education, the state library, or the state university. Those of the first class are ordinarily mere office libraries; but two significant exceptions may be noted, that of the New York Department of Instruction, established in 1895, the purpose of which was the circulation of professional and related literature among school officials and teachers throughout the state, and that of the Rhode Island Department of Education, which sought instead to promote the establishment of local collections and with this in view published a periodical *Library Bulletin* (1908).

The New York Education Department library was in 1904 transferred to the state library. In other states, too, the facilities of a general library for the care and distribution of books have led to the development of a pedagogical department of the state library and the circulation of traveling libraries for teachers either by the state library or state library commission. The state universities on the other hand have superior resources for the bibliographical work pertaining to such service.

In California (1889) and New Jersey (1891) county libraries for teachers were established. In each case, however, the tendency has been to merge this special service with the general, and especially to make use of the library resources and equipment of the largest county town.

The first city to establish a pedagogical library was Philadelphia. This library, founded in 1883 upon the accession of Dr. James MacAlister to the office of superintendent of schools, published a catalogue of its collections in 1887, and again in 1907 (525 pp.). This library still remains distinct from the public library service of the city; but in most other cities, as in most states, the special library service has either been transferred to the general library or in some measure made a part of it. In Cleveland, for example, the board of education published in 1892 *Courses of professional reading for teachers and catalogue of pedagogical and refer-*

ence books of the Free Public Library. In Providence, on the other hand, it was the public library which first published a catalogue of local collections of pedagogical literature, issuing first a list of books in its own collections (*Monthly Bulletin*, May, 1897), and a year later a catalogue of the public school library at the office of the superintendent of schools. The only other local bibliographical work of significance for teachers is that done by public libraries, examples of which are the *List of textbooks in the Boston Public Library*, *Monthly Bulletin*, September, 1900, and the *Check list of works relating to the schools and to the educational history of the city of New York in the New York Public Library*, published in its *Bulletin* for June, 1901.

Of university pedagogical libraries the earliest and the largest is that of Teachers College, Columbia University. This library, established in 1888, was in 1899 coordinated with the other libraries of the university, and in 1901 a catalogue entitled *Books on Education in the Libraries of Columbia University* (435 pp.) was published. The library now numbers 87,236 volumes and pamphlets, of which 65,336 relate to education. The latter are distributed as follows. history of education, including documents, 15,784; higher education, 21,807; secondary education, 5472; elementary education, 1104; training of teachers, 2734; textbooks, 6501; other classes, 11,336.

The libraries reported by 185 public normal schools in 1910 contained 1,331,705 volumes, an average of 7198 volumes each. The largest library, that of the Indiana state normal school, Terre Haute, contained 50,000 volumes. Fifty-seven private normal schools reported 189,823 volumes, an average of 3330 volumes each.

The principal pedagogical libraries in other countries are the *Pädagogische Central-Bibliothek (Comenius-Stiftung)*, Leipzig, 152,216 volumes and pamphlets (*Katalog der pädagogischen Central-Bibliothek*, 2te Aufl. 1892-1897, 2 v.); the library of the *Musée Pédagogique*, Paris, 76,000 volumes (Catalogue, 1886-1889, 3 v.); and the library of the English Board of Education (25,000 volumes). LIBRARY CLASSIFICATION OF EDUCATIONAL PUBLICATIONS

— The system of classification of books on education commonly used in public and in some university and college libraries is the Dewey Decimal System. This classification is as follows:

370 EDUCATION

- 1 Theory of education Meaning Aim
- .109 History of educational theory
- .15 Psychology applied to education
- .3 Dictionaries Cyclopedias
- .4 Essays Addresses
- .5 Periodicals
- .6 Organizations Conventions
- .7 Study of education Institutions and organizations for training teachers
- .71 Teachers' meetings
- .72 Teachers' institutes
- .73 Normal schools
- .74 Educational museums
- 9 History, description
- .92 Educational biography
- .93-99 History of education in special countries

371 TEACHERS' METHODS DISCIPLINE

- 1 Teachers Teaching personnel Professors, masters, instructors
- .11 Qualifications Personality
- .13 Examination Certificates Certified teachers Licenses
- .14 Appointment Organization of teaching force
- .15 Professional status
- .16 Salary and promotion Compensation Amount of service
- .161 Salary
- .165 Promotion Advance in rank
- .2 School organization School records
- .21 Admission Enrollment Matriculation
- .212 Grammar or intermediate school admission standards
- .213 High school standards
- .214 College standards

The Library of Congress has recently devised a scheme of classification which is now used by the Bureau of Education and other governmental departments, as well as in some other public libraries; and, because of the exchange of index cards inaugurated by the Library of Congress, is apt to be used in many additional libraries. This scheme alone occupies a pamphlet of 168 pages. The outline of this scheme is as follows:

- L- General
- 11-97 Periodicals, Societies
 - 101 Yearbooks
 - 106 Congresses
 - 111-791 Documents. Reports
 - 797-898 Exhibitions. Museums
 - 901-981 Directories
- LA5-LB15 Encyclopedias
- LA-History and description
- 11-13 General
 - 31 Ancient history
 - 96 Medieval history
 - 106 Renaissance period and early modern
 - 126 Modern history
 - 205 United States
 - 212 Primary or elementary education
 - 222 Secondary education
 - 226 Higher or university education
- LB- Theory of education
- Principles and practice of teaching
 - 1025 General
 - 1051 Educational psychology
 - 1115 Child study
 - 1137 Plays, games, etc.

LIBRARY CLASSIFICATION

LJ-College fraternities
LT-Text-books

The third system of library classification which has common usage in the United States is the Cutter Expansive classification. The outline of the educational section as follows:

IK	EDUCATION
KC	Classical education
KE	Home education
KF	Female education
KH	Early education in general, including infant education, kindergarten, and primary school
KI	Infant education; the mind of the infant
KM	Self-education
KP	Public education, Popular education, Compulsory education
KR	Religious education
KS	Scientific education
KT	Technical, Industrial education
L	Mechanic's institutes, Mercantile associations, Apprentices' associations, Lyceums, etc.
M	Reading clubs, Debating societies, etc.
N	Correspondence universities, Chautauqua societies, etc.
O	University extension
P	Pedagogics, Teaching
PC	Curriculum
PD	Discipline
PDC	Corporal punishment
PE	Examinations
PH	Hours of study, vacations, etc.
PI	Inspection
PM	Marking
PO	Organization
R	Means of Education
RB	Books, School
RD	Apparatus, School
RK	Laboratories, School
RL	Libraries, School
RM	Museums, School
S	Kindergartens, Object teaching
SK	Kitchen gardens, i.e. household training for children
T	Primary schools
U	Secondary schools, Public schools in general
V	Private schools
W	Academies, Gymnasias, Public schools like Eton, Rugby, etc.
X	Universities and Colleges
Y	Special schools, methods and history
IZA	Blind and deaf and dumb
ZB	Blind
ZC	Books for the Blind
ZD	Deaf and dumb
ZF	Feeble-minded
ZI	Indians
ZK	Criminals
ZN	Negroes, Freedmen
ZP	Poor, The
ZW	Women, Female education, Sex in education

Any one of these systems is subject to local modification, especially in case of large libraries. The third may be used in combination with the other two for more detailed analysis of any one class.

LIBRARY METHOD

LIBRARY METHOD.—In the teaching of geography, history, and other school subjects, where the final reliance of the ordinary student is placed upon books, it has become a well-established practice to supplement the class text with additional textbooks and other readings. Some teachers have gone further and required the student to do his reading in the school or public library under the normal conditions which would accompany similar work in after life. The student is trained to know the probable sources of information, to consult the proper bibliographies and guides to reading, to make his own list of references, to estimate the materials found, and finally to prepare his work in outline with reference in good form.

The library method represents an extreme reaction from the slavish use of a class text, distinctly in the right direction. The teacher who relies largely upon one or more texts is very likely not to give the student power to investigate and develop a subject under the difficulties which would confront him, once he is removed from teachers and school facilities. This is true in a slightly lessened degree where a large number of books are used as supplementary or collateral reading. Here the student knows a larger number of books to which he can make appeal, but he may not have acquired the ability to use a library. The library method bears somewhat the same relation to the modern humanities as the laboratory method does to the modern natural sciences; it makes the pupil familiar with the materials and methods which would be used in the more thoroughgoing field of research. There is distinct danger, however, that the method may be carried too far in teaching, particularly by teachers who are themselves engaged in research, and are instructing students whose present interest in the subject is general and cultural rather than specialized and investigative. The method is slow in accumulating facts for the student; it is a prolonged matter in which the young student may soon lose interest, if he does not actually take a dislike to a subject pursued by a method so costly of time and energy. Its most extended and complicated use will be found in college and university, but it ought to be somewhat used in its less complex forms in the secondary school, and perhaps even in the highest grades of the elementary school. Such a tendency exists. The growth in approval of the efforts to teach children the power of independent study is one of the broader pedagogical sanctions behind a modified application of the library method to teaching in grammar and high schools. LIBRARY SERVICE, TRAINING FOR.—

No formal means of training for librarianship existed in this country before 1887. The library school proper was hinted at as an ultimate desirability in the *Library Journal* of May, 1879. Interest in the subject of training was aroused in 1877 at the International Conference held in London, at which accounts were given of the Italian practice of admission to library service through examinations, and of the system employed at the Vittorio Emanuele library in Rome. The idea of library training has thus been borrowed from abroad, but its development in America has been along lines somewhat different to that in Europe.

It was not until 1886, however, that plans were made for a library school. In the meantime, certain libraries had acquired some reputation for training their apprentices, chiefly in cataloguing and classifying. But the general situation was chaotic. In 1886 announcement was made that a School of Library Economy would be opened at Columbia College, in its library on Madison Avenue and 49th Street, New York. No entrance examinations were given, and the class of nineteen or twenty students entering came from various parts of the country, some with experience in libraries, some without. The work consisted largely of lessons in cataloguing and classifying, other subjects being taught by lectures, without recitations; practical work was also arranged, but was optional at first. The first class began in January, 1887, and the course was finished in June. In 1889 the resignation of Melvil Dewey, the librarian of Columbia College, and his appointment as State Librarian, led to the removal of this school from New York to Albany, the title being changed to the New York State Library School.

In 1890 Pratt Institute of Brooklyn, N. Y., which had been carrying on a class for the benefit of its own staff, announced that this class would be open to applicants not on the library staff, and twenty-two persons undertook the course. Here also no examinations were given for the first year, and no tuition fee was charged. In the second year a small fee was required, and in 1892 entrance examinations were given. Very soon other than local candidates applied and the class became a school, supplying other libraries with assistants. In 1892 Drexel Institute, of Philadelphia, opened, with a library school among its departments, and in 1893 Armour Institute, in Chicago, tried the experiment. The two former schools are still in existence, but the last-named was removed in September, 1897, to the University of Illinois, Urbana, Ill., where it has remained. In 1897 Syracuse University offered a course in library economy; in 1904 a school was opened in connection with Western Reserve University, Cleveland; in 1905 instruction was offered by the Carnegie Library of Atlanta

and Winona Institute of Indianapolis, and in 1907 by the Wisconsin Library Commission. The Carnegie Library of Pittsburg established a course for children's librarians in 1900, and Simmons College, Boston, in October, 1902, made library science a subject to be studied in connection with the regular college course. The latest school, now in process of establishment, is that connected with the New York Public Library.

The character of each school is somewhat dependent on that of the institution with which it is connected. While the same subjects appear in the curricula of all, the emphasis on certain subjects is stronger in some schools than in others. The practice which can be offered to students in a college or university library is different in degree and even in kind from that offered in a public circulating library. As yet, however, this has not led to specialization in the schools as entirely as one would imagine. The only declared attempt at specialization is that of the school connected with the Carnegie Library of Pittsburg. The Wisconsin Commission's school trains primarily for Wisconsin libraries, and the school at Atlanta for the libraries of the South, but no school refuses to enlarge the field for its graduates, when opportunity offers. The likenesses and differences of these schools can be discovered only by an examination of their various hand-books. It is evident that no type school is yet fixed.

While there is a difference of opinion among the schools as to some of the entrance requirements, the majority have an age limit of twenty years, refusing all applicants under that age. Two schools, those connected with the New York State Library and Illinois University, now make college graduation an entrance requirement. Some institutions hold a supplementary examination in addition to requiring college graduation. Others, again, give their own entrance examination more nearly suitable to the work to be taken up; the subjects of examination cover history, literature, current events, general information, French, and German. Schools that began by accepting high school certificates and diplomas or freshman requirements have gradually raised their standards and made tests definitely applicable to the work to be undertaken. A comparison of entrance examinations shows that, while there is general uniformity in the subjects required and the passing mark is usually the same, the difficulty of the examination and its value as a test vary with different schools. Examinations are very generally exchanged among the schools, and while there is not much copying, it is admitted that the practice has suggestive value. Uniformity in entrance examinations is favorably considered.

In the curricula of the schools stress was laid originally, not by intention, but of necessity, on those branches of work best exemplified

LIBRARY SERVICE

in college libraries, — cataloguing, classification, reference work, and the subjects coming under the head of technical library economy. The schools have modified this preference to some extent, although the first three subjects are still the backbone of every course. The introduction into even the small libraries of the Library of Congress catalogue card has made the importance of cataloguing consist largely in the study of subject headings rather than in the writing of the catalogue card as formerly, while the modifications insisted upon by libraries using the best-known systems of classification have led to a more searching interest in classification itself rather than to the memorizing of any system. As the field of work for libraries has enlarged, the study of library extension in its various forms has become a part of the curriculum of most of the schools.

The subjects of instruction may be classed under four heads: administrative, technical, bibliographic, literary, the two first claiming more attention than the others in the present allotment of hours. The following synopsis represents the general classification under these heads: —

Administrative. — Library buildings — legislation — government — reports — rules, blanks, and forms — accounts — staff — furniture and fittings — principles of work with children, and with other classes of users.
Technical. — Classification — cataloguing — work of order department — accession work — alphabetizing — shelf-listing — book numbers — mechanical preparation of books for the shelves — stock-taking — loan systems — keeping of statistics — care of supplies — preparation for binding.

Bibliographic. — Trade bibliography — general and subject bibliography — public documents — book selection — reference work — history of printing — history of binding — history of libraries.

Literary. — Appraisal of fiction — appraisal of current periodicals — modern European literature — study of children's books — technical French — technical German — technical Italian.

Miscellaneous. — Indexing — proofreading — type-writing (optional in most schools) — current topics — survey of library field — library extension.

A specific amount of actual practice in one or more libraries is required by all library schools, this differing in value, both as a test of the student and as a help to the student, according to the kind of library, the amount, variety, and character of practice available, the amount and quality of supervision given, and the fullness of reports made of the students' work.

At the end of one year the schools giving a general course of this duration, offer a certificate to the satisfactory student, the schools of two or more years usually withholding the highest recognition until the completion of the course, when a diploma or the degree of B. L. S. is bestowed upon the graduate.

Within the last ten years the demands made upon the library schools have increased in number and complexity. Specialization in libraries has begun and so taken hold of the imagination of those in commercial and manu-

LIBRARY SERVICE

facturing concerns that the largest of them are organizing or reorganizing libraries and calling for trained or experienced librarians to manage them. The schools cannot give specific training for such work, and can supply only graduates with a technical library training and general education, whereas, to make the most of such libraries, a scientific specialist is needed. Professional libraries, those of medical, law, and theological institutions, and libraries of applied science, are in the same case. The schools are called upon for a highly differentiated product, and do not have it to offer, while having plenty of demand for all that they do offer. In other words, more training, and that specialized, is needed. Another defect exists in the small number of librarians instructed in bibliographical matters. Many are interested, but, owing to the lack of old and rare books and manuscripts in American libraries, to the essentially practical American temperament, and to the lack of any instruction or opportunity for instruction, few American librarians are sufficiently versed in or sufficiently appreciative of the cultural side of their work. It is still necessary, in the largest libraries, for those having collections of rare and early books or old manuscripts, to call upon the foreigner of university education and scholastic aptitudes to deal with this material.

The interest in the two fields of special libraries and of bibliography has led within the last few years to the formation of the Special Libraries Association and of the Bibliographical Society of America, and increasing pressure has since been brought to bear upon the library schools to extend their curricula in these directions.

The immense and rapid increase of libraries, the extension of the library field to cover the work of State Library Commissions, libraries in schools, grade, high, and normal, rural and county libraries, libraries in state institutions, and the sudden rise of municipal and state legislative reference libraries, and commercial and technological libraries, call for a well-considered and far-sighted scheme of training beyond anything that is now offered.

The question of remuneration entered into the question of training very early. Numerous librarians of small libraries, who were without special schooling in their work and could not afford to attend the library schools, either became uneasy in regard to their tenure or ambitious to be prepared for better work or better positions, and a demand arose for short and inexpensive summer courses which could be pursued within the limits of an obtainable vacation or leave of absence.

For the most part, such courses have been conducted by State Library Commissions which have aimed at the raising of the professional level and not the lowering of it by short cuts to positions; they have had to face the fact that it was almost impossible to get

LIBRARY SERVICE

librarians of longer training at the salaries offered, and have therefore tried to inspire the attendants on the short courses with sufficient interest to come back for several successive years until they acquire the equivalent of a year's general course.

In the same way the large city libraries, feeling unable to pay to the lowest grades of assistants the salaries required by graduates of the schools, have opened apprentice classes for training subordinate members of their staffs. Entrance to these classes is usually by examination, and after from six to nine months of instruction, combined with practice, the apprentice is eligible to a paid position. In some libraries promotion also is gained through examinations, and the qualified apprentice may reach a much better position. The only objection to these classes, from the point of view of disinterested care for librarianship, arises from the youth of the average apprentice, who has not had time for the study and reading desirable in persons engaged in an educational work and who is not likely to get time when once engaged in strenuous daily practice; from the occasional laxness of those who pass upon admissions, in regard to the personality of candidates; and from the reprehensible practice — not generally followed, however — of giving a general letter of recommendation to apprentices who cannot be given employment, thus enabling them to enter the field of general library work when their training has been in the methods of one library only.

The work for which the training class of the large library system prepares is so specific a work that its problems are less complex than those of the library schools; but as yet it has failed, with exceptions, to attract the most desirable local material, owing partly to the low salaries offered and partly to the fact that an adequate effort has not been made to set the work before persons desirable as applicants with the attractions that it undoubtedly has in itself and with an appeal to the civic spirit that exists in many young people. M. W. P.

LIGHTING OF SCHOOLHOUSES — It is now generally established that with proper orientation and unhindered sky exposure there should be in every schoolroom from one quarter to one sixth as much glass surface as floor space, e. g. from 128 to 192 square feet of glazing in a room 32 feet long and 24 feet wide. This standard has been adopted in most progressive countries. Variation must, however, be provided for according to circumstances; less window space will, for example, be required where there is a long period of intense sunshine than where long foggy days of winter or even the shadow of neighboring buildings must be guarded against. Where the standard proportions are adopted, it is also necessary that the windows are properly placed and have the best orientation. This is a matter to be handled by the architect, who must make the best use of the wall space at his disposal, safeguard the external appearance of the building, and observe the hygienic laws affecting the eye. In rooms designed for primary classes the windows should be at least 3 feet 6 inches from the floor, and for all upper grades, including high schools, they should be set 4 feet above the floor. In all cases care should be taken that the windows should be higher than the eyes of the pupils when seated at their desks, and so prevent the strong light from striking the retinae. The light needed is that reflected into the eye from the page of the book or work upon which the pupil is engaged. A strong light from the wrong direction will tend to

maladjustment of the eyes, to strain of unhygienic vision, and fatigue of the ciliary muscles. (See EYE) In addition to saving the eye, the necessity of placing the windows $3\frac{1}{2}$ or 4 feet from the floor and maintaining a definitely proportioned area leads to an extension of the windows nearer to the ceiling, and one foot of glass surface near the ceiling of a schoolroom is worth more than two feet at the bottom of a low window, especially in the rooms on the ground floor, and allows the light to be more thoroughly diffused. The upper part of a window properly exposed to the light carries it farther across the room and lets it fall more directly on the work on which the pupils are engaged. The introduction of iron and steel beams in the construction of buildings permits of the extension of windows to within six inches of the ceiling without any danger to the building. The top of the glass surface ought to be at least twelve feet above the floor, allowing eight feet at least as the length of each window, without the slightest detriment to the external appearance of the building.

Unilateral Lighting — Windows of a schoolroom should be placed on one side only. Where there are windows on opposite sides of a room, there can be but one line through the room along which the light will be equally strong from both sides, a line, however, which shifts because of the change in relative light due to the changing position of the sun and other less important factors. As a result pupils will suffer the annoyance of crosslights and be subject to direct rays of light continually. Another defect is the introduction of wedges of shadow from the walls between the windows, while the amount of window space uses up this available room for blackboards. Unilateral lighting always from the left side is the only efficient type for a schoolroom. The windows should be placed as far to the rear of the room as possible, with the mullions as narrow as possible, so as not to obstruct the light and take up space in the wall. Thus a solid or blind wall of ten feet should be left in front of the windows. No objection can be raised to this arrangement, since, as was stated above, the only effective light in a schoolroom is that reflected from the work with which the pupils are occupied, and the pupils' desks are rarely nearer the teacher's end of the room than eight feet. The position of windows here described concentrates the light and delivers it on the desks of the pupils.

Windows should never be placed facing the pupils; where they are still found they should be covered with opaque curtains so fastened to the sash that no beams of light can come through. Nor should there be windows in the rear of a room for purposes of light. Where, as in the south, they are desirable for ventilation, they should be placed about eight feet from the floor up to the level of the other

windows, with which they should harmonize in size. They should be hinged on the lower side and fastened above with a spring catch. Stained glass or an opaque shade may be used with these windows, for the light should be excluded for the benefit of the teacher. If any attempt is made at decoration, a design of leaded glass will be found most successful; but the main purpose of these windows is to allow ventilation, and accordingly they should be made to open and close easily, and set so as to prevent rains from beating in.

Width of Mullions — The mullions, it has just been stated, should be narrow. To this objection has been made that they would not afford adequate support, a valid objection in the case of two-story buildings or buildings of brick or stone construction only. A metal mullion has, however, been devised which solves this problem. This form of mullion has been used with success under many conditions. Where walls are not of necessity thick and heavy, part of the weight may be supported from above by using a steel lintel in addition to the narrow mullion. The use of the arch form of lintel which transfers the strain to a greater or less degree to the main walls in front and behind the windows is not to be recommended, because it encroaches on the window surface on both sides. The steel lintel has been used in many of the largest and most successful school buildings in New York City.

The mullion should be wedge-shaped with the edge turned outward, so that a wider gathering of light is made possible by reason of its beveled form, and much of the shadow otherwise cast by the mullion is eliminated.

Orientation — In the latitude of this country it is essential for purposes of lighting to open as many windows as possible toward the east or west. The east light is the best, the south is most trying and troublesome, the west is good, and the north should be used only for rooms designed for art work in its various forms. The advantage of the east light is that a room may be directly purified by the sunlight almost before school work begins, while for the rest of the day a clear white light from the eastern sky can be obtained without the glare of the direct rays of the sun. With light coming from the south it is almost impossible to keep out the direct sunshine and at the same time get indirect and diffused light into the room. Whatever means may be used, streaks of light will filter through the room and tax the accommodative muscles of the eyes. Where the noonday heat is strong, as in the south, it will be difficult to keep out the heat, and at the same time not to darken the room too much, if ventilation depends on the windows. To cut out direct sunshine and at the same time permit the air to pass unhindered is a matter of some difficulty. Venetian blinds have been recommended, but have certain defects: they are noisy, cut out the

best light, are rarely adjusted to meet the exact demands and conditions, and, when rolled up, often admit pencils of light, and easily get out of order. Sliding blinds are, if anything, even less desirable. The difficulty of providing successful blinds as screens from the sun has not yet been overcome.

For the primary grades schoolrooms receiving light from the west are often more satisfactory in hot climates than those receiving light from the east, for the day's sessions of these classes is usually over before direct sunlight streams into the room. But for the upper grades lighting from the west is less desirable, since the rooms are apt in summer to become uncomfortably warm after two o'clock.

As few rooms as possible should have windows placed on the north side unless they are to be used for art work, or possibly as manual training rooms and laboratories. It is a safe rule, then, to have as many classrooms as possible facing the east or west and to utilize the space on the south for libraries, offices, physical and biological laboratories, and that on the north for drawing, manual training, and chemical laboratories. This statement will sufficiently indicate the importance of considering the lighting of schoolrooms at the time of selecting a site for the building. (See ARCHITECTURE, SCHOOL.) Sufficient has been said to show that in this country it is best that a schoolhouse should be built with its main axis running from north to south in order that the classrooms, as far as possible, may be supplied with light from the east and west. While a school building facing at an angle of 45° with the meridian would receive sufficient sunning and light in almost every room, there are disadvantages connected with the plan which make it inadvisable; thus with the main axis of the building from northeast to southwest those rooms looking toward the southeast would be troubled by the long exposure to the direct rays of the sun, giving rise to difficulties already referred to, and with the axis from southeast to northwest the rooms facing to the southwest would be affected in the afternoon both by direct sunlight and heat.

Ribbed Glass.—The problem of lighting rooms too wide for the height of windows, or those situated where sufficient window surface could not be obtained, or those too close to tall buildings, or neighboring trees, has been greatly simplified in recent years by the use of ribbed or prismatic glass. It has been used most extensively in business houses, such as stores, where deep rooms must get all their light from a restricted frontage. It is not expensive, and when set high up in a window increases and diffuses the light in a very helpful way. It is generally not advisable to set such glass in the lower part of windows of schoolrooms, on account of the glare thus produced. But for basements, dark hallways, toilet rooms, and closets it is specially valuable.

For regular classrooms it is most satisfactory when placed in the upper half of the windows. There are now many dark and gloomy schoolrooms in daily use, which could be easily transformed into well lighted, cheerful rooms by the use of ribbed glass, which is comparatively inexpensive to substitute for the ordinary glass.

Artificial Lighting.—Because of this situation of the country with reference to latitude, comparatively few public schools have heretofore needed artificial lighting during the day session. But as evening schools multiply, and as school buildings come to be used more and more for various social and educational undertakings, it is rapidly becoming necessary to give this phase of school equipment more consideration. It is highly advisable, therefore, that all plans for high schools, manual training schools, and all other school buildings likely to need either power or light, should have provisions for electric wiring and such fixtures as are necessary for immediate use. In general it is good economy to thoroughly wire all school buildings, where the probability is on the side of future need for it, especially since this is not an expensive undertaking. For the same reasons gas pipes ought to be installed; for progress is rapid nowadays, and good schoolhouses ought to last a hundred years or more. It goes without saying that electric lighting is much to be preferred to gas, even though the new methods of handling gas flames insure good light. Electric lights give out but little heat, and release no bad odor or noxious gases. They reduce the danger from fires, are far more easily and quickly lighted, require less attention, and offer no dangers from leakage, or contamination of any sort. This cannot be said of gas lights under the most favorable methods yet devised. Clay gives the following table, prepared by Professor Lewes, which shows the "Comparative Hygienic Effect of Illumination per Unit of Light."

	CARBONIC ACID EVOLVED	MOISTURE EVOLVED	OXYGEN REMOVED FROM AIR	HEAT PRODUCED
Acetylene	100	100	100	100
Coal gas, flat flame	480	1170	520	795
Coal gas, mantle	45	230	62	87
Petroleum, large lamp	995	700	498	216

(See FELIX CLAY, *Modern School Buildings*, London, 1902, p. 118.)

But electric lights are hard on the eyes, particularly when the filaments are visible. It is necessary, therefore, to shield the eyes from these by ground glass bulbs, or some form of refractive and dispersing globes surrounding the bulbs. The chief objection to the ground glass bulb is that it permits only about 50 per cent of the light to pass through.

As the result of some extended experiments for the Schoolhouse Commission of Boston, it was found that for direct lighting "the most satisfactory results were obtained from nine thirty-six candle power forty-watt Tungsten lamps, each equipped with the diffusing prismatic reflector. These shades are constructed of prismatic glass coated on the outer or inner surface with a white enamel."

Various forms of holophanes have been used, and the best of these give good light dispersion and at the same time shield the eyes from the glare of the globes. The chief point, however, for consideration in preparing plans for wiring schoolrooms, assembly halls, and other rooms of like sort, is to see that the wires are properly placed and that switches are conveniently arranged both for power and lights.

In villages and country districts not yet supplied with electric lighting currents, the acetylene lighting has proved very helpful. This gas, which is made by bringing calcium carbide into contact with water, gives a brilliant white light and burns quite regularly. It is not expensive to install such plants, and where a comparatively cheap and a very effective gas illuminant is needed, this form is to be recommended. It has, however, the disadvantages and dangers of all such illuminants.

LILLE, UNIVERSITY OF. — Although established as a university only as recently as 1896, this institution directly succeeded the old university at Douai which had been founded by Papal Bull in 1560 and sanctioned by Philip II of Spain in 1562. There were five faculties: of theology, civil law, canon law, medicine, and arts. The university was intended to stem the rise of Protestantism in the Low Countries. The continuity of organization and work was not broken by the change of the rulers of Flanders in the reign of Louis XVI. A decline set in during the eighteenth century, and in 1793 the university was closed by Napoleon, and in the reorganization of 1806 only the faculty of letters was restored, to be closed again from 1826 until 1854. At the latter date a faculty of medicine was added, and in 1865 a faculty of law. In 1875 a faculty of medicine and pharmacy was established at Lille, whither the other faculties were transferred in 1887. In 1890 the four faculties were recognized as a university. The enrollment of students in 1910 was 1675 (law, 567; medicine, 368; pharmacy, 109; science, 335; letters, 296). For the present organization see FRANCE, EDUCATION IN.

LILY, WILLIAM (1468–1522) — The writer of the authorized Latin grammar which for many generations was to England what for a thousand years Donatus (*q.v.*) was to Europe

Lily was born at Odiham, near Southampton, c. 1468, and was educated at Magdalen College, Oxford, where Grocyn (*q.v.*) lectured on theology. Lily intended to enter the priesthood, and took a pilgrimage to Jerusalem; but became converted from the priesthood of ecclesiasticism to the ministry of learning, and entered with enthusiasm into the study of Greek. At Rome he studied under Sulpitius and Pomponius Laetus Sabinus, so as to make himself a thorough Latinist. When Lily returned to London, he was ranked, with Grocyn and Linacre (*qq.v.*), among the earliest of English Renaissance Grecians and Latinists. About 1512 Lily was appointed headmaster of Colet's foundation of St. Paul's School, London, an office which he held till his death in 1522. Lily's fame as a schoolmaster is eclipsed by his authoritative *Latin Grammar*. For an account of this see LATIN LANGUAGE.

LIMEN — This term has been introduced into recent psychological discussions as a substitute for the earlier term "threshold," which was employed to indicate that degree of a sensation which is just perceptible. Thus, when one begins with a very faint air vibration which is not perceptible to the ear and gradually increases its intensity, he ultimately reaches the threshold or limen of the sensation or the point at which a sound is just audible. There are also limens of difference, that is, after a sound has reached a certain intensity, if it is gradually changed so as to become more or less intense, the point is reached at which the difference in intensity is just noticeable. Sound serves as a good example, but all forms of sensory experience exhibit limen values in analogous fashion.

LIMITS. — A topic necessarily met in an elementary way in the study of plane geometry, and one that forms the subject of scientific study in the calculus, in the theory of irrational numbers, and elsewhere in more advanced mathematics. The term is difficult of simple definition, but is easily illustrated. For example, the length of a circle is, and may be defined as, the limit of the inscribed or circumscribed regular polygon of n sides, as n increases indefinitely. Similarly, the limit of the sum

of the series $1, \frac{1}{2}, \frac{1}{3}, \dots$, can easily be shown to be 2. The following definition has been suggested by Professor J W Young as one that is as simple as can reasonably be expected: "Let C be any linearly ordered class, and let the variable x represent any element of this class. A segment of such a class may be defined as the elements of the class which lie between two given elements of the class. Given an element a , which need not be itself an element of the class C, but which is ordered with reference to C (it may be an element of a linearly ordered class C' containing C), a neighborhood or vicinity of a is defined as any segment of the class C such that a lies between two elements of this segment. The element a is then said to be a limit element of the class C, provided every neighborhood of a contains elements of C."

The practical question for the teacher of high school mathematics is this: where should the subject be introduced, and how extensively should it be treated?

In reply, it seems at present to be the feeling of the great majority of teachers in the United States that no scientific treatment of limits should be attempted in the high school. Incommensurable quantities (qv) are now not generally recommended for pupils of this grade, and practically the only need for the idea of limit is found in the treatment of the circle and the round solids. For this treatment nothing is required beyond the idea of limit, a strict definition like the one given above not being necessary. Theorems relating to limits are usually postponed until the calculus is reached, when the needs of the subject and the maturity of the student demand and permit their introduction. D E S.

LINACRE, THOMAS (1460?–1524). — Humanist physician; received his early education at Canterbury, probably at the school of the monastery of Christ Church, under William de Selling, who had visited Italy. Linacre then went to Oxford, and in 1484 was elected Fellow of All Souls. About 1485–1486 Linacre went with Selling to Italy, and at Florence was under the instruction of Politian and Demetrius Chalcondylas. He met Hermolaus Barbarus at Rome, and Aldus the printer at Venice. At Padua he stayed long enough to graduate as Doctor of Medicine. It is clear that he must have remained several years in Italy. He had already begun a translation of the book on the *Sphere* of Proclus from Greek into Latin, and this was completed or revised in England, and published by Aldus at Venice in 1499, being the first work of the Renaissance influence done by an Englishman. Linacre settled at Oxford, and was incorporated M.D. and lectured, probably, on medicine, though he taught pupils Greek, e.g. Sir Thomas More (*q.v.*). In 1501 he was tutor to King Henry VIII's son Arthur, and removed to London;

and in 1523, together with J. L. Vives (*q.v.*), was Latin tutor and physician to the Princess Mary, for whom he wrote an elementary Latin Grammar — the *Rudimenta Grammatices* (date not known). Many editions of the *Rudimenta* also contain Vives' *De Ratione Puerili*, suggestions for systematic reading and composition. Linacre received a number of ecclesiastical appointments, though he probably did no work in them. In 1518 he founded the College of Physicians, which in the first instance held its meetings in his house in Knightbridge Street, London. He also bestowed great benefactions on the University of Oxford.

In 1517 he turned his Greek studies to use for the purposes of his profession of medicine, and translated from Greek into Latin the first six books of Galen's *De Sanitate Tuenda*. (See GALEN.) In 1519 this was followed by a similar translation of Galen's *Methodus Medendi*, a great undertaking. In 1521 he translated Galen's *De Temperamentis*, a work of the first importance in its historical influence, one of the bases of the psychology of medieval and Renaissance times. With regard to these translations from classical medical writers, Dr. J. F. Payne remarks that, in spite of drawbacks, the revival of classical medicine led "immediately to the revival of anatomy, of botany, and of classical medicine as progressive sciences, and produced results quite comparable to those ascribed to the Renaissance in other departments of knowledge." Other medical translations into Latin from the Greek of Galen made by Linacre are of less importance. In 1524 he published his *De Emendata Structura Latini Sermonis*. This work was apparently written at the request of Colet to be used in St. Paul's School, but was found too comprehensive and regarded as unsuitable for the capacities of boys. Colet adopted a brief grammar (*Æditio Coleti*) drawn up by himself and Lily (*q.v.*). This incident caused a quarrel between Linacre and Colet, which Erasmus unsuccessfully tried to settle. The *De Emendata Structura* is not an ordinary grammatical accidence, but an account of Linacre's ingatherings in the way of illustration from all sources placed under the headings of the parts of speech. The significance of the work is that it is the application of the inductive method to philological and grammatical purposes, and shows a command over authors and a power of purposeful multitudinous citation, in both Latin and Greek, which was entirely new to England in 1524. In the second part of the book Linacre enters upon construction in composition, and expounds the use, with examples, of figures of speech. The last section is entirely given to Greek constructions, and the book, therefore, marks the first published Greek study in England. F. W.

LINCOLN, ALMIRA. — See PHELPS, ALMIRA LINCOLN.

LINCOLN COLLEGE, LINCOLN, ILL. — A coeducational institution chartered in 1865. In 1901 the charter was amended, making the college a constituent member of the James Milliken University (*q.v.*). Preparatory, collegiate, normal, music, and elocution departments are maintained. The college confers the degree of A.B., B.S., and Ph.B., on completion of the appropriate courses. The degrees of A.M. and M.S. are given after one year of graduate work, of which one semester must be in residence. The faculty consists of seventeen members.

LINCOLN MEMORIAL UNIVERSITY, CUMBERLAND GAP, TENN. — A coeducational institution founded in 1897 to provide higher education for the people of the mountains. Preparatory courses and domestic science, commercial, music, elocution, art, printing, industrial, agricultural, normal and collegiate departments are maintained. Courses leading to the degrees of A.B., B.S., and Mus. B. are offered. There is a faculty of twenty-eight members. The enrollment of students in 1911-1912 was 301. The Lincoln Memorial Hospital and the Lincoln Memorial Medical College, both of Knoxville, are affiliated.

LINCOLN UNIVERSITY, CHESTER CO., PA. — An institution for the higher education of the negro race, chartered in 1854 as Ashmun Institute, the present title being adopted in 1866. Collegiate and theological departments are maintained; the former is undenominational, the latter is under the control of the Presbyterian Church. The requirements for entrance to the college are fifteen units of high school work. An arts course is offered, leading to the A.B. degree. In the theological department students are admitted to the regular course if they have already pursued a college arts course or its equivalent. The degree of S.T.B. is granted. The enrollment of students in 1911-1912 was 134 in the college and forty-three in the theological seminary. The faculty consists of thirteen members.

LINDNER, GUSTAV ADOLF (1828-1887). — An Austrian educator; was born at Rozdalowitz in Bohemia and studied at the University of Prague. In 1854 he became a teacher at the gymnasium of Cilli in Styria, where he wrote

LINE OF REGARD

his *Lehrbuch der Psychologie für Mittelsschulen*. (*Textbook of Psychology for Secondary Schools*, 1858.) This book, as well as his *Logic*, which soon followed, is still largely used in Austrian schools. In 1871 he was appointed director of the Realgymnasium at Prachattz in Bohemia, and soon afterwards put in charge of the Czech teachers' seminary at Kuttenberg. In this position he published two textbooks on general methodology and general pedagogy, as well as his *Enzyklopädisches Handbuch der Erziehungskunde* (see *ENCYCLOPEDIAS OF EDUCATION*). He was also the editor of a series of pedagogic classics, for which he translated the *Didactica Magna* of Comenius. In 1878, when the University of Prague was split into two institutions, a German and a Czech, he was called as professor of philosophy and pedagogy to the Czech university, where he taught until his death.

Lindner was largely instrumental in introducing the Herbartian psychology and pedagogy into Austrian schools. Besides the books spoken of above, he published a number of philosophical and pedagogic writings, among which may be mentioned; *Introduction to the Study of Philosophy*, 1866, *The Problem of Happiness*, 1868, and *Contributions to Social Psychology (Ideen zur Psychologie der Gesellschaft als Grundlage der Sozialwissenschaft, 1871)*. LINDSLEY, PHILIP (1786-1855). — University president; graduated from Princeton in 1804. For three years he taught in the schools of New Jersey. He was tutor and professor at Princeton from 1807 to 1824, and president of the University of Nashville from 1824 to 1850. He was active in the work of the early American educational associations, and published numerous articles on educational subjects. He was one of the early advocates of normal schools for the training of teachers. W. S. M.

LINE FORMATION IN SCHOOL ROOM.

— See SCHOOL MANAGEMENT.

LINE OF REGARD. — A single point to which both eyes are directed is called the *fixation point* or the *point of regard*. The *line of regard*, is, then, an imaginary line passing from the center of rotation of the eyeball to the point of regard. The two lines of regard, in any act of binocular fixation, thus form an angle at the point of regard. The term *plane of regard* is applied to the plane passing through both lines of regard. Both the concepts *line* and *plane* of regard are used in describing or calculating the possible movements of the eye.

LING, PER HENRIK (1776-1839) — The founder of the Swedish or Ling system of gymnastics; was born in Småland, one of the southern provinces of Sweden, Nov. 15, 1776. He was educated in the higher classical school at Wexio, where he distinguished himself by his "mental ability, strong individuality, firm, unyielding will, and reckless enterprise." He was dismissed from the school, with others of his comrades, in November, 1792, for some breach of school discipline. Not much is known regarding his life in the next six years, except that he was a student at Lund and Upsala universities, where he studied theology and modern languages. From 1799 to 1804 he studied philology at the University of Copenhagen, and engaged in literary work. He wrote in French, German, and Danish, translated the poem *Balder's Death* by Johannes Evald into Swedish, and wrote in Danish a three-act comedy, *The Envious Man*.

During the years of his stay in Copenhagen, Ling frequented a fencing school conducted by two Frenchmen, and there acquired great skill in the art of fencing. He also attended a private *Turnanstalt* conducted by Nachteggall, where he took up gymnastics with great enthusiasm. In 1804 Ling was appointed fencing master at the University of Lund. Besides fencing, Ling also taught riding and vaulting. He remained at Lund until 1812, when he was appointed teacher of gymnastics at the Royal Academy in Karlberg near Stockholm. Soon after taking up his work at Karlberg, he conceived the idea of founding in Stockholm a royal Central Institute for the training of teachers of gymnastics. The Institute was opened in 1814, with Ling as its director, and is still in existence. Ling taught gymnastics at Karlberg until 1825, and he retained the post of director of the Royal Central Institute from its foundation in 1814 until his death in 1839. In 1835 he was elected to membership in the Swedish Academy, and was given the honorary title of Professor and the decoration of the Order of the North Star by King Charles XIV.

Ling believed that gymnastics had a rightful place in education, medicine, and national defense. He had studied anatomy and physiology at the University of Lund, and tried to base his system and teachings upon rational and scientific foundations. He did not leave any complete treatise of his system of gymnastics. His chief works are: *The General Principles of Gymnastics*, published in 1840 by his pupils, Liedbeck and Georgii; *Regulations for Gymnastics to be Used in the Army*, published in 1836; and *Instructions in Gymnastics and Bayonet Exercises for Soldiers*, published in 1838.

LITERARY CENSORSHIP — Early Period.

— The practice of supervising, restricting, or prohibiting the expression of intellectual conceptions or the dissemination of ideas is as old as the organization of society itself. Some one holding authority or claiming authority was always ready to object to the free circulation of ideas as threatening danger to existing institutions, religious or political. The two earliest authorities recognized by men, that of the ruler, whether of the family, the clan, or the State, and that of the priest, the representative of the accepted religion, were equally interested in retaining control over the direction and the expression of thought. In the earlier communities, political and religious authority were frequently combined in the same individual. It is probable that in these states the contention for an authoritative control of opinion rested chiefly upon the risk that heretical utterances might interfere with the public peace.

The earliest method of publication was in the form of the lecture or recital. A censorship or control of the utterances of the lecturer could be exercised by the very simple method of prohibiting the lecture, and, in case of contumacy, of imprisoning or killing the lecturer. The decision of the authorities at Athens in 400 B.C. that Socrates must be put to death, is often referred to as possibly the earliest recorded example of censorship by the State. It is certain that no organized official censorship ever came into existence in Greece. The philosophers and the poets appear to have lectured and written without hindrance and without supervision.

An early example of the influence of the Christian Church for the restriction or elimination of objectionable literature is described in Acts xix, 19: "Many of them also which used curious arts brought their books together and burned them before all men." This was frequently cited in later centuries by upholders of the censorship policy of the Church of Rome. Certain of the more artistically printed editions of the *Index* (for instance, the first Roman edition of the *Index* of 1758) contain, as a vignette title, a representation of Paul casting into the flames the books of magic, and beneath the print the verse from Acts.

The whole theory of church authority and of excommunication for disregard of such authority was a matter of slow development through the ages that followed the preaching of St. Paul. It was, in fact, not until the sixteenth century that there came into existence anything that could be called a censorship policy or any attempt at a general censorship system; but from the earliest periods in the history of the Church, there are instances of condemnations of individual writers, and of prohibitions, under severe penalties, of the manifolding or of the distribution of particular works. These prohibitions are usually the result of one of the series of fierce controversies about dogma that characterized the earlier centuries of the Church. They emanate for the most part from councils, but they are occasionally issued directly by the Pope or by local bishops. In certain cases, they take the form of an imperial edict; but even in these the initiative comes from a council. It is probable that the influence either of the councils or of the Emperor in restricting the multiplication or distribution of writings that had been condemned was not very effective. The edicts and decrees must be considered as representing an expression of opinion connected with some one of the bitter theological controversies of the day, rather than as regulations to be enforced. There was, in fact, no machinery for the enforcement. The work of the copying scribes could not be supervised, as was possible later for the operations of the printers, and the manuscripts could be passed from hand to hand among the sectarians without the intervention of a bookshop.

Roman Empire — There are instances of literary censorship on the part of the imperial authorities of Rome before the institution of the Christian Church. Thus Tacitus remarks that Augustus was the first ruler who undertook to punish a word written or spoken, that is to say, a word unaccompanied by action. The law of the Roman Republic had recognized as deserving of punishment only criminal deeds, but the Emperor brought the authority of the law to bear upon writings described as libellous or scandalous (*libelli famosi*). He ordered, for instance, that the writings of Labienus should be publicly burned. His successor Tiberius issued a still stronger regulation for the supervision of undisciplined or insubordinate writings. Cremutius Cordus was driven from his occupation and left to die through poverty for the offense of speaking of Gaius Cassius as the "last Roman." His writings were ordered to be burned by the *ædile*. Tacitus speaks with scorn of those who, in the possession of a little momentary power, undertake to crush out opinions not in accord with their owner to prevent such opinions from being handed down to posterity. The writings of Verjinto were prohibited by Nero. Concerning this prohibition, Tacitus

writes: "So long as the possession of these writings was attended by danger, they were eagerly sought and read; when there was no longer any difficulty in securing them, they fell into oblivion." This statement of literary conditions under the early Empire shows a curious resemblance to the results which obtained throughout Europe fourteen centuries later. The books which were formally condemned and the titles of which were placed on the *Index* obtained an advertisement which secured for them a decided advantage over works of the same general character that had not been fortunate enough to be picked out for reprobation. An edict ascribed to Domitian ordered that the historian Hermogenes and any book dealers who assisted in the distribution of certain writings of his which had libeled the Emperor should be crucified. Severus and certain other bishops Justinian deposed from office, because they had been lax in their supervision of literature and had permitted the wide circulation throughout the realm of prohibited books and of pernicious writings.

Catholic Church — With the development of the Church of Rome to the ecclesiastical headship of the civilized world, the claim for the supervision of literature and for the control of the productions of authors was asserted by the Church as the legitimate successor of the imperial authority. The earliest and most sweeping censorship of the Christian Church is probably that contained in the Apostolic *Constitutions*, which purport to have been written by St. Clement of Rome at the dictation of the Apostles. These *Constitutions* prefigure the *Index* by forbidding the Christians to read any books of the Gentiles: "The Scriptures should suffice for the believer" (*Const. Apost. Lib. I, CVIII*). This general prohibition of St. Clement (which bore date about 95 A.D.) is followed by a series of prohibitions issued by the authorities of the early Church, mainly under the decision of the councils. For instance, in 150, a synod of bishops of Asia Minor, meeting at Ephesus, prohibited the *Acta Pauli*, an historical romance written a little earlier in the century, and having for its purpose the clarification of the life and labors of St. Paul.

In 325 edicts were issued by the Emperor Constantine and prohibitions by the Council of Nicæa, against the writings of Arius and of Porphyry. The Emperor ordered the penalty of death for any who might conceal copies. In 399 the Emperor Arcadius issued an edict, based upon the recommendation of a council of the Church, ordering the destruction, under penalty of death, of all books of magic art. The various denunciations of books of magic art were, under the influence of the ecclesiastics who might happen to be in control of the proceedings of the councils, utilized for the repression of the writings of their theological

opponents. In 399 the Council of Alexandria, presided over by Bishop Theophilus, issued a decree forbidding the owning or the reading of the books of Origen (*q.v.*). The Egyptian monks protested, and the bishops were obliged to call in the prefects to enforce the authority of its edicts. In 436 the Emperor Theodosius issued an edict forbidding the possession and the reading of the books of the Manichæans and ordering the burning of the same. In 416 Pope Leo I issued an edict ordering the destruction of a long series of writings described as not in accord with the teachings of the synods of Nicæa, and, therefore, antagonistic to the Christian religion. The prohibition prescribes that: "Whoever owns or reads these books is to suffer extreme punishment." In 499 Pope Gelasius issued what is later referred to as the first papal *Index*. It presents a catalogue of books prohibited, but the prohibitions have to do not with private or general, but with public or official reading. In 496 Gelasius issued a decree, confirmed later by the Emperor Gratian, which specified the patristic writings accepted and approved by the Church, and which then proceeded to the condemnation of a long series of apocryphal and heretical writings and writers. The classification of the writings to be condemned is curiously general in terms (*Hæc et omnia his similia*, etc.).

These condemnations are presented as early examples of the basis of authority for the restriction of reading. The restrictions emanated for the most part from the councils, and were promulgated by the popes, while their enforcement depended upon the exercise of imperial authority. The Church and the State worked in unison for the control of expression of opinion. The orthodox opinion was that which was supported by the majority of the latest council and which secured the approval of the Pope. A year or two later the majority might be changed and the Pope replaced by an ecclesiastic representing a different school of thought. There is no record of any individual opinion on the part of the Emperor. His edicts were issued and his actions were taken under the counsel of the ecclesiastics and for the safety of the State.

From the ninth to the fifteenth centuries a long series of condemnations and prohibitions of books were ordered by various ecclesiastical authorities, councils, bishops, and popes. These prohibitions present examples of the attempts made, in advance of any system of general indexes, to supervise, control, and restrict the production and distribution of literature. The penalties placed upon the writers of books classed as heretical cover excommunication, imprisonment (sometimes for life), and, not infrequently, death. The penalties upon those who continue, after the issue of the prohibition, to distribute or to read the heretical writings cover excommunication and occasionally imprisonment. In

869 Gottschalk, a German monk, at the instance of Hinemar, Archbishop of Rheims, was excommunicated and condemned to imprisonment for life; he died after twenty years' confinement. His offense was the publication of a treatise opposing certain doctrines of St. Augustine. The conclusions arrived at by Gottschalk were, curiously enough, substantially in accord with those maintained seven centuries later by successive popes and by the "orthodox" Church generally, against the "heresies" of Jansen and Quesnel.

During the period here in question, 830-1430, it did not prove possible to secure any consistency of action on the part of the ecclesiastics undertaking to represent the authority of the Church. The changing personalities of the successive popes, the average of whose reigns was less than five years, and the varying points of view of synods and bishops, speaking from all parts of Europe, produced a series of utterances in regard to heresy which naturally enough were frequently conflicting and which might have caused serious difficulties to conscientious believers who were endeavoring in good faith to maintain for their teachings and their studies a consistently orthodox standard.

In 1215 the Fourth Synod of the Lateran condemned a tractate written by the Abbot Joachim against Peter Lombard. The *Sentences* of Lombard had been accepted by the Church as presenting the best compact statement of the views of the orthodox Church, and the book was utilized for instruction in the several university centers. The Lateran decree reads: "Any one who shall attempt to defend the heretical utterances of the said Joachim concerning the Trinity shall be thrust out as an heretic."

In 1225 the Synod at Sens condemned the treatise by Scotus Eriugena (*q.v.*) written about 860, *De Divisione Naturæ*. Pope Honorius confirmed this condemnation, and ordered that all persons possessing copies of the books must, under penalty of excommunication, deliver the same within fifteen days to the ecclesiastical authorities for burning. Scotus had, during the first century at least after his writing, been accepted as an orthodox son of the Church, but his teachings gave rise later to many controversies. In 1231 Pope Gregory IX wrote to the University of Paris directing the prohibition of the *Libri naturales* of Aristotle, which had already been condemned by the Provincial Council, until they had been freed from heresies. During the greater part of the Middle Ages, the views of Aristotle had been accepted by the Church as in accord with orthodox teachings; and as his writings made their way into Europe they were generally accepted for instruction in Montpellier, Paris, and elsewhere.

From time to time, however, some ground for protest is found on the part either of a council or a pope. One of the teachers whose

influence was most potent during the middle of the thirteenth century against the heresies that were disturbing university circles was the great schoolman, Thomas Aquinas (*q.v.*). He is credited with having turned the tide of skepticism in Paris. The Minorite scholar, Petrus Johannes Oliva, who died early in the fourteenth century, is an example of an author whose writings gave occasion for conflicting decisions on the part of the highest authorities. In 1312 John XXII condemned these writings and ordered them to be destroyed; and the bones of Oliva were disinterred and were burned with copies of his books. In 1471 Sixtus IV, himself a Minorite, after further examination of the writings of Oliva, declared them to be sound in doctrine and removed the prohibition. A similar result obtained in the case of Raymond Lully, who died in 1315. In 1378 Gregory XI condemned two hundred propositions selected from Lully's treatises. In 1559 Lully's name was placed in Class II of the Roman *Index*; but in 1564 the Council of Trent decided that the condemnation was unwarranted, and freed Lully's books from prohibition.

In 1387 King Richard II of England prohibited, under penalty of imprisonment and of confiscation of property, the sale or purchase of the heretical writings of Wyclif, who had died three years earlier. This is the first instance in England, and is certainly one of the earliest in Europe, of a condemnation by royal or by political authority, which does not even in form rest upon a decision of the Church. In 1408 the Convocation of Canterbury prohibited the reading of any writings of Wyclif or any writings of the associates of Wyclif until the same had been expurgated by censors appointed by the universities of Oxford and Cambridge. In 1415 the Council of Constance condemned as heretical the writings of Wyclif. In the same year the Council took similar action in regard to the writings of John Hus, copies of which were publicly burned, and in the year following the same fate came upon Hus himself.

In 1463 Pope Pius II, Æneas Sylvius, condemned, in a Bull directed to the University of Cologne, a tractate on the Council of Basel which had been written by himself before his elevation to the papacy. He says further to the university: "In case you may find among writings of mine any that are unsound or are likely to prove pernicious, these should be analyzed and condemned." To a friend who chafed him in regard to the correction of his own views, the Pope said very simply: "As we climb higher, we are able to see more clearly."

The great impetus given to the distribution of books by the invention of the printing press (1450) had as one result a fresh effort at supervision and control of literary production on the part of the Church. The first measures that were put into shape for the enforcement of

such control provided for what has been called preventive censorship; that is, for a requirement, before the printed book could be put into circulation, of an examination and approval by ecclesiastical authorities. It was, however, not until half a century after Gutenberg had printed his first book that official cognizance was taken of the new art in a Papal Bull. And it was nearly half a century later before the Church undertook, through a system of expurgatory and prohibitory indexes, to maintain a systematic censorship upon literature. The invention of printing had as an immediate result an enormous increase in the influence upon the shaping of popular opinion of the written word, which now became the printed word, that is, of thought in the form of literature.

It was not until nearly three fourths of a century after Gutenberg, when the leaders of the Reformation were utilizing the printing presses of Wittenberg for the spread of the Protestant heresies, that the ecclesiastics became aroused to the perils that the new art was bringing upon the true faith and upon the authority of the Church. If the people were to be protected against the insidious influence of the new heresies, it was essential that some system should be instituted under which the productions of the printing press could be supervised and controlled. The more active and far-reaching the operations of the printers, the greater the necessity for the watchful supervision of their work, and the greater at the same time the difficulty in making such supervision complete and effective. The requirement was met by mandates which prohibited any books from reaching the public that had not been passed upon and approved by ecclesiastical examiners appointed for the purpose. The production and the circulation of any literature not so approved was stamped as constituting a misdemeanor of the most serious character, one that might become the final sin against the light, the offense against the Holy Ghost.

In 1559 the responsibility for the censorship of literature was assumed directly by the papal authority through the publication of the *Index Auctorum et Librorum Prohibitorum* of Paul IV, the first of a long series of papal *Indexes*, aggregating, up to 1900, forty-two in all. No *Index* has been published since that of Leo XIII, in 1900, although a number of books have been condemned by separate prohibitions. It does not appear to have been the intention either of Paul or of his successors that the responsibility for the system of censorship should be retained under the exclusive direction of the papal authorities, and there is no record of objections having been raised to the publication of *Indexes* prepared by such representatives of the Church as the theological faculties of the universities of Louvain and of Paris or by the Inquisition

of Spain. There were, however, very material differences between the lists as shaped in Rome of works condemned as heretical and the similar lists issued within the same period in Louvain, Paris, or Valladolid. Books of undoubted heresy included in one *Index* failed to find place in another, and it is not possible to arrive at any consistently applied principle or policy by which the selections of the chief compilers were determined. It might at first be assumed from the wording of the prohibitions that any and all of the *Indexes* published under the direction of ecclesiastical authorities such as those specified must have been intended to be equally binding on all the faithful irrespective of political or ecclesiastical boundaries. In the majority of cases, however, no attempt was made to enforce the prohibitions of an *Index* outside of the territory of the state in which it had been promulgated. It is probable that the Roman *Indexes* were held to be in force outside of the immediate territory of the Church only after they had been formally accepted and promulgated by the authorities ecclesiastical and political of the individual states, such as Spain, France, the Empire, etc. The first of the series of papal *Indexes* was, as stated, issued under Paul IV in 1559, but as early as 1542 the Inquisition of Rome had promulgated a special edict prescribing penalties for the reading of heretical or doubtful books, and in 1545 was published the first Italian list of prohibited books and authors. This is one year earlier than the date of the *Index* of Louvain of 1546, which is usually referred to as constituting the first of the series of official *Indexes* of the Church. In 1571 the task of compiling the papal *Index* was confided by Pius V to a body organized under the name of the *Congregation of the Index*, which is still (1912) carrying on its work. These Roman *Indexes* exercised an important influence, even in the states in which the papal prohibitions were not officially published, as the titles collected for them were largely utilized by the makers of the *Indexes* of Spain, France, and Belgium; and in like manner the material put into print in Louvain, Paris, and Valladolid formed the basis of certain of the Roman lists. A more authoritative position in regard to the work of censorship was taken by the Papacy through the publication, in 1564, of the *Index* of Trent. This *Index*, as well through its formulation of the rules for censorship as because of the greater comprehensiveness of its lists, constituted the most authoritative guide that had yet been issued. The *Tridentine Index* was promulgated under the authority of the council and successive popes throughout all the Catholic states and also in countries in which the Catholic Church, while no longer the ruling power, still possessed followers. It was printed in a long series of editions issued from all the more important publishing centers; its lists formed the basis of all subsequent

Indexes, while its famous ten rules were accepted as the guide for future censors and compilers. After the Council of Trent, a wider and more assured recognition was given by churchmen throughout the Catholic world, from which most curiously enough be excepted Catholic Spain, to the authority of the Papacy acting through the *Congregation of the Index*, to retain the general direction and control of the business of censorship.

In 1758, two centuries after the publication of the *Tridentine Index*, was issued the *Index* of Benedict XIV, in which the lists represented better bibliographical work than had been previously attempted. This *Index* is important as representing what may be called the last attempt of the Papacy to maintain any general censorship of the world's literature. The compilers of the *Index* since 1758, including that of Leo XIII, compiled in 1899 and published in 1900, content themselves with repeating the general rules or principles by which should be guided the reading of the faithful; the lists of current publications are, with a few noteworthy exceptions, limited to works of Catholic writers and chiefly to books of a doctrinal character, the teachings of which are to be found in one respect or another open to condemnation. The proportion of books absolutely prohibited becomes smaller, the greater number of the works cited being placed in the lists of *Libros expurgandos*, the reading of which is forbidden only until certain corrections or eliminations have been made (*donec corrigatur*). The *Index* of 1884 and that of 1900 bring forward from the more important of the preceding papal *Indexes* the titles of the most noteworthy of the works condemned in these. No attempt is made, however, to condemn, excepting under general rules and principles, the increasing lists of modern Protestant doctrinal books or to characterize or differentiate the great mass of the world's literature. The printing press had outgrown the machinery of ecclesiastical censorship.

The interference during the earlier centuries of printing on the part of political rulers was fitful and intermittent, and appears at no time to have arrived at the dignity of a continued policy or system. In a number of states, as in Spain, France, and the Holy Roman Empire, while the rulers continued to claim for themselves the exclusive control of the printing press, they were willing to confide to the ecclesiastics the selections of the books to be condemned and prohibited. The Catholic work of censorship, at least in the countries which remained Catholic, fell, therefore, more and more into the hands of the Church, and was as a result carried on with reference to the clerical standard of orthodoxy and morality and to the clerical theories of what was required for the welfare of the community.

The proportion of works of a purely political

character that came under condemnation was small as compared with the long lists of books condemned on doctrinal grounds. During the two centuries in which censorship exerted the largest influence upon intellectual development, say from 1550 to 1750, the minds of men were directed more largely to doctrinal questions than to political matters. It was not the State, but the Church, whose authority and existence were assailed, and the contest was fought out not over political platforms, but over creeds.

When, with the beginning of the Reformation, it became apparent how great a range of influence was possessed by the printed sheet, the problem that confronted the authorities of the Church was certainly serious in more ways than one. For the space of fifteen centuries the education of the people had remained almost exclusively under the direction of the Church. The faithful had accepted their entire intellectual sustenance at the hands of the priests. In 1516 the leaders of the Reformation, in beginning their long contest against the Church of Rome, promptly availed themselves of the power of the printing press. While the words spoken in the pulpit or in the market place could reach at best but a few hundred of hearers, the tracts poured forth from the Wittenberg presses, the "flying leaves" (*Flugschriften*), carried to many thousands the teachings of Luther and Melancthon, and it was through these "winged words" (*epea pteroenta*) that the revolt developed into a revolution.

To the devout adherents of the Church of Rome, and particularly to those to whom had been given the responsibility for its government and for the spiritual guidance of its members, the situation, not only during these earlier years of fierce strife against the Protestant heresies, but throughout the succeeding centuries, presented the gravest difficulties. There is something pathetic in the long series of attempts made by the popes, councils, bishops, congregations, and inquisitors, to protect the souls of the faithful against the baneful influence of the ever-increasing tide of literature that was pouring forth from the various publication centers, and so much of which was calculated to lead men astray from the true doctrines and to bring them into risk of everlasting perdition. To ecclesiastical rulers honestly holding such a conviction there was of course but one duty. They must use every means in their power to suppress the heresies and to warn and protect their flocks. The action of the Church was, therefore, not only logical and reasonable; it was the only course that was possible for an organization to which, as its rulers believed, the Almighty had confided the care of the spiritual welfare of mankind. The safety of the soul depended upon the nature of the intellectual sustenance, whether this were taken through the ears or through the eyes. All literature

or instruction in any form, spoken, written, or printed, must, therefore, before reaching the understanding, be sifted under the authority of an all-wise and infallible Church. The believer must be protected against harm, the doubter must be recalled to the true path, and the heresies and the heretics must alike be exterminated. While it was only after the active propaganda work of the Reformers had made clear the perils of the printing press that any general system of censorship was attempted, there had been, as pointed out, instances of prohibited books centuries before the time of Gutenberg.

From 1450 on was issued a long series of papal utterances, given mainly in the form of bulls, in which is asserted the claim of the Church to the supervision and control of all literary productions before these are permitted to be distributed. The first of these papal bulls, dealing generally with the control of literature, bears date 1487. It was addressed by Pope Innocent VIII to seven "governments," as follows: Romana, Curia, Italia, Germania, Francia, Hispania Anglia, and Scotia. The opening paragraph reads: "And, therefore, we who hold on earth the place of Him who came down from heaven to enlighten the minds of men and to disperse the darkness of error, etc."

In 1520, on June 12th, Pope Leo X ordered a formal burning in Rome of the copies within reach of the writings of Luther, and with these was burned an effigy of Luther himself. This was four years after the appearance of Luther at the Diet of Worms.

The Bull *Cane Domini*, the Bull of the Lord's Supper, originally issued by Urban V in 1365, was reissued by successive popes, with some modification of its provisions, at different dates up to 1586. It presents a collection of various excommunications which had been ordered by successive popes against certain specific classes of persons. The form in use through the period of the Reformation was given by Julius II in 1511. Julius specified as under excommunication a number of heretical sects including the Wycliffites or Hussites. The conclusions of the Casuists in regard to the effect of the prohibitions in the Bull *Cane* are summarized as follows by Ferraris, *Libri Prohibition*. (n 27): In order that the reading of a book shall bring upon the delinquent the threatened excommunication: (1st) the book must be the production of an actual heretic, not merely of one not baptised, or of a Catholic who through heedlessness or ignorance has given utterance to heresy; (2d) it must contain a heresy, or must have to do with religious matters; (3d) the reader must have knowledge that the book is the work of a heretic and contains heresy or treats of religion; (4th) the reading must have been done without the permission of the Apostolic Chair. (5th) the reading must

of Spain. There were, however, very material differences between the lists as shaped in Rome of works condemned as heretical and the similar lists issued within the same period in Louvain, Paris, or Valladolid. Books of undoubted heresy included in one *Index* failed to find place in another, and it is not possible to arrive at any consistently applied principle or policy by which the selections of the chief compilers were determined. It might at first be assumed from the wording of the prohibitions that any and all of the *Indexes* published under the direction of ecclesiastical authorities such as those specified must have been intended to be equally binding on all the faithful irrespective of political or ecclesiastical boundaries. In the majority of cases, however, no attempt was made to enforce the prohibitions of an *Index* outside of the territory of the state in which it had been promulgated. It is probable that the Roman *Indexes* were held to be in force outside of the immediate territory of the Church only after they had been formally accepted and promulgated by the authorities ecclesiastical and political of the individual states, such as Spain, France, the Empire, etc. The first of the series of papal *Indexes* was, as stated, issued under Paul IV in 1559; but as early as 1542 the Inquisition of Rome had promulgated a special edict prescribing penalties for the reading of heretical or doubtful books, and in 1545 was published the first Italian list of prohibited books and authors. This is one year earlier than the date of the *Index* of Louvain of 1546, which is usually referred to as constituting the first of the series of official *Indexes* of the Church. In 1571 the task of compiling the papal *Index* was confided by Pius V to a body organized under the name of the *Congregation of the Index*, which is still (1912) carrying on its work. These Roman *Indexes* exercised an important influence, even in the states in which the papal prohibitions were not officially published, as the titles collected for them were largely utilized by the makers of the *Indexes* of Spain, France, and Belgium; and in like manner the material put into print in Louvain, Paris, and Valladolid formed the basis of certain of the Roman lists. A more authoritative position in regard to the work of censorship was taken by the Papacy through the publication, in 1564, of the *Index* of Trent. This *Index*, as well through its formulation of the rules for censorship as because of the greater comprehensiveness of its lists, constituted the most authoritative guide that had yet been issued. The *Tridentine Index* was promulgated under the authority of the council and successive popes throughout all the Catholic states and also in countries in which the Catholic Church, while no longer the ruling power, still possessed followers. It was printed in a long series of editions issued from all the more important publishing centers; its lists formed the basis of all subsequent

Indexes, while its famous ten rules were accepted as the guide for future censors and compilers. To the devout adherents of the Church of Rome, and particularly to those to whom had been given the responsibility for its government and for the spiritual guidance of its members, the situation, not only during these earlier years of fierce strife against the Protestant heresies, but throughout the succeeding centuries, presented the gravest difficulties. There is something pathetic in the long series of attempts made by the popes, councils, bishops, congregations, and inquisitors, to protect the souls of the faithful against the baneful influence of the ever-increasing tide of literature that was pouring forth from the various publication centers, and so much of which was calculated to lead men astray from the true doctrines and to bring them into risk of everlasting perdition. To ecclesiastical rulers honestly holding such a conviction there was of course but one duty. They must use every means in their power to suppress the heresies and to warn and protect their flocks. The action of the Church was, therefore, not only logical and reasonable; it was the only course that was possible for an organization to which, as its rulers believed, the Almighty had confided the care of the spiritual welfare of mankind. The safety of the soul depended upon the nature of the intellectual sustenance, whether this were taken through the ears or through the eyes. All literature

or instruction in any form, spoken, written, or printed, must, therefore, before reaching the understanding, be sifted under the authority of an all-wise and infallible Church. The believer must be protected against harm, the doubter must be recalled to the true path, and the heresies and the heretics must alike be exterminated. While it was only after the active propaganda work of the Reformers had made clear the perils of the printing press that any general system of censorship was attempted, there had been, as pointed out, instances of prohibited books centuries before the time of Gutenberg.

From 1450 on was issued a long series of papal utterances, given mainly in the form of bulls, in which is asserted the claim of the Church to the supervision and control of all literary productions before these are permitted to be distributed. The first of these papal bulls, dealing generally with the control of literature, bears date 1487. It was addressed by Pope Innocent VIII to seven "governments," as follows: Romana, Curia, Italia, Germania, Francia, Hispania Anglia, and Scotia. The opening paragraph reads: "And, therefore, we who hold on earth the place of Him who came down from heaven to enlighten the minds of men and to disperse the darkness of error, etc."

In 1520, on June 12th, Pope Leo X ordered a formal burning in Rome of the copies within reach of the writings of Luther; and with these was burned an effigy of Luther himself. This was four years after the appearance of Luther at the Diet of Worms.

The Bull *Cane Domini*, the Bull of the Lord's Supper, originally issued by Urban V in 1365, was reissued by successive popes, with some modification of its provisions, at different dates up to 1586. It presents a collection of various excommunications which had been ordered by successive popes against certain specific classes of persons. The form in use through the period of the Reformation was given by Julius II in 1511. Julius specified as under excommunication a number of heretical sects including the Wycliffites or Hussites. The conclusions of the Casuists in regard to the effect of the prohibitions in the *Bulla Cane* are summarized as follows by Ferraris, *Libri Prohibition*. (n 27): In order that the reading of a book shall bring upon the delinquent the threatened excommunication: (1st) the book must be the production of an actual heretic, not merely of one not baptised, or of a Catholic who through heedlessness or ignorance has given utterance to heresy; (2d) it must contain a heresy, or must have to do with religious matters; (3d) the reader must have knowledge that the book is the work of a heretic and contains heresy or treats of religion; (4th) the reading must have been done without the permission of the Apostolic Chair. (5th) the reading must

be sufficient in amount to constitute a mortal sin. This amount has naturally been variously defined, so as to cover the entire work (Sanchez), or a single page, or two lines (Tolotus). (Gretser, *De Jure Prohibendi, Opera XIII*, 97).

The year 1542 is important in the history of the censorship of literature. It marks the beginning of formal regulations framed in Rome itself for the suppression of heretical literature and for the supervision and control of the work of the printers. The Inquisition of Spain, which proved to be by far the most persistent, the most effective, and the most terrible of the Inquisition organizations of the world, dates from 1480. The series of *Indexes*, prohibitory or expurgatory, had its beginning, not in Rome, but in Louvain. The first general catalogue of prohibited books was printed in Louvain in 1510. The first schedule of prohibited books printed under the name of an *Index* was, as far as is at present known, that issued by the University of Paris in 1544. The first *Index* compiled in Italy was that in Venice in 1543. The first *Index* issued under the authority of a papal Bull was compiled in 1546 by the Theological Faculty of the University of Louvain under the instructions of the Emperor Charles V. From this period on there follows a long series of *Indexes* issued by the Popes or other ecclesiastical authorities or by Catholic princes in different parts of Europe. The first *Index Expurgatorius* was issued at Valladolid in 1534 by authority of the Senate of the Inquisition. In this certain books were marked as condemned until they had been expurgated, and the compilers of the *Index* themselves prepared editions of a number of these books. According to Paulo Sarpi of Venice, famous as leader in the long contest of Venice against the ecclesiastical authority of Rome, "the Roman authorities prohibit as corrupt the text of many valuable works, particularly of the class that have to do with political science and the rights of states; they prohibit many books which have no relation to matters of theology or religion, and which they are not in fact competent to understand; they contest the right of the Republic (Venice) to prohibit pernicious books." Thus an *Index* issued at Rome under Alexander VII formally condemned the works of Copernicus and Galileo (*qq v.*) and all other writings which confirmed the movement of the earth and the stability of the sun.

By the middle of the eighteenth century the Church authorities were finally prepared to admit the impracticability with any such means or examining bodies as could be maintained of making an individual examination of each work produced from the printing press. Such a conclusion might with better wisdom have been arrived at a century earlier. The most direct evidence of the futility of the attempts on the part of the *Congregation of the Index*, of the Roman Inquisition, and of the local

inquisitors, to inform themselves intelligently concerning the nature, the orthodoxy, and the probable influence for good or for bad of the increasing mass of books brought into print from year to year, is presented by the *Indexes* themselves. The work of the compilation of these *Indexes* was placed in the hands of scholarly men, and in the majority of cases of men whose integrity of purpose and whose devotion to the higher interests of the Church need not be questioned. These devout and scholarly compilers were, however, willing to put into print under the authority of an infallible Church, instructions for the reading of believers which the most faithful of Catholics must have found difficulty in obeying with any consistency.

The *Index* lists contain many inaccuracies. The names of the authors, frequently misspelled, are entered almost at random, sometimes in the vernacular, sometimes in the Latin forms. This method, or lack of method, necessarily resulted in duplicate entries, while the copyists succeeded not infrequently in omitting altogether in their transcripts writers and books of unquestioned heresy. It became increasingly impossible for the compilers to secure personal knowledge of the contents of more than a very small proportion of the books which were to be passed upon and classed as either safe or pernicious. The judgment arrived at concerning an unfamiliar book depended in part on the name of the author and in part on that of the printer or the place of publication. Certain printing offices and certain publishing centers came to be associated in the minds of the Roman censors with heretical opinions. The general policy seems to have been that it was safer to condemn a few books not assuredly either pernicious or heretical than to run the risk of omitting from the lists any single work which might constitute an influence against the authority of the Church. The selections were also undoubtedly influenced by doctrinal issues and by the party prejudices that arose between the great orders of the Church. The direction of the censorship work in Rome both of the Inquisition and of the *Congregation* has, since their institution, remained in the hands of the Dominicans though occasionally, under the authority of a Jesuit or a Franciscan, the two latter orders secured representation on the boards of examiners.

France. — In France, censorship was retained under the direct control of the Crown to an extent paralleled in no country except England. The prohibitions of the papal *Indexes* were not accepted as binding unless confirmed by the rulers of the Gallic Church, and the French bishops seldom took action in regard to censorship, excepting under instructions emanating from the Crown. The kings of France, during the two centuries succeeding the invention of printing, were for

the most part more keenly interested in furthering the operations of the printer-publishers than in protecting the doctrines of the Church and the faith of believers against the risks of heretical literature. The achievements of the Paris press brought prestige to the rulers. Even in the cases, however, in which a book might have been placed on the *Index* in Paris, it was likely to be promptly brought into print in Lyons or in Tours. If the authority of the censors succeeded in stopping the operations of provincial printers, the presses of Geneva, Cologne, and Amsterdam were ready to supply the demand that was certain to continue for a work classed as heretical or dangerous.

The law at present in force in France controlling literary censorship dates from the institution of the Republic in 1871. The wording of the law is quite voluminous. It provides, in substance, that there must be no publication containing incitement against public order, or anything offensive concerning the President of the Republic, and no publication, either in language or in pictures, of false news or of material to be classed as obscene. There must also be no publication which reflects upon the honor of any citizen, or is likely to cause moral damage to citizens.

The provisions of the law, however, are at this time (1912) very rarely enforced, except in the case of virulent attacks on the President, or on a foreign ruler or diplomatic agent. Such attacks have led to the suppression of a book, or of a particular number of a journal. Anti-military propaganda or incitements to disobey the military law have also led to the suppression of pamphlets or of specific numbers of journals. Action is, however, very rarely taken on the ground of obscenity or of personal defamation of character.

Netherlands. — In the Low Countries, and particularly in Holland, the operations of the censors and *Index* makers of Italy, Spain, and France constituted a factor of not a little importance in furthering the development of the book trade. The printer-publishers of Holland kept themselves promptly informed of the operations of the censorship authorities. Early copies of the *Indexes* found their way, as soon as produced, to Leyden, Amsterdam, and Utrecht, and were promptly utilized by the enterprising Dutch publishers as guides for their publishing undertakings. Within a few months of the time when the censors of Rome or Madrid had completed as they supposed, the cancellation of the local editions of the condemned books, copies of the Holland issues would begin to find their way more or less surreptitiously into the hands of the readers of the country of origin. The printer-publishers of Holland were also fortunate during the two centuries in which censorship was active in having available the services of scholars who had been banished from Spain

or Italy or France, or who had migrated for the purpose of securing freedom of action.

During these centuries, there was for Europe but one literary language, Latin. The Holland publishers were able, with the service of these scholarly exiles, to produce, at a comparatively low cost, for the use of scholarly readers throughout Europe, original works or great compilations which could not be undertaken by publishers in the states in which censorship was either persistently or even fitfully active. These Holland publishers were shrewd enough to utilize the censors of Rome, of Madrid, and of Paris as their literary advisers. They could bring into print with certainty of a remunerative circulation books which were important enough to have secured condemnation by the authorities of the *Index*.

It may be concluded, therefore, that outside of Spain the attempts of the Church to supervise and control the production and distribution of literature were practically without effect. It is doubtless the case that the circulation and the influence of many books were materially furthered by the stamp of ecclesiastical condemnation.

Protestant Censorship. — Irrespective of the censorship initiated by the divines, which had for its purpose the maintenance of creeds and the protection of "sound theology," history gives record of a long series of attempts, which have in fact continued into the twentieth century, to enforce what might be called political censorship, — that is to say, the control of literary production in the interests of the State and in support of the authority of the State, against opinions believed to be inimical to such authority.

The prohibitions to be classed as Protestant, whether in their origin ecclesiastical or political, do not compare favorably with the similar prohibitions issued under the authority of the Church of Rome. There is far less consistency of purpose, and, at least as far as the political edicts are concerned, there are more examples of bitter and brutal oppression than can be found anywhere in the states controlled by the Roman Church, outside of Spain. The list of books, which during the centuries in question came into condemnation under Protestant censorship, was more considerable than the aggregate of all the lists in the *Indexes* issued under the authority of the Roman Church. The censorship policy of the Protestants represented more largely the spirit of faction or personal grievance, while the political censorship was of necessity influenced by the action of the party which happened at the time to be in control or of the minister who had for the moment the ear of the ruler. Protestant censorship may be considered as less defensible than that of the Church of Rome, but as also less serious in its final effect upon intellectual activities.

It is not practicable under the conditions

obtaining in modern states and with the active intercourse between the residents of such states to repress any literary productions for which a circle of readers are waiting. The books condemned and prohibited in Berlin come into print in Leipzig; or, when imperial authority controlled conditions in Leipzig, such books were without difficulty purchased in Amsterdam or Leyden. It proved to be impossible to prevent books so printed from finding their way even into the territory in which their production and distribution had been absolutely forbidden.

England. — Censorship in England was controlled, as in France, by the authority of the Crown, and varied of necessity according to the policies of the successive monarchs. The regulations for the control of heretical publications were presented in a series of royal edicts. After the time of Luther, certain regulations were issued under the sole authority of the bishops, but these could be enforced only when confirmed by the political authorities. The Crown secured the control of the operations of the English printers by restricting very closely the licenses or permits for the use of printing presses. For the first century after the introduction of printing, very little printing was done outside of London. It did not prove practicable, however, to prevent the distribution through England of books of interest to English readers which were printed in Holland. At the time when political censorship in England was most severe, the printers in Holland secured the largest returns from the book market in England. The press law passed in 1819 imposed a penalty of transportation on the writers and printers of "godless and revolutionary works." This law was repealed in 1837, and the legislation of 1869 finally secured an assured freedom for the press.

The most eloquent argument ever presented in behalf of the freedom of the press was that published in 1644 by John Milton under the title of *Areopagitica*. Milton was protesting against the claim of Parliament to control the output of the printing presses and to decide what utterances should be permitted to the citizens of the day. He writes: "We should be wary what persecution we raise against the living labours of publick men, how we spill that seasoned life of Man preserved and stored up in Bookes . . . for Bookes are not absolutely dead things, but doe contain in them a potencie of life to be as active as that Soule was whose progeny they are, nay, they do preserve as in a violl the purest officacie and extraction of that living intellect that breed them."

Blackstone wrote that "Christianity is part of the laws of England. Offenses against it are punishable by fine, imprisonment, or other infamous corporal punishment."

In 1776, at the time of the publication of the first volume of Gibbon's *History of the Decline and Fall of the Roman Empire*, a writer who,

having been educated in the Christian religion, brought into print any statements which could be interpreted as denying the truth of Christianity, was liable to imprisonment for a term of three years. Birkbeck Hill, in his introduction to Gibbon's *Autobiography*, points out that this statutory provision may well have influenced certain reticences on the part of Gibbon in his famous fifteenth chapter and in other divisions of the history having to do with Christianity.

The law at present in force in Great Britain covering the supervision of the sale of books, prints, etc., classed as obscene or as otherwise objectionable, is that of August, 1857, known as Lord Campbell's and described as 20 and 21 Vict. 83. The House of Lords and the Chancery Judges are entrusted with the authority to forbid by injunction the publication, or the continued publication, of publications which they deem to be contempts of court. Magistrates have the power to order the seizure and the destruction of books classed as obscene. The judgment in regard to such classification appears to rest with the magistrates.

In February, 1911, an association comprising peers, prelates, and schoolmasters was organized to secure an enactment by Parliament of laws which would place British literature under an efficient official censorship, and which would make impossible the publication of any book deemed by the censors to be improper or injurious. It does not seem probable, however, that legislation of this character can now be secured.

Germany. — The Imperial Statute controlling the operations of the press in Germany dates from May 7, 1874. The provisions covering material printed in periodicals are fairly strenuous, but comparatively little attempt is made to control by statute the character of material printed in books. The statute provides that every book must specify the name of the author and editor, and the name and residence of the printer. The responsibility for criminal offenses committed through publications comprising libelous or scandalous matter, etc., is cared for under the provisions of the criminal law. A literary production cannot be confiscated without prior judicial order, application for which is made either through the police or through the state attorney. The jurisdiction of the court is confined to the tribunal elected at the place of publication. Authority is exercised directly on behalf of the executive in the enforcement of the provisions of the law of libel in regard to publications which are claimed to bring the rulers into disrespect. The offense of disrespectful utterances against the ruler is described as *Majestätsbeleidigung*.

An example of the operations of German censorship in the past century is afforded in the case of the writings of Heine. By a resolution of the Bundestag (the general assembly of the German confederation) of December, 1835, a general interdict was laid upon the

printing or distribution of all that Heine had written and of all that he might thereafter write. The initiation for this interdiction had come from the authorities of Prussia, who had convinced themselves that the peace of the realm was being interfered with by the political writings of the poet. The curiosity of this piece of censorship was the absence of any discrimination. The censors found it easier to take the ground that all of Heine's utterances should be prohibited or prevented from reaching the German people, than to discriminate between the articles in the *Allgemeine Zeitung* on political reform and the *Book of Songs*. Heine had made his home in Paris, and he succeeded in reaching some at least of his German readers by means of editions of his works printed in French. The interdiction was finally raised or passed into desuetude, as by 1840 we find Heine's publisher again announcing editions of his author's complete works.

United States — During the Colonial period a certain measure of censorship was exercised in Massachusetts and in Connecticut under the authority of the orthodox or Congregational Church, but no attempt was ever made to formulate a general censorship policy or general prohibitions.

The national government has from time to time put into force laws prohibiting the production or the distribution of certain classes of literature. No attempt has been made in these laws to protect against attacks on dogmas or theological opinions. The general purpose has been to prevent the circulation among the general public of books *contra bonos mores*. A large latitude has been allowed in the literature of politics in the matter of criticism of the existing government. The act now in force (February, 1911) affecting literature is that of Feb. 8, 1905, ch 550, 33 Stat L: "It shall be unlawful for any person to deposit with an express company or other common carrier for carriage . . . within the territory of the United States and obscene, lewd, or lascivious book, pamphlet, paper, letter, writing, print. . . . Any person who shall knowingly take from such express company or other common carrier with intent to sell, distribute, or circulate any such matter, etc., shall be fined not more than \$5000 or imprisoned at hard labor for not more than five years, or both at the discretion of the Court."

A further act of Aug. 5, 1909, Sec. 9, prohibits "All persons from importing into the United States any obscene book, pamphlet, paper, writing, or other production of an immoral nature. . . . Such prohibited articles, and the package in which they are contained in the course of importation, shall be detained by the officer of the Customs, etc." Under this latter provision, cases of books have been held up in the Customs because the shipment included a copy of Boccaccio's *Decameron* or of the original edition of Burton's *Arabian*

Nights. No one questions the propriety of preventing or restricting the circulation of obscene literature. The difficulty is, of necessity, to secure any consistent and judicious authority for determining what literature is to be so classed and what books are likely to exert a bad influence upon the morals of the community.

Action in regard to publications classed as *contra bonos mores* is also taken under state law, the laws of the several states varying very considerably according to the difference in the standards of feelings of the different communities. In a city like New York such action is usually investigated under individual effort, such as that of the Society for the Suppression of Vice.

LITERARY WHOLES. — See READING.

LITERATURE, CHILDREN'S. — A term referring mainly to books written especially for children, and including a number of types, more or less distinct, which will be noticed later. Of the history of such literature before the eighteenth century little is known. But it seems that such books must have been insignificant both in number and in importance. In primitive times there was probably little or no difference between the tales told to the children and those told to adults; in fact, the naïveté of the adult mind and that of the child were much the same.

Folklore (*qv*), consisting mainly of tales, but including also proverbs and simple verses, were the common mental entertainment and instruction for both young and old. Under folklore may be classed myths, hero stories, fairy tales, and fables. The distinction between the myth and the fairy story — the latter being more commonly included in the term "folk tale" — is not easy to draw. In general the myth is more formal, more dignified, more distinctly infused with instructional or educational purpose, and likely to be a part of the religion of the race, and to introduce gods and demi-gods. The fairy tale commonly deals with humbler motives and characters, makes a homelier appeal, and seems adapted to the entertainment of simpler minds. Its delight in the marvelous, and its disregard of unity and logic are more marked than in the myth. As between the myth and the fairy story, the latter is distinctly more juvenile. A further discussion of this humbler form of folk tale can be found in Andrew Lang's *Custom and Myth*, his Introduction to Grimm's *Tales* (Bohn), and his Introduction to Perrault's *Popular Tales* (Clarendon Press), in the Appendix to Steel's *Tales of the Punjab*, and in the publications of the Folk Lore Society.

This material has been rescued from its evanescent oral form in earlier times, partly by the use made of it in great classics like Homer and the Greek dramatists, the *Nibelungenlied*, and Chaucer; and partly by the labors of philologists or antiquarians, who have obtained it from the lips of the people, or in old books like the chap-books and the ballad collections. The most noteworthy services in this latter field are those of the brothers Grimm, who collected and fixed the German folk tales between 1840 and 1850; of La Fontaine and Perrault, who retold the French folk tales in the seventeenth century; and those of a number of scholars like John Ashton, Professor Child, and others, who have within the last quarter of a century gathered up the remaining bits of tale and verse that could be found. To this type of oral and traditional literature belong also the nursery rhymes and jingles.

Like the myth and fairy story, they are oral and traditional in their origin, and are the product not of any one mind, but of many. That is, each of them has probably been changed or added to in successive repetition. Like the other forms of primitive folklore, they make free use of the improbable, and seek to give entertainment rather than instruction. In some of them the appeal is evidently to the child's sense of intellectual play, — pure nonsense verse. Others bear the marks of historical events referred to playfully for the amusement of the nursery. The famous *Sing a Song of Sixpence*, for example, seems to point to the Gunpowder Plot, *My Lady Wind* to the great fire of London. The latter is, also, like a few others, clearly instructional and ethical, and still others belong to the class of riddles. In the publications of the Percy Society (Vol. IV) is to be found an interesting collection of this old-fashioned juvenile verse.

Another general type of books for children consists of the classics written for adults, but coming within the comprehension and the range of interests of children. Prominent among these are parts of Homer and the Bible, the *Arabian Nights*, *Robinson Crusoe*, *Gulliver's Travels*, and *The Pilgrim's Progress*. In these the appeal to the child is mainly in the simplicity and boldness of imagery, in the action, and in the simple and heroic elements of character. Whatever they contain of the analytic, the introspective, or the symbolic is likely to escape him. His enjoyment of Christian's conflict with Apollon or of the experiences in the castle of Giant Despair is quite apart from the theological meaning involved; nor does it ever occur to him that the marvels told by Gulliver conceal a bitter satire against humanity. It should be added that the line between books suitable for adults and those adapted for children is further obscured in the case of much fiction and poetry. Scott and Dickens and Stevenson become the property of many children after the age of twelve; and much of the poetry of Wordsworth, Tennyson, Whittier, Longfellow, and others can be appreciated by children at a very early age. So that any good collection of reading made for children will contain many books not written primarily for them.

The third general class of children's books comprises those written primarily for children. This class, whose history is but recent and comprises scarce 500 years, has now become the largest and in some respects the most important. Interwoven as it is with the changes in the general attitude toward children, it reflects both the educational and the social ideals of the various periods in which the books appeared.

The earliest of these books in England, dating from the fifteenth century, such as *The Babees Book*, and *The Boke of Curteisie*, were devoted to instruction in manners and morals, given in the form of direct and positive precepts. What this type of book was like may be seen

in the reprint of several of them in the publications of the Percy Society, Vol. IV. A fair specimen of the popular attempt at writing for the young may be seen also in the eighteenth-century chap-books, small sheets with stories or verses, generally sensational, and making the same sort of appeal as our modern "yellow journals."

Writing for children, however, may be said scarcely to have begun until the second half of the eighteenth century. Indeed, the interest in childhood seems, as reflected in the literature of the sixteenth and seventeenth centuries, to have been either non-existent or totally different from what it is now. Children were of interest, not for themselves, but only because they would become men and women later. Hence much of the teaching addressed to them, in books at least, regards them as small men and women. Even Shakespeare, whose range of view was so wide, seldom makes use of the love of children as a motive; and when he does, in rare instances, introduce a child into one of his plays, he makes the child precocious and priggish, — a child playing at being a man. From this something of the general attitude toward children in the days of Elizabeth can be gleaned.

Many of the important educational and social ideas of the nineteenth century had their roots in the eighteenth. To the eighteenth century must be assigned the beginnings of the modern attitude toward children and their education. The writings of Rousseau, Froebel, Pestalozzi, Basedow (*qq v*), and others created and reflected a new interest in children, and the desire to adapt educational methods to their natures. One of the earliest results of this new movement was Weisze's *Kinderfreund* (*Children's Friend*), a paper for children published in Leipzig. This same title was taken by Von Rochow (*q v*) for his *Primer*, a book that was intended to supply children with reading matter that should interest and please as well as instruct. In its teaching it was moral, rather than strictly religious, as earlier school-books had been, and it conveyed its lesson in tales and songs. It was the first true school reading book. Its success was great and immediate. It went through many editions, and was translated into French, Dutch, Danish, and other languages.

The effect of educational ideals and purposes upon juvenile literature is especially marked in Germany. Under the influence of the Philanthropists, Basedow and others, there arose a type of literature addressed to the understandings of children and uneducated adults. This general movement includes not only the work of Von Rochow and others mentioned above, but books like those of Campe and Salzmann (*qq.v.*), who carried on the traditions and work of the Philanthropists. Their books, addressed to undeveloped minds, conveyed both teaching and information in the

form of popular tales. Although they were of mediocre quality, from a literary point of view, they are of great interest in the evolution of juvenile literature. To the same general movement is to be assigned, in part, the popularity of *Robinson Crusoe* and of the many translations and imitations of it. Except the *Swiss Family Robinson*, by Johann Wyss, few of these imitations have survived. But for a quarter of a century they constituted a considerable part of the juvenile and the popular literature; and, for adults, a vehicle for various kinds of ethical and political propaganda.

The present important place of the folk tales, or *Marchen*, was practically secured when the brothers Grimm issued their famous collection, based to some extent on the work of Perrault (see Lang's edition of *Perrault's Popular Tales*, Oxford, 1888), in the second decade of the nineteenth century. Since that time the fairy story and folk story have been almost unchallenged in the nursery and the school. The old motives, like those of Cinderella, have been used over and over, and new motives of like interest have been invented. Easily the most distinguished successor of the brothers Grimm in this field is Hans Christian Andersen, whose distinctive work is rather that of the imaginative inventor of tales than of the discoverer of old and forgotten stories.

The attempt to supply interesting reading for children comes a little later in England, but by the beginning of the nineteenth century it is well under way. Three or four streams of influence may be distinctly traced. The Rousseau influence — and the pedagogic interest in general — are seen in the works of Thomas Day (*q v*), the author of the long popular and still well remembered *Sandford and Merton*; and in the books of Maria Edgeworth (*q v*). Her *Parents' Assistant* and other collections of tales and plays for young people were in their day very popular. They are distinctly instructional in character. Their conception of education was the learning of facts and the carrying out of iterated moral precepts. For the glamor of the marvelous and impossible, for the spirit of mere play, they had no place. It is probable that both Miss Edgeworth and her father (see EDGEWORTH, RICHARD LOVELL), — whose influence determined the character and aims of her work, — could they have read *Alice in Wonderland*, would have thought it merely a very silly book. She had little real understanding of the nature of children; or, if she had, she kept it out of her writing. And, it must be confessed, the children whom she put into her books are rather tedious little prigs. The same general comments will apply to Day's *Sandford and Merton*. Both he and Miss Edgeworth, however, have created a few scenes which stand out clear and strong. But for the most part their books and all others of their school of writing have gone to the limbo of libraries. It is, indeed, inconceivable that

they could have held their own in competition with the bright, buoyant, and sympathetic books for children that came two generations later.

Another influence of the end of the eighteenth century, which led to the rise of a definite type of books, is the Sunday school movement. This movement, begun by Robert Raikes, carried on also by Hannah More and Mrs. Trimmer (*qq.v.*), is by no means an unimportant factor in the social history of the time. The leaders of the movement were not mere religious fanatics. They saw in the Sunday school a means for a much needed social regeneration among the poor. Hannah More and Mrs. Trimmer were both women not only of courage and energy, but of considerable intellectual power. Their books for the young now seem stilted in style, much too didactic in their presentation of morals, too definitely preceptorial and instructional, and too religious. Like most juvenile books of the period, they make one wonder what depraved young people they were intended for. But judged by their own time and purpose, they were effective and good. It is rather the host of later imitations, under the general head of "Sunday school books," that by their exaggerated sentimentalism, their ignorance and their false pictures of life and false standards, have brought the very name of Sunday school into reproach.

To the end of the eighteenth and the early nineteenth centuries must be assigned also the beginnings of juvenile books of literary standard. The classic *Goody Two-Shoes* is now commonly ascribed to no less a genius than Goldsmith. Charles and Mary Lamb rewrote the stories of the *Odyssey* and the tales of Shakespeare's plays for the young readers, and composed verses — most of them not very happy, it must be confessed — for children. William Blake, himself a gifted and mystical child in some respects, wrote the *Songs of Innocence*, many of which stand in the front rank of juvenile poetry. Wordsworth, though not in the least intending it, wrote some poems which have come to belong to the children more than to their elders. Isaac Watts struck out, among a mass of sententious commonplaces, a few poems that are now children's classics. And the Taylor sisters, Jane and Ann, have given us a number of things that the wise teacher would not willingly let die.

In America it is customary to trace the rise of children's books from the introduction of the famous *New England Primer*. Introduced about 1670 (a modified form of an earlier English book, which in turn has been traced back to a Protestant *Primer* produced on the suggestion of King Henry VIII), the *New England Primer* was for a hundred years or more the principal book for young pupils. It was almost entirely religious in its material, stern and uncompromising in its Puritan spirit. To the modern scientific mind its dogmatism

and its sternness seem to have an element of the grotesque. But the historical and literary mind cannot but see in it something of the grave dignity and somber imagination of the old Puritans. The long life of this little book served to make it a good illustration of the way in which schoolbooks reflect the spirit of their time. For the book gradually became secularized in successive editions, until, at the end of the eighteenth century, its exclusively Puritan material had made place in large part for other ideas. How interesting the life of this little book was may be seen in Paul Leicester Ford's scholarly work, *The History of the New England Primer*.

Interesting also is the history of the *Mother Goose* collection of folk story. Mr. Montrose J. Moses, in his excellent work, *Children's Books and Reading*, says, "The name Mother Goose is first heard of in the seventeenth century. During 1697 Perrault published his *Histoires ou Contes du Temps Passé avec des Moralitez*, with a frontispiece of an old woman telling stories to an interested group. Upon a placard by her side was lettered the significant title:

CONTES
DE MA
MÈRE
LOYE.

There is no doubt, therefore, that the name was not of Boston origin . . . An English edition appeared at the Hague in 1745. This seems to be the first introduction into England of *The Mother Goose Fairy Tales*." It was John Newberry, Goldsmith's publisher, who, about 1760, issued the English nursery rhymes under the name of *Mother Goose Melodies*, and it is supposed that Goldsmith himself assisted in making the collection. Thus it has come about that in England and America the name Mother Goose is associated, not as originally with fairy tales, but with the old English nursery rhymes.

With the gradual change in national ideals, both schoolbooks and other juvenile books drew away from the strictly religious type and reflected other American ideals. In the early half of the nineteenth century there appeared many compilations of extracts from literature adapted to declamation. In that rather flamboyant period of our national life speech-making stood in high repute, and was, indeed, one of the commonest roads to fame and fortune. In the same period there were also American books corresponding to those of the instructional type in England. The most popular of these were probably the *Peter Parley* books, written by Samuel G. Goodrich. History, geography, and other information were served up in them in simple form. The history was often rather unhistorical, and the science sadly unscientific. But they were better than nothing, and better than the unwholesome "Sunday school book." In the same class are the *Rollo* books by Jacob Abbott (*q.v.*).

These, which numbered a score or more, were descriptions of travel and of other things, and were composed mainly of conversations in which voluminous information was imparted to Rollo's inquiring mind by "Uncle George." The information was generally interesting, though the style was diffuse; and on the whole the books must be set down as of the better sort.

About 1850 there arose another *genre*, the book of adventure. This type may be traced to Cooper's tales of Indian life and of the sea. His imitators were of course far below him in genius. But their books were full of action, and the thrills of the thousands of boy readers were undisturbed by any sense of the wild improbability of incident or the absurd psychology of the characters. These "dime novels," as they were commonly called, flourished for more than a quarter of a century. They were issued as complete volumes and also as serials in weekly or monthly family story papers. They have been largely supplanted now by the better books, mainly through our system of public libraries. But they are not yet an extinct species; and the crusade against them is not yet over.

It now remains to survey the field as it is to-day, to attempt an analysis of the influences at work, and a classification of the kinds of books available. Even a brief survey of the field impresses one with the wealth of material. Thousands of books are to be had whose external form is attractive, whose style is good, and whose material is sound and wholesome. Notable contributions have been made also to the art that portrays children for children from Kate Greenaway's work to that of Jessie Wilcox Smith. Instead of the crude drawing and ill-made woodcuts that once adorned juvenile books, we now have illustrations, plain and colored, that are not only adapted to the child, but that give satisfaction even to the critical adult. Scores of gifted writers, who in former times would have written only for adults, now write also for children. There is a steady stream of them, from Lewis Carroll and Charles Kingsley to Stockton and Kipling.

The first and most obvious cause is the increase in the sympathy and intelligence with which children are regarded. We have come not only to see the social and economic value of children, but to care more for them. And so we have come to identify our interests with theirs, to see things through their eyes, in a way in which our forefathers could not. The kindergarten may often have been over-sentimental and even absurd in this; but its contributions to good children's literature are undoubted. Notable among books showing this influence are the rhymes of Emilie Poulsson and the stories of Kate Douglas Wiggin.

In the same direction is the influence of modern psychology, and especially that branch of it commonly called "child study" (*q.v.*).

This has given new dignity to the lives of children; has made their thoughts and emotions not less worthy of literary treatment than those of adults. Modern psychology has also its literary as well as its scientific side; that is, our writers as well as our scientists attempt to analyze the human mind truly. Such books as Mrs. Martin's *Emmy Lou* and Howells' *A Boy's Town* would hardly have been possible in an unpsychological age. One of the most significant kinds of book in this connection is that which treats of children, though written for adults; like Kenneth Grahame's *The Golden Age* or Gilson's *In the Morning Glow*.

Perhaps the most potent cause of this fullness of juvenile literature is, however, to be found in the general temper of the age, in its higher regard for all human life, its greater tenderness, its greater understanding of the weak. The distance is long between it and the bitter, somber sternness of Puritan days.

Not merely the number but the variety also of juvenile books makes classification difficult. Of folklore we have many varieties and many versions from the Greek and Norse myths to Joel Chandler Harris's delightful negro tales from the mouth of Uncle Remus; from the early tales of chivalry to the homely folk stories of almost all the countries of Europe and Asia.

The modern fairy tale, sometimes serious and sometimes humorous, extends from Lewis Carroll, through a long series including books like those of Howard Pyle, Stockton, Kingsley, Collodi (translated from the Italian), Mrs. Ewing, Mrs. Craik, Macdonald, Ruskin, and Thackeray. Stories of child life include books by Mrs. Burnett, Mrs. Craik, Mrs. Ewing, Hawthorne, Kipling, Mrs. Martin, Ouida, Mrs. Wiggin, Louisa Alcott, Carolyn Wells, Aldrich, Howells, Boyesen, Daudet, Hughes, Warner, and Trowbridge. Under tales of adventure there are the Indian story, the sea tale, the pioneer, and the explorer. Here appear authors like Cooper, Scott, Parkman, Simms, Stewart Edward White, Dana, Defoe, Sir S. W. Baker, Mary Mapes Dodge, Irving, Kipling, Roosevelt, Stevenson, Schwatka, Bullen, and Clark Russell: a plentiful assortment of fact and fiction, variously mixed.

The list of historical tales is long; some of them, beginning with Scott, are extremely good. Then there are the books geographically distinguished: books of the Arctic region, of the tropics, of Asia and Africa and Europe, and of the South and West of the United States, and, as a matter of course, of New England, the first section of our country to develop an extensive literary consciousness. The list of biographies is long; but not equal as yet in general literary qualities to other kinds of books. Good biographies for children are yet needed.

Stories of animal life and easy scientific books on out-of-door life are good, numerous,

LITERATURE, CHILDREN'S

and rapidly increasing in number. With these latter must be classed the books dealing with invention, discovery, and general science.

Among the children's poets Stevenson seems easily first. Frank Dempster Sherman, Eugene Field, James Whitcomb Riley, Celia Thaxter, and others have written poetry for children which they love to hear and to read.

The list of strictly humorous work is not long, though good. But it must be remembered that humor is likely to be found now in most juvenile stories and verses.

Finally, a good many anthologies of poetry, songs set to music, and fairy tales have been made. Whittier published two, one of prose and one of verse. Patmore, Palgrave, Lang, Kate Douglas Wiggin, Mary E. Burt, E. V. Lucas, and others have made good collections. An ambitious and successful attempt at collecting a large mass of children's reading under the title of *The Children's Hour*, in ten volumes, has recently been made by one firm of publishers. Even the school readers might often be cited as good anthologies of verse and prose. Indeed, the standard is determined far more by the school and the public library than by the home.

LITERATURE, COMPARATIVE. — An English equivalent for the foreign terms, *Vergleichende Literaturgeschichte*, *Littérature comparée*, *Letteratura comparata*, coined in apparent analogy with such expressions as "comparative anatomy" and "comparative philology." Its use in English is of fairly recent date, and the word can hardly be said to have had any wide currency until 1886, when Posnett used it as the title of a book in the International Science Series; but it soon impressed itself on literary scholarship, and ten years later Professor Marsh of Harvard could say that "the phrase Comparative Literature is afloat, and indeed seems to be constantly gaining in currency."

As early as 1863 the distinguished Italian critic, Francesco de Sanctis, had been created professor of comparative literature in the University of Naples without stipend; but it was not until 1871, when he was reappointed by royal decree, that he actually occupied the chair. During four academic years he lectured at the university with occasional intermissions, finally resigning on account of his health in 1877. With De Sanctis, therefore, the academic history of comparative literature begins. His work was for the most part confined to

Italian literature, but included a course of lectures on the history of literary criticism from Aristotle to Hegel, the manuscript of which has recently been discovered. The remarkable impression he made on his pupils, among whom were numbered Gaspary and Torraca, has been recorded by the latter in a pamphlet, *Dal "Libro della Scuola" di Francesco de Sanctis, MDCCCLXXII* (Rome, 1885), and seems to have been due to the personality of the man as much as to the talents of the scholar and teacher. His æsthetic theory owed much to Hegel and other German thinkers, while his critical method was in part derived from Sainte-Beuve. In interpreting literature, more particularly that of his own country, along these lines, and in expounding the fundamental principles of literary art, he conceived that he was justifying the title of his chair. The effect of his teaching was to broaden the study of literature in Italy, liberating it from mere pedantic detail; and he may be said to have founded a new Italian school of æsthetic criticism.

The development of comparative literature during the next decade, however, was not along the lines set by De Sanctis. The Hegelian Carrière carried on a similar tradition when, in 1881, he republished a work on *Die Poesie, ihr Wesen und ihre Formen* (which had first appeared some thirty years before), and added to its title the phrase, *mit Grundzügen der vergleichenden Literaturgeschichte*. But the tendency of the decade was toward a more precise delimitation of the field and a more scientific treatment of its subject matter. Posnett, in his book on *Comparative Literature* (London, 1886), conceived it to be a rigid science, concerned with the origins of literature and with the development of set poetic themes, a science allied to anthropology and folklore. In the next year Professor Max Koch of Breslau founded the *Zeitschrift für vergleichende Literaturgeschichte*, the first journal devoted exclusively to the advancement of comparative literature; and the founder in his announcement of the new venture limited the field to the scientific study of poetic themes, of literary sources, of the influence of one literature on another, and the like. During the nineties the subject received a remarkable impetus in the universities of Europe and America, and no less than four chairs were founded in this decade. Joseph Texte at Lyons, Louis P. Betz at Zurich, Arthur R. Marsh at Harvard University, and George E. Woodberry at Columbia University, were the pioneers in their respective countries; in 1900 Fernand Baldensperger succeeded Texte at Lyons, and in 1902 Francesco Torraca was appointed to the chair which De Sanctis had once occupied at Naples.

Of the five pioneers enumerated above, Joseph Texte, though the youngest, was the first to impress on the study of comparative

literature the special significance which it has mainly continued to possess in academic instruction. His study of Rousseau as the founder of "literary cosmopolitanism" in Europe, and his *Études de Littérature Européenne*, indicate the general trend of his interest in the problems of literary relationship between the various countries of western Europe, especially during the eighteenth century. His early death in 1900 cut short a brilliant career, just at the moment when a chair of comparative literature was about to be founded for him at the University of Paris. His successor at Lyons, Fernand Baldensperger, has continued in the same regions of research, but with a particular interest in the literary relations of Germany, France, and England during the romantic period (e.g. *Goethe en France*, 1904). In Switzerland Louis P. Betz cultivated similar studies, investigating the influence of Poe and Heine in France, the origins of literary journalism at the end of the seventeenth century, and a wide range of problems of this kind. In 1900 he published a bibliography of the young science to which he was devoting his life (*La Littérature comparée; Essai bibliographique*); this compilation, the first of its kind, limits comparative literature to *Quellenforschung*, that is, to the investigation of literary sources and international influences. After his death a second edition (1904) was brought out by Baldensperger, with its scope slightly extended.

In Germany the opportunities for minute research which the new *Quellenforschung* afforded were soon realized by academic teachers; and a mass of material of this kind, much of it of slight value, has issued from the German universities during the last twenty years. In 1887 Professor Max Koch of Breslau founded the periodical already referred to; and somewhat later Professor W. Wetz, who succeeded him as editor of that journal, was called to a chair at Freiburg i. B., which he has chiefly devoted to the teaching of comparative literature. Professor Wetz's conception of his field, as expounded and illustrated in his *Shakespeare* and other works, is widely divergent from that of most of his German contemporaries. He conceives of it as a comparison not of externals, but of essentials, the comparison of one artistic method with another, of the genius of Shakespeare, for example, with that of Corneille or Calderon. As yet no German chair has been officially devoted to the subject, but doctoral monographs on comparative subjects are now issuing from the departments of modern literature in almost every German university.

The courses of Professor Child of Harvard on Chaucer and on ballad literature, as well as those of Longfellow, Lowell, and Norton on Dante, furnished the initial impulse to comparative studies at American universities; and it was at Harvard that the first

chair of comparative literature was instituted. Professor Arthur R. Marsh continued mainly the medieval studies of his predecessors, coordinating them, however, by the fruitful idea of *Welllitteratur*. His academic title was "assistant professor of comparative literature"; and to that title, when he resigned from the university, Jefferson B. Fletcher succeeded in 1902. At Columbia University the Department of Literature, with George E. Woodbury as its head, had been inaugurated as early as 1890; and here, for the first time in any American institution, the study of literature was separated from all linguistic or philological detail, as a division of the field of learning, and the whole realm of European culture taken as its province. Professor Brander Matthews lectured on the evolution of the novel and the drama; and Professor Woodberry's lectures on the great monuments of European literature, on epic poetry, on the theory and practice of criticism may be read, in revised form, in his *Heart of Man* (1899), *The Torch* (1905), *Great Writers* (1907), and other works. In 1899 the first Department of Comparative Literature in an American university was inaugurated. An early result was the institution of a series of "Columbia University Studies in Comparative Literature," which included monographs on such varied subjects as *Platonism in English Poetry*, *Romances of Roguery*, *Spanish Literature in the England of the Tudors*, *A History of Literary Criticism in the Renaissance*, *The Classical Heritage of the Middle Ages*, *The Italian Renaissance in England*, and *Irish Life in Irish Fiction*. The *Journal of Comparative Literature* was founded in 1903, but discontinued publication at the end of one year. The Ropes Chair of comparative literature at the university of Cincinnati, founded in 1908, completes the academic roll-call in this country. At the present time (1910) four scholars in the United States, one each in Switzerland, France, and Italy bear the title of professor of comparative literature; but the number of other scholars actually carrying on investigations in this field is not to be estimated merely by this small array. To say that most of the teachers of modern literature in European and American universities connect themselves in some way with the field, either in their teaching or in their published work, would not be wide of the mark. England is still without a chair of comparative literature, though the unique Professorship of Poetry at Oxford continues to furnish opportunities for the discussion of comparative criticism; and such works as Professor Saintsbury's series of *Periods of European Literature*, as well as his own *History of Criticism and Literary Taste in Europe*, illustrate the growth of these studies in the British Isles.

Comparative literature has thus been variously conceived as (1) a form of literary antiquarianism, involving especially the external

facts of the influence of one literature on another, of the literary sources of books, and the like; (2) the study of *Welllitteratur*, involving especially the history of literary periods, movements, types, or themes; and (3) the æsthetic criticism of literature, with incidental study of poetic principles, as a protest against literary antiquarianism. Literary scholars, from the days of ancient Rome to the end of the eighteenth century, employed the comparative method, in the sense of contrasting one author or one literature with another. But the search for a connecting link of spiritual or artistic unity in all the literatures of the world did not begin until the days of Herder; and with Goethe's idea of a *Welllitteratur* comparative literature was really born (see his *Fermeres über Welllitteratur*, 1829, in *Sämtliche Werke*, Jubiläums-Ausgabe, pp. xxxviii, 202). Matthew Arnold's dictum that "that criticism which alone can much help us for the future is a criticism which regards Europe as being for intellectual and spiritual purposes one great federation bound to a joint action and working to a common result" is a logical consequence of Goethe's idea, though Arnold has narrowed it from World Literature to European Literature. This has indeed been the general, though not the invariable, practice of scholarship; and perhaps the unity of literature is more easily apprehended when its study is confined to a single civilization like that of Europe. Literary study, conceived in this spirit, does not concern itself with each national literature as a separate and sporadic fact of history, but rather with the great international movements or types of literature, with the great literary periods, or with the interrelations of one literature with another. Academically, this has tended to break down the barriers which have separated the departments of English, French, German, etc., and ultimately the very existence of such separate departments is likely to be threatened. When that is brought about, there will no longer be need for a distinct department of comparative literature. In this sense, comparative literature has been, not a special field of research or criticism, but a method applicable alike to all fields of literary study, and its usefulness as a separate entity will cease when that method has been universally adopted. But its real field is nothing more or less than the history and criticism of literature, and though its students may limit themselves to some special phase of this wide subject, the best of them acknowledge the larger and truer allegiance, when they use the term "comparative literature" as a banner and a battle-cry.

LITERATURE, EDUCATIONAL. — See BIBLIOGRAPHIES OF EDUCATION; ENCYCLOPEDIAS OF EDUCATION; JOURNALS, EDUCATIONAL; and the reference list appended to the various articles on education in these volumes.

LITERATURE, ENGLISH, TEACHING OF. — As early as Plato the fundamental theoretical principles which underlie the teaching of literature were already clearly stated. In the *Gorgias* the character who gives the name to this dialogue maintains that he has elaborated an art, the art of rhetoric, which is communicable by teaching and which will assure to the practitioner of that art the greatest possible happiness. Plato, on the other hand, if we may assume that Isocrates expresses Plato's opinions, maintains that what Gorgias calls an art is a false art, is merely flattery (cf. the place which is assigned to the poet in the *Republic*), and that real power has to do only with the perception of and control over that inner truth which is each man's possession in varying degrees by gift of nature, and that consequently there is no communicable art of expression based upon sound moral principles. To these two views, both manifestly presented in the extreme, should be added a third, set forth in the *Ion*. This is the doctrine of "secondary inspiration," according to which certain persons whose spirits are attuned in a peculiar manner to the writings of some specific master of literature are thus enabled to put themselves with respect to these writings into a sympathetic mood of enthusiasm which is similar to the mood of the author in composing them, and which in a certain degree is communicable to others. To illustrate this idea, Plato uses the figure of the magnetic rings. The first ring, representing the original author himself, receives its power directly from God, the source of all inspiration. The second ring, representing the interpreter of the author's writings, hangs from the first ring by means of a magnetic power derived from the original source through the medium of the first ring. In the same way a third ring may be attached to the second ring by means of a magnetic power derived through the medium of the first and second rings, and this magnetic power may continue

indefinitely to be thus transmitted so long as it is strong enough to enable one ring to hold to another. In the case of a great writer like Homer, the rings may form a long chain, although by the time we get to the last ring but little of the original inspiration of Homer is left. The three principal points, therefore, which are represented in these two dialogues, expressed in terms of modern thought, are, first, the possibility of teaching the technique of an art of literature; second, the necessity of basing literature not upon technique, but upon personal character, which is not communicable and consequently not teachable; and third, the transmission of the elements of personal character not completely but in an imperfect manner by means of sympathetic appreciation or secondary inspiration. If we add to these principles a conception not possible in Plato's time, the conception of a history or development of literature, we shall have all the main ideas which underlie the modern teaching of the subject. (For the development of the study of English literature see **VERNACULARS, TEACHING OF THE.**)

English Literature in the Elementary and Secondary Schools. — The question of the advisability of teaching literature in the modern elementary and secondary schools appears to have been definitely answered by actual experience. Through the various stages of the elocutionary speaking of "pieces," the use of reading books, and finally the detailed and formal study of English classics, the study of literature has gradually taken its place in the school curriculum, although it is only within the present generation that extensive and specific provision has been made for such study. The cause and the justification for the contemporary emphasis placed upon the study of the English language and literature are intimately bound up with the democratic tendencies in general of both language and literature within the last three generations. English literature, beginning with the reforms of the late eighteenth and early nineteenth centuries, has become more and more in its modern manifestations an expression of general social ideas and emotions than it has ever been before, and its range of appeal has consequently become wider. Moreover, the modern school, in the extraordinary expansion by which it has assumed to itself many different kinds of activity, left by the earlier school either to the limited instruction of the parent or of special masters, has at the same time assumed certain responsibilities, necessarily arising from the instruction which the school provides in the elements of these new subjects for the public at large. Thus in teaching practically every member of the community how to read and write, the school has placed within the reach of all the elements necessary to the understanding and the practice of the literary art. Having provided the general public with the key of

admission to the treasury of English literature, modern education cannot consistently abandon the public thereafter to its own undisciplined devices. A system of universal popular education logically demands that attention be given to so influential an element as literature in the life of the people; and in answer to this demand, from the lowest grades through the secondary school, the college, and the university, the study of the literature of the vernacular has come to occupy an important, and, on the whole, unquestioned place. The debatable question is no longer whether English literature shall be taught to English students, but how and with what varying degrees of emphasis it shall be taught.

Perhaps the most important single result of modern practical experience has been the turning aside from matters of information about authors and literature, as exemplified in the old-fashioned manuals of the history of literature, to an attempt at appreciation directly of the literary monuments themselves. It is now generally recognized that historical and biographical information with respect to literature is of secondary value, and that it finds its justification in instruction only when it helps the student to a truer appreciation of the literary product. The study of literature is not, therefore, an appendage to the study of history; and this is especially true in the elementary teaching of literature. The details of historical and biographical information are matters of scholarship, whereas the proper understanding of literature in its simplicity is not primarily a matter of scholarship, but rather of sensibility and feeling.

At the same time it is recognized that the teaching of elementary English literature is not altogether a matter of sensibility and feeling, and that it has elements of a severer intellectual discipline in it. In the first place, all literary expression is made up of words, and an intelligent understanding of the meanings and connotations of words is absolutely necessary to any adequate appreciation of literary monuments. The teacher, therefore, must gauge the capabilities of students with respect to the vocabulary of the literary expression under examination in such a way as to make sure that their understanding is not only clear, but also in accordance with the normal traditional usages of the language. It is not enough that students should have a definite impression of a work of literature; they must also have correct impressions. In acquiring this right understanding of words, which, as Plato has justly said, is the basis of scholarship, the teacher's most intelligent judgment and oversight are necessary. Obviously the study of a literary monument the expression of which is so far beyond the comprehension of the student that his attention is completely taken up with details, leaving him no energy for the synthesis of his impressions, should be deferred

until the student has at his command a wider range both of vocabulary and of modes of thought.

Another kind of definite fact which the elementary teacher of literature may not neglect is that which has to do with certain forms of phrasing peculiar to the literary style, especially the use of figurative language. These modes of expression are usually quite outside the student's natural colloquial experience, and unless they are specifically analyzed, the significance of them is not clearly realized, even when the individual words are intelligible. It is the frequent experience of all teachers of English literature that even fairly mature students are unable to see the value of a metaphorical expression, an inability which arises not so much from an inactive intelligence as it does from unfamiliarity with the literary convention contained in the manner of expression. The study of literary style, as it was developed in the early manuals of rhetoric, and as it was based upon the study of the Greek and Latin classics, limited itself almost exclusively to the analysis and classification of figures and metaphors. The futility of all such classification merely for the sake of classification acknowledged, it must be granted also that, within proper bounds, the analysis of metaphorical expression is justifiable and necessary.

Still a third group of facts to be noted in the disciplinary study of elementary literature consists of allusions, proper names, and other matters of information embodied in the text, the understanding of which is necessary for the proper grasping of the writer's intention. Here again it is apparent that works such as some of the satires of Dryden and Pope, in which the local and contemporary allusions are so numerous as to absorb all the student's attention, are hardly appropriate material for elementary instruction.

When stress is placed heavily upon these details of fact, that is, on vocabulary, figures, allusions, etc., the result is what is often called the "philological" method of the study of literature. This kind of literary study, which arose out of a desire to give the study what was considered a disciplinary value, was much more in vogue in a preceding generation than it is at present. The study of figures of speech, for example, was made a very technical drill in the classification of the figures under the heads of an elaborate and pedantic system of classical terminology. In the same way the study of vocabulary was, and often continues to be, carried to extremes in the consideration of the etymological origins of the various words, or their comparative uses by different writers, and similar questions. The study of grammar is often combined with the study of literature, and teachers have been known to compel students to parse through every word of *In Memoriam* under the pretense of a literary

study of that poem. It is perhaps sufficient to point out here that the philological method when carried to such extremes does not answer the requirements of the study of literature, however valuable it may be as a technical drill in language. The common-sense conclusion seems to be that a piece of literature should not be taken up, at least in elementary or secondary instruction, when it requires such elaborate linguistic commentary that the student's attention and energy are completely abstracted from the appreciation and enjoyment of the work merely as literature.

The more subtle questions of technique, such as those which have to do with form or structure in the larger sense, the differentiation of types, the conventions of individual types, etc., are usually, and may very well be, disregarded in elementary instruction. With the most mature students the interest of these questions with respect to literature may be considered as esoteric, and with younger students much more limited in power of abstract thought, the dwelling upon them is merely confusing. There is perhaps somewhat more justification in dwelling upon historical considerations, e.g. the period at which a work was written and the particular contemporary circumstances of its composition. Such details are often helpful in grasping the meaning of a work as a whole. But it is doubtful if students should be much troubled with attempts to group writers into periods, or to appreciate large general movements, like classicism and romanticism, in the earlier stages of their literary training. The usual plan of reserving such considerations for the last year of the secondary curriculum or for the college seems to be the wisest.

As to the question of transmitting appreciation for the literary monument itself, after all matters of technical detail have been disposed of, apparently little that is of practical value can be said. It will be generally conceded that Plato was right when he declared that there was no communicable technique for the best aspects of literature, and that a right feeling, "a secondary inspiration," will accomplish more than the most ingenious technical analysis. And as the Greek rhapsodists gave expression to this secondary inspiration mainly by reciting the works of the authors who inspired them, so in elementary instruction intelligent reading is often more effective than elaborate commentary.

One other aspect of the elementary study of literature presents itself insistently to the teacher, and this is the question of the relation of the study of literature to the study of morals, ideas, and civilization in general. It is obvious that the possibilities of correlations of this kind in literary study are almost illimitable in extent. No other kind of expression has summed up so directly and so compactly as English literature has done the ideas

and forces which have exerted influence upon the thought of the English people. Any adequate study of the monuments of English literature must consequently and of necessity lead over into a consideration of moral ideas. The study of *The Merchant of Venice*, of *Silas Marner*, of *The Ancient Mariner*, to choose a few examples at random, inevitably raises in each instance important questions of moral conduct which are inherent in the very conception of the works. The endeavor to exclude such discussions by limiting the choice of texts read to simple narrative, like Scott's narrative poems, seems hardly defensible, since it excludes what must be regarded as the most characteristic products of English literature. Here again a balanced and common-sense attitude toward the question of moral instruction in the teaching of literature seems to be the only one tenable. To make literature merely the vehicle for the conveyance of moral instruction, to torture a moral lesson out of every innocent poem or tale, changes the subject from the study of literature to the study of ethics, besides frequently destroying for the student the characteristic charm of the writings under consideration. On the other hand, the moral and didactic implications of many of the most important monuments of English literature cannot be disregarded without slighting what is after all one of the most persistent and prominent characteristics of the whole history of that literature.

The question of grading the material used in literary study may naturally be answered variously according to the attendant circumstances. In general, however, in the early years of the elementary pupil's development, the most appropriate material will be found in fairy tales, folk tales (see *FOLKLORE*), myths, and simplified forms of epic narrative. The next stage in the development of popular narrative, and the one which is most appropriate for study in the later years of the elementary school, is represented by the romantic tales of chivalry, such as the stories of King Arthur and other medieval romances, as well as chivalric stories from actual history. In the secondary school, on the other hand, considerably more attention is paid, and appropriately so, to writings which are specifically works of literary art, and which consequently bear the marks of conscious literary artifice, such, for example, as the list of "English Classics" prescribed for reading and study in preparation for entrance into college.

English Literature in the College. — In the American college, the study of English literature has advanced steadily with the growth in general of the scope of college instruction. The subject was given its first strong impulse through the academic influence of men like Longfellow, James Russell Lowell, Charles Eliot Norton, and Professor Child, in New England, of Henry Reed, professor of English

literature in the University of Pennsylvania from 1831 to 1854, of Hiram Corson, now professor emeritus in Cornell University, and active professor of English literature from 1870 to 1903, and others in various parts of the country, and now is a recognized and important part of the instruction in all courses leading to the bachelor's degree. In the English universities the introduction of the subject came much later and its progress has been slower. At Oxford English literature was not introduced as a separate school of the university until the last decade of the nineteenth century. "At the first examination, which was in 1890, two candidates offered themselves, but as one scratched before the paper work began and the other as soon as it ended, there was no class-list. In 1897 the names of four men appeared in the class-list; in 1898, five; in 1899, four; in 1900, three; in 1901, two. People began to complain that the school was not as productive as they had expected, and even blamed the University. . . . Several sages declared that the subject was in fault, and that, as they had said all along, English was not a subject which could be seriously studied in an English University." (Firth, *The School of English Language and Literature*, pp. 34-35) "It was pointed out that while male candidates could be counted on the fingers of one hand, women candidates entered for the school in large numbers, and it was inferred that the subject was not a suitable subject for men" (Firth, *ibid.*, p. 35.) The real explanation, however, seems to have been that, although the university had provided for examinations in English literature, neither the university nor the colleges, except the women's colleges, had provided for instruction. This defect was in part remedied by the appointment of Professor Raleigh to the professorship of English Literature in 1904, and by various other appointments and changes in administration both by the college and the university before and after this. "But in 1907 and in 1908 the class-list at last revealed signs of real progress. There were in the first year twelve men and seventeen women, and in the second year, twelve men and thirteen women. This increase continued, and now, in Hilary Term, 1909, there are forty-nine men reading for the school, and fifty-six women." (Firth, *ibid.*, p. 38.)

The principles which may be assumed to underlie the teaching of literature in courses leading to the bachelor's degree differ from those at the basis of elementary and secondary instruction less in kind than in the extent to which they are applied. With increased maturity in years the student is capable of studying writings of greater complexity and subtlety of thought, and of greater difficulty on the side of expression. But in the colleges also the main purpose of the teaching of literature is to bring students to a firsthand acquaintance

with and appreciation of that which is regarded as good in literature. In the college, however, more attention is usually given to the formulation of conscious standards of taste and judgment than the elementary student is capable of receiving. In carrying out this purpose formal courses in criticism are sometimes given. Other methods are also employed in the college for systematizing the material of literary scholarship. These attempts usually take the form of classifying the various monuments of the literature according to some ordered system. The simplest and most obvious method of classification is naturally that which is based upon chronology. It is generally assumed that a student should be acquainted with the historical sequence of at least the great figures in the development of English literature from Beowulf to Browning. Even though the student's background of historical knowledge is not sufficient to enable him to see that the writer of any particular period is the inevitable child of his own age, the chronological classification serves a useful purpose as providing a convenient framework which the student can complete with the fuller knowledge which gradually accumulates and which alone can give him any adequate realization of historical background and perspective.

In the same way attempts are often made to classify the mass of literary material under the heading of types. General-survey courses are often given covering all the various types of English literature,—epic, romance, lyric, drama, essay, novel, etc.,—and, usually in the later years of the college course, special courses in the development of particular types. This method of classification manifestly presents more difficulties than a simple chronological classification, although in compensation it may be assumed to have much greater value in bringing the student into a more intimate acquaintance with the actual content of literature and the methods of literary workmanship. The classification of literature according to types or genres, however, is obviously a method of abstract generalization based upon historical data which is apt to lead the student into a mistaken notion of types as established by some immutable dogmatic decree, of a fixed inherent nature, of which the various representations of the types are but individual exemplifications. It is plainly the teacher's duty to correct this tendency toward an "academic" attitude in the study of literature, and to prevent the system of classification, whatever it may be, from obscuring the student's vision of the actual processes of literary composition.

Still a third method of classification and of historical explanation of literature employed in college instruction is that which endeavors to study so-called developments and movements in literature. As a matter of fact, in the study of English literature, the movements are usually limited to two, or at most three.

The older periods, the Old English before the Conquest, the Middle English, centering about Chaucer, and the Elizabethan, centering about Shakespeare, are considered as periods mainly from the chronological point of view alone, although sometimes the Elizabethan period is treated comparatively in connection with a larger European movement, the Renaissance. More frequently, however, the study of movements in college classes in literature is limited to the study of classicism as represented in the eighteenth century, and of romanticism, as exemplified in the writings of Wordsworth and his contemporaries. The attempt to classify English literature according to movements seldom goes further than this, and after the discussion of the romantic writers, a return is usually made to the chronological method in the study of the writers of the Victorian Period. It may be questioned whether a more analytical treatment of movements of English literature is advisable or practicable. Perhaps the reason why further analysis has not generally commended itself is to be found in the fact that English literature throughout its history has not fallen into such clearly defined and conscious movements and schools as other literatures, notably the French, have done.

The question of the relation of the study of literature to creative literary composition, although it seems to be frequently disregarded, is one that the college teacher of literature is legitimately bound to consider. It is, however, in many instances, modestly assumed on the part of teachers that their function is purely interpretative, and that any bent toward literary expression which the student may have, being part of his natural inheritance and gift, must be allowed to work out its own destiny. The most the teacher can do, it is urged, is to acquaint the student with such technical details as the practitioners of the art of literature in the past have shown to be obviously useful, for example, the elements of versification in the writing of poetry, and after that to lend as sympathetic an ear to the productions of the student as the wisdom or charity of the instructor will permit. Many teachers, however, go further than this, and distinctly discourage efforts at original composition on the part of their students, on the ground that very few of them have the literary gift, that it is harmful to them to be supported in the delusions of literary aspiration to which they are by nature inclined, and that if a student has a genuine gift, discouragement and opposition will not destroy it, but rather strengthen it. Such a defense as this, however, is perhaps based upon too absolute a conception of what constitutes literature. From the psychological point of view it certainly seems unjustifiable that a student's mind should be kept in the receptive and appreciative attitude throughout his whole consideration of a subject, especially since he has in his command over language,

developed by natural use to a relatively high degree, the materials for the exercise of creative activity in the subject which he is studying. It would seem, therefore, that the teacher who discourages literary productivity on the part of his students merely evades the difficulties of the situation, and that the really helpful teacher will encourage creative activity at the same time that he guards the student from self-delusion and conceit. On the other hand, as a result of the increased commercial value of certain kinds of literature to-day, there are evidences of a tendency on the part of some college instructors to place great stress on the teaching of a practical technique of literature, of a sophistical art, such as Gorgias defended, which the student shall be able to put into practice with the hope of immediate pecuniary profit. Courses are thus given in short-story writing, in the novel, in the drama, and in various other kinds of writing for which there is at present a heavy commercial demand. So far as these courses really pretend to teach the art of writing short stories or plays, they fall obviously under the head of technical rather than liberal training, and aside from their immediate practical value would seem to have little justification as courses in the study of English literature. (See COMPOSITION.)

English Literature in the University — In German and American universities English literature occupies a definite and recognized position among graduate studies leading to the doctor's degree. In Germany courses in literature for advanced students have usually been given by the professor of English philology (*q.v.*), and until recent years have been mainly concerned with the earlier periods, in the investigation of which the study of language naturally plays a large part. But the modern periods are also being studied now in Germany from Shakespeare to Kipling, and a contemporary generation of scholars who give their attention almost exclusively to literature as distinguished from linguistics is becoming increasingly active. It is interesting to observe also that a number of elaborate and in some cases important literary studies have been published within the last decade by students of English literature in the French universities. In American universities literary courses form an important part of the graduate curriculum, and in the larger universities the faculty always numbers one or more professors whose entire attention is directed to questions in this field. A comparison of the subjects of doctoral dissertations in America, issued between the years 1880 and 1895, with those for the years 1895 to the present time, shows a marked increase of interest in what might be called specifically literary subjects. In England, on the other hand, although English literary scholarship has by no means languished at the universities, the formal organization of courses for literary research and investigation is of very recent date, and

these universities are consequently better known to the world at large through the publications of their distinguished faculties than through the activities of a body of disciplined students.

The methods and the purpose of the graduate study of English literature are many and various. The large proportion of students in graduate courses who intend to enter the profession of teaching unavoidably gives direction to a certain extent to graduate instruction. It is assumed, at least in American universities, that one important function of the graduate school is to provide students who enter the school with such further discipline and information as will enable them to present more adequately the subject of English literature to college classes. This end is not accomplished, however, by specifically pedagogical instruction, though logically it would seem that, if there is a place in colleges for teachers for the instruction which is usually given the methods of teaching literature in the elementary and secondary schools, there should also be a place for similar instruction for prospective college teachers. In many American universities there appears to be a partial tendency in this direction in the treatment of courses intended for candidates for the degree of Master of Arts, which are regarded not primarily as research courses, but rather as preparatory courses for teachers, or as preliminary preparation for students who expect to proceed to the doctor's degree. There results consequently a practically existent, if not theoretically accepted, distinction in the kinds of work required of candidates for the two higher degrees. The courses intended for candidates for the doctorate differ from the master's courses both in requiring a more extensive preparation and in an added stress on the side of investigation and production.

As is to be expected, the subjects covered by advanced graduate courses in English literature are largely such as come under the general head of English scholarship. Among them may be noted such subjects as have to do with the dating, the authorship, or the attendant circumstances of composition of a particular work or group of works. It will be observed that the term "literary" is broadly interpreted, and that often such topics lead into what might better be called literary antiquarianism, as when a monument, in itself apparently insignificant and unimportant, is resuscitated merely to serve as an exhibition of the life of a past period, or when the biography of an author, or the literary gossip of his day, is examined apart from any connection which they may have with specific writings. Many of the topics undertaken by advanced students of English literature likewise connect closely with questions of economic and social development. The borrowings of one author from another, as well as less direct sources and influences, are diligently examined, a method of investigation which

naturally leads over to the comparative study of literature (*q.v.*). It will be seen, therefore, that the study of the history of literature, as this subject is treated in graduate instruction, is very broadly conceived, ranging from the determination of simple questions of chronology and the details of antiquarian scholarship to the study of large national and international movements of thought. The study of sources and of comparative relationships, especially in the literature of the earlier periods, also connects intimately with such questions of primitive origins and beliefs as fall strictly under the head of folklore (*q.v.*). The origin and development of types or genres, as for example the ballad, pastoral, or drama, are also frequently subjects of graduate instruction and investigation, as well as the consideration of more specific features in a type, such as the monologue in drama, or the refrain in ballad. The number of questions similar to these which may be made the subject of graduate investigation is manifestly unlimited, and the value of such investigations in clearing away uncertain or disputed matters of literary scholarship can hardly be questioned. On the other hand, perhaps it is only fair to say that the modern graduate study of English literature, partly because of the demand for scientific method, is exposed to the danger of resting content with an arid Alexandrian scholarship which may obscure the student's view of what he rightly regards as the chief value of literature, its power of inspiring and pleasing. In default of any definite and substantial knowledge of the psychology of aesthetics, a knowledge which the literary student can hardly be expected to furnish to the world, one whole side of the study of literature, except to some extent from the historical point of view, is largely neglected in the graduate school, and that is the side of literary criticism. Moreover, in the graduate school even more than in the college, there are evidences of a disinclination to encourage or in any way to take account of original imaginative composition. The graduate study of English literature, as is quite obvious, is still strongly under the influence of the methods of study employed in the natural sciences; and as the botanist does not invent the plant to analyze, so the student of English literature need concern himself, as the botanist does, only with the data furnished him. But there is certainly a false parallelism here, and the conception of the university study of literature should be broad enough to include the man of constructive, imaginative temperament as well as the one of analytic and scientific bent of mind.

Although for the purpose of this survey the graduate study of English literature has been detached from other branches of English study, in the actual practice and organization of graduate schools no such clear separation is made. Students who are candidates for a higher degree

are not entered as candidates for a degree in English literature or English language specifically, but merely as candidates for a degree in English. It is assumed that graduate students will have a comprehensive interest in the whole subject, and students whose inclinations are mainly in the direction of literary studies are required to take a certain amount of work in the English language, just as students specializing in linguistics are required to take some courses in English literature. In the administration of details there is naturally considerable divergence among the various universities. At some places all students, whether their special work is in language or literature, are required to take courses in Gothic and Old French, besides courses which deal more directly with the history of the English language. At others, students who intend to devote their time primarily to literature are not required to take Gothic and Old French. It is manifestly contrary to the spirit of graduate study to impose a rigid curriculum upon all students, and the effort is usually made to adapt the formal work of students to their individual needs and abilities. In the administration of final tests and examinations, the greatest variety is to be found in the practice of the different universities, such questions being frequently left to the discretion of the individual departments. In the German universities and in some of the American universities no examinations are held until the candidate is ready to stand for his finals, preliminary to the awarding of the degree, at which time the examination is not on specific courses, but on the subject in general. But sometimes in the American universities course examinations as well as final examinations are held, and the requirement is made that students shall do "distinguished" work in their courses before they shall be permitted to proceed in their candidacy for a degree. This applies especially to the candidates for the master's degree, which is sometimes awarded, as at Harvard University, for work of a certain grade in a specified number and grouping of courses. Sometimes, however, as in the English department at Columbia University, in addition to the work in courses, the candidate for the master's degree is required to present an essay which shall embody the results of a thorough investigation of some subject carried on in connection with one of his courses. Candidates for the doctor's degree, on the other hand, are always required to present a dissertation or thesis, which shall give evidence of ability to carry out investigations with scholarly method, and which also contributes in some degree to the knowledge of the subject which the writer undertakes to investigate. In the German universities this dissertation must always be printed and accessible to the public before the degree is conferred; in some of the American universities, as at Columbia, Johns Hopkins, and others, a

similar regulation is enforced; but at others, for example, Harvard University, the candidate is not required to print and publish his doctor's dissertation.

LIVERPOOL UNIVERSITY, LIVERPOOL,

ENGLAND. — One of the recently established English universities, founded in 1881, as the University College of Liverpool, and opened in the following year with chairs in the general arts and science subjects. The relations between the local city government and the university were strong from the beginning. In 1882 the city council purchased lands and buildings for the college. In 1883-1884 money was raised to put the college on a university basis, and the Royal Infirmary School of Medicine became a part of University College. Hitherto the students were presented for degrees before such bodies as held external examinations. In 1884 the University College

became a constituent part of the Victoria University, of which Owens College, Manchester, and Yorkshire College, Leeds, were the other members. From this period on remarkable progress was made, due to the generosity and local interest in the welfare of the institution. Fellowships and scholarships were endowed; laboratories were provided and equipped in different departments; an athletic field was presented, 1891-1892; new building plans were entered upon in 1887-1888; the library was extended in 1893-1894. In 1895-1896 the first principal, Mr G. H. Rendall, retired and was succeeded by Mr. R. T. Glazebrook. In 1897 a school of commerce and a school of hygiene were established. In 1898 the school of tropical medicine, and in 1898-1899 a professorship of education, were added. In 1899 Mr. Glazebrook was succeeded by Mr. A. W. W. Dale, the present Vice-Chancellor. With the opening of the new century an active movement was set on foot to separate from the Victoria University and to establish an independent University of Liverpool. The plans met with remarkable enthusiasm among the citizens; money was quickly raised; the city council and other local bodies came to the active assistance, and in 1903 a charter was obtained to establish the university. Since that time the institution has made great progress, and while the other neighboring universities are developing mainly, perhaps, along scientific lines, Liverpool has continued to strengthen its arts faculty and to develop on the cultural side. The following departments may be mentioned: Celtic (with which Professor Kuno Meyer was until recently connected); paleography and diplomatics; social anthropology; ethnology; archaeology (classical and medieval); civic design, town planning, etc.; local history and records; school of social science and of training for social work. The total number of faculties is five: arts, science, law, engineering, and medicine (including hygiene, dental surgery, pharmacy, veterinary medicine and surgery, and tropical medicine). There are also a department of education and a university training college. Affiliated with the university are St. Aidan's College, Birkenhead, Edge Hill Training College, and Mount Pleasant Training College. A strong department of University Extension, providing general lectures to the public, and also instruction of a specialized character, is conducted by the Society for University Extension in Liverpool and District. In connection with the courses in this work traveling libraries are issued. The government of the university is in the hands of the Court; the University Council is the executive body; the Senate regulates the academic work; and Convocation is the body representing the graduates of the university. The University is maintained by endowments, grants from the Treasury, city council, and other local bodies, fees, etc. There is an active student

life, which centers round the Guild of Undergraduates and numerous sectional societies and clubs. The instructing staff in 1911-1912 numbered 219, and the student enrollment was 1078 in day classes and 274 in evening classes.

LYOYD, RICHARD (1595-1659). — A royalist clergyman and master of a private school at Oxford. He matriculated at Oxford from Oriel College and commenced B.D. in 1628. As a writer on education Lloyd shows distinct merit in his long-titled work in one volume: (1) *The Schoole-Masters Auxiliaries To remove the Barbarians Siege from Athens; Advanced under two Guides. The first, leading by Rule and Reason to read and write English dexterously. The second, asserting the Latine Tongue in Prose and Verse to its just Inlargement, Splendor and Elegancy.* (London, 1654.) (2) *Artis Poeticae, Musarum Candidatus Addiscenda, formula recens et dilucida* (1653.) Lloyd takes great pains over the letters. He takes pains also in showing the power of letters, e.g. "a the deaf man's answer, b that doth make the honey," and so on. He pays attention to anomalies in English spelling, and suggests rules for right spelling. He advocates short lessons, slow and sure progress, care in the beginning of a subject; he requires scholars themselves to communicate knowledge to their fellows, from which masters may themselves gather hints; he treats of emulation, retribution by way of encouragement and by way of discouragement. He deals with recreation, the correction of evil manners, and the removal of truants. His rules of art in writing are one of the best accounts of the teaching of writing in schools at the time. The first part of the book, teaching to read and write English dexterously, occupies 54 pages; the Latin grammar which follows contains 153 pages; and the *Artis poetica formula*, 64 pages. Another edition of the *Schoole-Masters Auxiliaries* was published in 1659. F. W.

LISBON, UNIVERSITY OF.—See PORTUGAL, EDUCATION IN.

LOBACHEVSKI, NICOLÁI IVÁNOVICH. — A Russian mathematician born at Nijni Novgorod in 1793, died at Kasan in 1856. He was one of the first to consider the essential nature of the celebrated fifth postulate of Euclid, which states (in substance) that through a given point only one line can be drawn parallel to a given line. He showed that it is possible to create a geometry, perfectly scien-

tific in itself, in which this postulate is denied. This gave rise to one of the group of non-Euclidean geometries. (See PARALLEL LINES.) Lobachevski published several works and memoirs on geometry and astronomy. His theory of parallels has not influenced the elementary treatment of geometry, and with the present tendency to make the subject less speculative it is not liable to do so. It has had great influence, however, upon the study of higher mathematics. D. E. S.

LOCAL EXAMINATIONS, ENGLAND.

— See EXAMINATIONS; LEAVING CERTIFICATES.

LOCAL SIGN. — Lotze called attention to the fact that every point on the skin when stimulated gives rise to a tactual sensation which has, in addition to its major quality, a peculiar characteristic, due to the point of application of the stimulus. Thus, the same stimulus when applied to the palm of the hand and to the back of the hand, gives rise to sensations which are alike in general quality. In the two cases, however, there is a slight qualitative character due to the point of application. This difference due to the point of application is known as the local sign. It is important in the development of ideas of tactual space, such ideas depending primarily on the systematic arrangement of local signs in series. The local signs of the retina have been described very fully by Wundt. It is a well-known fact that the same color stimulus applied to the center of the retina and to the periphery will produce qualitatively different sensations. In general, the external portions of the retina are color-blind, and especially sensitive to changes in brightness. In recognizing colored surfaces these qualitative differences are not recognized as differences in color, but as differences in space. The surface is seen as uniform in color and extended. The qualitative differences are thus converted into the percept of extension. Such an interpretation of qualitative differences into spatial characteristics is full justification for Lotze's description of local signs. C. H. J.

LOCALIZATION OF FUNCTIONS. —

See NERVOUS SYSTEM.

LOCATION, SENSE OF. — The ability to recognize directions reaches a very high state of development in certain animals, and in certain human beings, especially those who are deprived of the sense of sight. Hence, it has been regarded as a separate sense. Experiments with rats that have been deprived of their senses seem to indicate that these

animals at least are guided in their movements by a general recognition of direction which is probably muscular in type. That is, they acquire a certain set of muscular adjustments, and are guided by these adjustments. Certain animals, such as carrier pigeons, may make use of the semicircular canals (see STATIC SENSE) which from their structure seem suited to indicate changes in direction. The blind probably cultivate a high degree of attention to their muscle sensations, and also to the minor indications of position through the sense of touch which normal persons neglect.

The general psychological problem of the recognition of location is discussed under the topic "space perception," where it is shown that space-perception is not due to the activity of a single sense, but to the perceptual fusion of many sensations. C. H. J.

See SPACE, PSYCHOLOGY OF.

LOCATUS — A term denoting the assistant teacher or usher in the schools of the Middle Ages. The word was formerly derived from the Latin *locare*, to hire; this term was, however, not used of teachers, and the word *locatores* is found by the side of *locati* in some ordinances. It seems, therefore, probable that the term denoted master or teacher of a section or division, *locus*, *loca*, *Lokatien*. (See *Monumenta Germanæ Pædagogica*, Vol. I, p. xliii.) The *locati* were usually recruited from among wandering students or bacchants (*qv*), or the older pupils of a school. They were engaged and were dependent on the Rector, who was himself engaged in town schools by the town council. As may be expected, in most cases the *locati* were as shiftless and unreliable as most of the members of their class. Some, however, seized the opportunities afforded by their engagement to study. Only in rare cases did they hold their positions for longer than a year.

LOCI. — If a point in a plane is subjected to a single condition, it may occupy an infinite number of positions which follow one another in general in a continuous manner; and in this case their aggregate (*ensemble*) constitutes the geometric locus of points satisfying this condition, to the exclusion of all points which do not satisfy it. For example, if the condition is that a point in a plane shall be two inches from a fixed point of the plane, the locus is evidently a circle (circumference). Similarly we may have loci in space of three dimensions, a locus in that case being in general a surface.

As an educational matter the question arises as to when the subject of loci should be introduced into geometry, and how far it should be carried. There have been and still are those

who wish to introduce it early, and there are others who wish to treat it very extensively.

In general, however, it has been recognized that the subject is one of relatively recent development in the history of geometry, and that it requires relatively greater powers of abstraction than the study of the other fundamental concepts of the subject, such as the congruence of triangles. On this account it is generally placed not earlier than the end of the first book of a geometry arranged on the Euclidean model. While it is a very extensive subject, it is felt that it does not lead to the definite and usable results that characterize the geometry that has been inherited from Euclid and Legendre, and that therefore the place for elaborate treatment is in the general literature that a mathematician should study rather than in a textbook on the elements. When the student reaches analytic geometry (*q.v.*), he necessarily takes up an extended treatment of the subject, since conics are usually studied at present as loci instead of as sections of a cone. D. E. S.

LOCKE, JOHN (1632-1704). —Locke came of Puritan parents and through his long life was associated with the influences making for liberality and tolerance in matters of opinion and action. After six years in Westminster School, he entered Oxford in 1652. His original inclination seems to have been toward the Church, but this he abandoned on account of his growing sympathy with free inquiry and his interest in experimental studies. After a year spent as secretary to Sir Walter Vane on a mission to the Elector of Brandenburg, Locke returned to Oxford in 1666 and studied medicine, but did not take a degree. His studies, however, laid the foundation for his friendship with Boyle (*q.v.*) and Sydenham and stimulated his interests in the experimental method of research. In 1667 he became associated with the family of Lord Ashley, afterward the Earl of Shaftesbury. Here he acted as physician, confidential adviser, and tutor. The connection afforded him opportunities to exercise his political skill and secured for him several important posts. He was involved, however, in the fall of Shaftesbury and escaped to Holland in 1683 where he remained for six years. After 1691 he resided in the family of Sir Francis Masham at Oates in Essex, where he ended his days in the enjoyment of generous friendship and public esteem.

The complete list of Locke's writings is as follows: *Letters concerning Toleration*, 1689, 1690, 1692, 1706 (posthumous); *Two Treatises on Government*, 1690; *Essay concerning Human Understanding*, 1690; *Some Thoughts concerning Education*, 1693; *The Reasonableness of Christianity*, 1697; *Conduct of the Understanding*, 1706 (posthumous); *Some Thoughts concerning Reading and Study for a Gentleman*, 1706; *Instructions for the Conduct of a Young*

Gentleman, 1706; *Of Study*, published in *L. King's Life of Locke*, 1830; the plan for *Working Schools* may be found in H. R. Fox-Bourne's *Life of John Locke*, Vol. II, pp. 377-390.

Locke's chief distinction is as a contributor to philosophy. His *Essay concerning Human Understanding* is one of the significant books in the development of modern thought. In it the philosophy of empiricism receives its first important and thoroughgoing statement. In method and results it was revolutionary. It proposed an inquiry "into the originals, certainty, and extent of human knowledge, together with the grounds and degrees of belief, opinion, and assent" with a view to discovering "how far the understanding can extend its view, how far it has faculties to attain certainty, and in what cases it can only judge and guess," in order that "we may learn to content ourselves with what is attainable by us in this state" (Bk. I, Ch. 1, 4). This inquiry was not to be based on assumed principles but principles supposed to be innate or the natural possession of the mind. It was to proceed rather under the supposition that all knowledge whatsoever is acquired by experience, experience of the outer world through the senses and of the inner world of mind through reflection on what the senses offer. Knowledge was to be viewed as an individual acquisition and to be tested and estimated through the consideration of the way that knowledge is acquired. Thus the genetic, or as Locke calls it, the "historical, plain," method of viewing experience was given its first important formulation.

The results of the inquiry were no less significant than the method. Since, according to Locke, the senses mediate between us and the world, all our knowledge finds its originals in the ideas the senses give us and is conversant about nothing else. All that we can do is to reflect on these ideas, compare them, distinguish them, and combine them. Knowledge is thus limited to the extent of the ideas we have and to the discoverable relations between them. It extends no farther and can never carry us beyond the limits set by the genetic character of experience. Yet, even so, knowledge, if we mean absolutely certain knowledge, is inadequate for the concerns of life. It must be supplemented by judgment or belief whereby we entertain probable convictions for our guidance in a world which we can know only imperfectly. In all matters of probability our judgment is influenced by the conformity of our convictions with our experience or by the testimony of the experience of others. These ideas are developed in the *Essay* with a wealth of detail and suggestion which have made the book a classic in philosophical literature.

A GROUP OF EDUCATIONAL REFORMERS.

tion in general, but only with the education of a "young gentleman," was not the result of any extended experience as an educator. It contains rather the reflections of a keen observer and is influenced as much by Locke's philosophy as by his experience and observation. In a chapter of the *Essay, Of the Improvement of Our Knowledge* he writes: "I think I may conclude, that morality is the proper science and business of mankind in general (who are both concerned and fitted to search out their *sum-sum bonum*) as several arts, conversant about several parts of nature, are the lot and private talent of particular men, for the common use of human life, and their own particular subsistence in this world" (Bk. 4, Ch. 12, 11). Similarly in the *Thoughts* he says that he places virtue first and most necessary among the endowments that belong to a man or a gentleman (Sec. 135). This idea, that "we are fitted for moral knowledge and natural improvements" but not for "an universal or perfect comprehension of whatever is," is the dominant idea. "The candle that is set up in us shines bright enough for all our purposes" "Our business here is not to know all things but those which concern our conduct." It is, therefore, natural to find that Locke regards the business of a tutor to be not so much to teach his pupil "all that is knowable, as to raise in him a love and esteem of knowledge; and to put him in the right way of knowing and improving himself when he has a mind to it" (Sec. 195). Thus, emphasis falls on the formation of useful habits rather than on the acquisition of knowledge. This emphasis is reinforced by Locke's conviction repeatedly expressed that while a few men attain excellence by virtue of their natural endowments, most men, nine out of ten, are what they are by virtue of their education, that is, by virtue of the training and discipline they have received. Furthermore, education appears powerless to alter the natural capacity or "original tempers." It may mend them a little and turn them to account and use.

It is such ideas that Locke carries through in his program for the education of a gentleman. First, a sound basis should be laid by training him as a child in healthful habits of cleanliness, exercise, eating, and sleep. Children should be hardened by robust treatment and not softened by delicacies and refinements. Yet they should not be harshly managed. Severe punishments and especially "beating" should be reserved for obstinate disobedience and untruthfulness. To health are to be added "virtue, wisdom, breeding, and learning." Virtue is placed first. "This is the main point, and this being provided for, learning may be had into the bargain, and that, as I think, at a very easy rate, by methods that may be thought on" (Sec. 147). These methods are epitomized in the following passage from *The Conduct of the Understanding* (Sec. 6). "The faculties

of our souls are improved and made useful to us, just after the same manner as our bodies are. Would you have a man write or paint, dance or fence well, or perform any other manual operation dexterously and with ease, let him have never so much vigor and activity, suppleness and address, naturally, yet nobody expects this from him unless he has been used to it, and has employed time and pains in fashioning and forming his hand or outward parts to these motions. Just so it is in the mind: would you have a man reason well, you must use him to it betimes; exercise his mind in observing the connection of ideas, and following them in train. Nothing does this better than mathematics, which therefore I think should be taught all those who have the time and opportunity, not so much to make them mathematicians, as to make them reasonable creatures." It is well also that the young gentleman should learn a trade, "a manual trade; nay, two or three, but one more particularly" and not so much for the trade's sake as for useful diversion in his leisure hours. Throughout the whole work there is repeated counsel to consult the interests, taste, inclination, and capacity of those who are taught, to treat them with consideration and kindness, and to make their education more of a natural enjoyment than an unwelcome task. Yet the principal ideas are the training and discipline of man's natural powers through the formation of proper habits, rather than through the acquisition of knowledge; and the insistence that man is fitted by his faculties for a life of moral usefulness rather than for a life of inquisitive research into all that is knowable.

As already noted, the *Thoughts* concerns primarily the education of a gentleman, and nearly all Locke's writing on education has the gentleman in mind. It is interesting, however, to discover that while holding the post of Commissioner of Trade and Plantations he drafted a scheme of "Working Schools" for the children of paupers. The plan was prepared in order to relieve the burden of maintaining poor families at public cost, but was never put into practice. J. E. W.

LOCKERS, SCHOOL. — See ARCHITECTURE, SCHOOL.

LOG COLLEGE. — A term frequently applied to institutions of higher learning erected on the frontier of American civilization during the eighteenth and early nineteenth centuries. Such institutions were usually of academic or secondary grade, but frequently developed into institutes of collegiate grade. The most notable of these was the institution founded by Reverend William Tenant, a Scotch Presbyterian divine, at Neshaming, near Philadelphia, Pa., in 1726. The school grew out of the instruction which Tenant gave his four sons. Opposition from the authorities of the Presbyterian Church sprang up, when Tenant and his four sons became adherents of Whitefield and the "New Lights" movement. While the "Log College" ceased to exist at Tenant's death (1746), the controversy which he initiated and his sons carried on resulted ultimately in the founding of Princeton University (*q.v.*).

LOGARITHM — The common logarithm of a number is the exponent by which 10 is affected to produce the number. Thus $10^2 = 100$, hence the logarithm of 100 is 2. Similarly, $10^{0.30103} = 2$, approximately, hence the logarithm of 2, to five decimal places, is 0.30103. We indicate these relations by the following symbolism: $\log 100 = 2$, $\log 2 = 0.30103$. In these cases we have taken 10 as the fixed number to be affected by the exponent, but we might take other numbers, and in higher analysis it is more convenient to take a certain one which is represented by e , and which equals (to five decimal places) 2.71828. In general, therefore, the logarithm of a number is the exponent by which a certain number (called the *base* of the system of logarithms) is affected to produce the number.

Use of Logarithms. — Logarithms are designed to aid in numerical calculation. Since $10^a \cdot 10^b = 10^{a+b}$, we see that the logarithm of a product is equal to the sum of the logarithms of the factors. This is evidently true if we take another base than 10, since $e^a \cdot e^b = e^{a+b}$, and so for any other number than e . Likewise we have $10^a \div 10^b = 10^{a-b}$, and $(10a)^b = 10^{ab}$. Hence if we have a table giving the logarithms of numbers, and the numbers corresponding to the various logarithms (the antilogarithms, as they are called), we can reduce the operation of multiplication to that of addition, division to that of subtraction, raising to powers to that of multiplication, and extracting of roots to that of division. In engineering work, and indeed wherever extensive computation is needed, logarithms are an important aid. The increase in numerical tables of late years, the remarkable development of the calculating machine, and the improvements in graphic methods, have tended to restrict the use of logarithms somewhat.

History of Logarithms. — The exponential relation which first suggested logarithms was doubtless $a^n \cdot a^m = a^{n+m}$, a relation known as far back as the time of Archimedes (*q.v.*). By the end of the fifteenth century it was recognized that, in a series like 2, 4, 8, 16, 32, . . . the product of the second and third terms is the fifth ($2+3=5$). Chuquet (1484) speaks of it, and says, in his quaint French: "En ceste consideration est manifeste ung segret qui est es nomvres porporcionalz." The principle is more clearly stated by Stifel (1544), but it had already appeared in print in such works as those of Lichthovius (1510), Grammaticus (1518), Rudolff (1526), and Gemma Frisius (1540). After Stifel's work appeared, the significance of the principle, as he elaborated it, was noted by several writers, including Tartaglia, Ramus, Schonerus, Suevas, Clavius, and Peletier. Thus the fundamental principle was known long before the need for logarithms led to their final realization. It was the great development of trigonometry, beginning with Regiomontanus in the fifteenth century, that created the demand that brought about the invention. The necessity for handling the large numbers found in the series of natural functions rendered some improvement in calculation necessary, and it was this need that developed the new system.

It is possible that the first idea of a tabular arrangement may have occurred to Jost Bürgi (Justus Byrgius), a Swiss mathematician. At least we infer this from a statement made by Kepler in 1627. He constructed what was essentially a table of antilogarithms, which was published some years after John Napier issued his *Mirifici Logarithmorum Canonis Descriptio* (Edinburgh, 1614). The first mathematician to recognize the great value of Napier's invention was Henry Briggs, later Savilian professor of Geometry at Oxford. He visited

Napier in 1615, and suggested the practical value of 10 as a base of a system of logarithms. Napier had not used this base, nor had he used the base of the so-called hyperbolic (natural, Napierian) logarithms, which were invented by John Speidell (*New Logarithmes*, London, 1619). The logarithms of Napier are connected with the latter by the relation

$$\log_e a = 10^a \cdot \log_e 10^a - 10^a \cdot \log_e e,$$

where $\log_e a$ is the logarithm of a in his system, and e is the base of the system invented by Speidell.

Logarithms immediately attracted wide attention. Vlacq published some extensive tables at Gouda in 1628; and these were reprinted in England in 1631. Faulhaber printed some tables at Frankfurt, in his work on engineering, in 1630; and by 1646 the subject had found a place in a prominent English arithmetic (Hartwell's edition of *Recorde's Ground of Artes*).

Logarithms in the School. — The practical use of logarithms is easily taught, and from the standpoint of difficulty there is no reason why it should not enter into the curriculum of the elementary school. There is, however, the question of the need for the subject that may be felt by the student. Logarithms are means to rapid approximate calculation; they are indispensable to successful work in trigonometry and its applications, and they are helpful in the practical computations of mechanics and engineering. They are not, however, practically used in ordinary business life, and the fact that they require a table renders them unavailable for mere occasional computations. The pupil does not, therefore, experience a need for logarithms in the elementary school, at least as the subjects are arranged in the United States to-day. If computations in physics and mechanics should enter earlier in the American high school, the subject could easily be taught in the first year (the pupil's ninth school year), and with the growth of industrial classes this will probably come to be the case. For the high school course in mathematics leading to advanced work, however, there is at present no reason for thinking that the subject should be presented until the need is felt in trigonometry. Indeed, for the industrial classes the slide rule (see **MECHANICAL CALCULATION**) will probably take the place of logarithms to a large degree; although, being based upon the latter, these will need to be taught to some extent in any case.

D. E. S.

LOGIC. — The science (or art) of correct thinking. All schools of logicians would probably formally agree in this definition. It does not, however, imply anything concerning the nature of thinking, and hence nothing concerning the criterion of its correctness. Since modern philosophy has had for one of its chief points of debate the nature of thought, and the

relation of thought on one hand to existence and on the other hand to knowledge, the matter of the scope, limits, and purpose of logic have been thrown into the greatest uncertainty, not to say confusion. By a curious way, this result is largely the work of Kant, who himself proclaimed logic to be the one instance of a perfected and completed self-inclosed science. By logic he had in mind formal logic, or the logic of reasoning resting on the canons of identity, contradiction, and excluded middle; essentially as formulated by Aristotle. But Kant himself introduced the conception of a type of thinking which was not merely formal, but constitutive in some respects and regulative in others, and thus brought the nature of logic within the region of disputed questions in epistemology.

Antiquity — Logic was first recognized as a branch of the higher education at Athens in the period subsequent to Aristotle. The founding of the philosophical schools in the fourth century, and the "analytical" inquiries of Aristotle, afforded the preconditions; the one provided the earliest institutional teaching of academic rank, the other first gave to logic formal existence as a science. But it was in an altered and much simplified form that the logic of Aristotle finally became established — probably during the course of the second century — as one of the circle of studies (*ἐγκύκλια παιδεία*) which every liberally educated Greek might be presumed to know.

A long process of intellectual and educational differentiation, during which Greek philosophy reached and passed its zenith, issued in the gradual detachment of distinct disciplines. The separating out of logic from the common content exhibits recognizable stages: (a) An implicit logical discipline had lain embedded even in the ancient "music," which was esteemed by the Greeks and defended by Plato expressly on the ground of its value in organizing and regulating the mental life. (b) The fragmentary logical methods practiced, and probably to some extent formally taught, by the younger Eleatics, the Megarians, but above all by the sophists, rhetors, and by Socrates, provided instruction and exercise in logical argumentation, the educational effect of which, direct and indirect, was undoubtedly great. (c) Mainly through the instrumentality of Socrates and Plato, the sophistic movement of the fifth century clarified itself, issuing in the settled opposition of rhetoric and philosophy, which thereafter remained the staples of higher education down to the close of the Græco-Roman period. (d) Later, at the hands primarily of Aristotle, philosophy received articulation into the disciplines which have been permanently recognized. The position accorded to logic, that of a propædæutic to philosophy, on the ground that it deals only with the form or method of knowledge, was decisive in determining both its content as a science

and its status as a subject of instruction until well into the modern era. With the exception of the ontological implications of the work on the *Categories* and commentaries thereon, it consistently excluded metaphysical questions. Its instrumental character, moreover, cooperated with the internal relations of content to fix its position as one of the group of preparatory formal disciplines, later distinguished as the *trivium*. (c) With the post-Aristotelian subdivision of the whole of philosophy into logic, physics, and ethics, the content traditionally known in modern times as formal logic became a subordinate part of the first division under the name of dialectic. But the coincidence of formal logic and dialectic was not at first complete. For the Stoics, whose influence was paramount in further determining the form in which logic passed into education, first divided logic into rhetoric and dialectic, distinguished on purely external grounds as the arts of continuous discourse and of discussion, and then divided dialectic into the doctrines of thought, or meaning, and words (*in res, quae dicuntur, et vocabula, quibus dicuntur*, as Seneca expresses it). The former alone corresponds, roughly, with the formal logic of later times. Hence the dialectic of the Stoics included much which was later assigned to grammar. Formal logic never quite freed itself, however, from entanglement with questions of language, a fact for which Aristotle must share the responsibility, since in the *De interpretatione*, extensively used as a text in the Middle Ages, he fails clearly to distinguish between the thought or judgment and its expression in language. Further evidence of the dominant influence of the Stoics appears in their important contributions to the terminology of the science (including the name "logic"), in the permanent retention of a number of their distinctions and divisions, and in the instances of historical connection between the introduction of the study of dialectic and contact with Stoic philosophers or writings.

Two virtually opposed conceptions of the aims and scope of logic, which profoundly affected both its future development and its relation to education, were present in germ from the outset. On the one hand, Parmenides, in explicitly recognizing the distinction between knowledge and opinion, laid the foundation for the conception of logic as an objective science embracing the methods of attaining necessary truth; on the other, his follower, Zeno, in contenting himself with exhibiting the contradictions to which the tenets of their opponents led, inaugurated the treatment of logic as an instrument of controversy. Parmenides' principle that what can be thought can be, i.e. that truth and reality are to be determined by consistency or the necessary in thought, found further development in the Socratic discovery of the universal element in knowledge, forming the content of a defini-

tion, in Plato's principle that universal and necessary knowledge presupposes immutable being, and in Aristotle's formulation of the principles of theoretical demonstration (*ἀποδείξεις*); Zeno's employment of the principle of contradiction with a polemical aim led to the rise of the Megarians, to the forensic argumentation and sophistic dialectic of the sophists and rhetors, and to the rhetorical logic of later times.

The two conceptions are not as such mutually exclusive; the factual divergence arises from the supplanting of the theoretical by some practical aim; historically they have been on the whole antagonistic, and have tended to displace one another. Their nearly parallel development may be traced, as indicated, down to the decline of Greek thought in the Macedonian period, after which logic as an instrument of the disinterested determination of truth fell into abeyance until the revival of learning and the birth of the modern era. Aristotle marks the turning point. The culmination in him of the development of logic as an objective science was followed by its complete subservience to practical aims. For while the elder Peripatetics maintained the distinction between apodictic and dialectic, it proved to be barren, since they failed to grasp the distinctive character of logical thought; and, with the Stoics, who transmitted logic to the Graeco-Roman curriculum, even the distinction disappeared. In the *Organon* both conceptions receive their just dues. Apodictic (with syllogistic), the method of strict syllogistic demonstration proceeding from proved premisses or from self-evident first principles (*Prior* and *Posterior Analytics*), is fundamental, and is opposed to dialectic in all its forms. Yet dialectic as such is not to be rejected, but distinguished as legitimate and illegitimate; and to the former is assigned the place of a subsidiary art. In his *Sophist*, Aristotle credits Zeno with being the "inventor" of dialectic, meaning thereby "the art of arguing, not from true premisses, but from premisses admitted by the other side" (Burnet). Aristotle's own treatment of dialectic, in the *Topics* and elsewhere, is a comprehensive critical presentation exhibiting the historical progress. Properly, dialectic is an auxiliary logical method, viz. the critical examination of the truth of an opinion by means of discussion, involving the viewing of it from all sides; its insufficiency arises from its proceeding from merely probable premisses, or commonly accepted opinions, instead of from premisses which have been shown to be true; it therefore yields at the best only probable conclusions. Sharply distinguished from legitimate dialectic is the perverted or rhetorical dialectic which aims, not at discovery of the truth, but merely at victory over an opponent. Still further removed from the conduct of discussion for theoretical ends are the degenerate types of

dialectic known as (1) *eristic*, which is unduly contentious and satisfied with the mere semblance of victory, and (2) *sophistic*, which implies the deceptive use of logical forms, particularly of concealed fallacies, with a view to creating the false appearance of knowledge, for the sake either of reputation or of pecuniary gain.

With the decline in theoretical interests and in constructive power in the Hellenistic period, the prolonged conflict between philosophy and rhetoric, of which the opposition between apodictic and dialectic may be regarded as a principal phase (the incomplete differentiation is manifest, not without irony, in the claim of Isocrates, repeated later by Quintilian, that rhetoric is philosophy, as well as a complete education, and gives an adequate insight into human affairs; while Aristotle, by sharply distinguishing the two at the same time that he taught both, prepared the way for their definite separation), culminated so far as the Greek schools were concerned, leaving rhetorical logic and the individualistic systems of morals as the principal representatives of philosophy. The same dominance of practical aims which narrowed logic to the *ars disserendi* extolled by Cicero, favored the assembling of the constituent disciplines of "encyclical" or general education in compendious form. The lost work of Varro, *Disciplinarum libri novem*, which apparently epitomized the contents of the current Greek education, was the first encyclopedic work in Latin. Encyclical education, the precursor of the curriculum of the Seven Liberal Arts (*q v*), gradually established itself throughout the Græco-Roman world, including the pagan and Christian schools of Alexandria. By the time of Quintilian it more definitely attained the status of a propædæutic to professional study, whether of rhetoric, philosophy, medicine, or jurisprudence. Though the list of the liberal arts did not become finally fixed in premedieval times, logic in the form of dialectic usually appeared as one of the disciplines of the encyclical curriculum. Both Quintilian, in his account of *orbis ille doctrinæ*, and Seneca (*Ep.* 88) omit it by name. But they probably considered it as merged with rhetoric; if so, the fact is a significant commentary on the educational position of logic at the time.

The content of the dialectic of the Græco-Roman curriculum can be only conjecturally inferred, and with much uncertainty, from (1) the later Latin manuals, probably based to some extent on Greek models, and (2) the current logic of the philosophical schools, particularly that of the Stoa. It probably included the principal topics found in later formal logic, presented in the most elementary and formal manner. But it should be borne in mind that, while the constructive study of logic, so long as it continued, must always have been confined to the esoteric circle, large numbers of

students in all the universities of the Græco-Roman world, including, after c. 100 a.c., the whole body of the ephebes, attended less technical lectures, which, however, provided, certainly in many cases, a much more adequate treatment of logical doctrines than did the dialectic of the later preparatory curriculum.

Middle Ages.—When education passed into the custody of Christian institutions, the principal task, next to that of educational organization, was the appropriation and transmission of an already evolved educational content. In this process, dialectic, destined later to become the chief discipline of the trivium, was slightly broadened by the partial restoration of its Aristotelean form. Two modifications made by the Stoics, their treatment of the hypothetical syllogism as typical, and their reduction of the categories to four, failed to pass into the medieval tradition. On the other hand, the really important labors of Theophrastus and Eudemos in developing the theory of hypothetical and disjunctive syllogisms, bore permanent fruit. But this advance fell within the Aristotelean framework.

The definitive inclusion of dialectic in the curriculum of the Seven Liberal Arts insured it a permanent place in medieval education. Until the middle of the twelfth century, its content remained unaltered as fixed by a limited number of texts. The origin and scope of these texts may be briefly indicated: (a) A less widely known source of some importance was the spurious third book, attached to the *De dogmate Platonis* of Apuleius, a north African rhetorician of the second century, A.D., entitled *De philosophia rationalis*, which there is internal evidence to show was industriously consulted by Capella. It is a strange magna of Stoic and Peripatetic logic, the discussion includes categorical and hypothetical judgments, quantity and quality and parts of propositions, their opposition, conversion, and contraposition the predicables (the Aristotelean list), the three Figures of syllogism (the addition of the Fourth Figure was first ascribed to Galen, on the authority of Averroes, in the sixteenth century), the nineteen moods of Theophrastus, and indirect proof. (b) The influential *Introduction to the Categories of Aristotle* (*Éisagoge*) by Porphyry (232-304), a Neoplatonic commentator on Aristotle, should be assigned to the medieval texts, since its effect on education fell subsequent to its translation into Latin by Boethius. The elaborate discussion of the predicables (*quinque voces*), as tending to equate all logical procedure with division into points of view, added materially to the preponderance of the *Topics* and of the merely formal and dialectical character of early medieval logic. (c) The fragment, *Principia dialecticæ*, attributed to St. Augustine, which formed part of an unfinished encyclopedia of the liberal arts founded on Varro's *Disciplinæ* and begun in 387, was very

limited in content, and owed its vogue as a text mainly to the ecclesiastical prestige of its author. It defines logic as *scientia bene disputandi*, and contributed its share to the rhetorical tendencies of medieval logic. The pseudo-Augustinian text, *Categoriae decem ex Aristotele descriptae*, a contemporaneous work, was confined to a translation, paraphrase, and commentary. Its educational importance lies largely in the fact that Alcuin borrowed from it nearly one half of his dialogue on *Dialectic* (d). The most extensively used of medieval texts on logic, and often the only text used, was the *De dialectica*, forming the fourth book of the fantastic allegory of Martianus Capella, entitled the *Marriage of Mercury and Philology*. Written in northern Africa, c. 420, this was the first encyclopedia of the seven liberal arts which has been preserved entire. The plan of the work was taken from Varro, while its content was compiled from various sources, the part on dialectic being drawn mainly from Apulcius and Varro. It presents several additional features familiar in later formal logic: Definition, division, and partition; univocal and equivocal, categorematic and syncategorematic terms; the ten categories of Aristotle; categorical and conditional syllogisms, the former in nineteen moods, the latter in the hypothetical and disjunctive forms and moods. With the exception of fallacies, no chief part of early medieval logic is now wanting; and, as against the Stoics, there are the minor restorations of Aristotle already indicated. (e) Much the most prolific contributor to the stock of medieval texts on logic was Boethius (c. 480-524), "the last of the learned Romans," (Sandys) whose numerous translations and commentaries transmitted to the Middle Ages the *Organon* of Aristotle. Unfortunately the versions of the more important treatises, viz. the *Prior* and *Posterior Analytics*, the *Topics*, and the *Sophistici Elenchi*, remained unknown until about the middle of the twelfth century; while those which early passed into the service of the schools, because they had been provided with commentaries, viz. the versions of the *Categoriae*, the *De interpretatione*, and the *Eisagoge* of Porphyry, together with the corresponding commentaries, including that on the *Topica* of Cicero, and the original logical treatises of Boethius, all on the whole tended to accentuate the interest in merely formal distinctions rather than to broaden the scope of logical inquiry and instruction. There is one conspicuous exception. Porphyry, in the first paragraph of the *Eisagoge*, quite incidentally, he it remarked, raises the logico-metaphysical question respecting the real existence of genera and species which chanced to provoke the great medieval controversy between the realists and nominalists as to the nature of universals. (f) Cassiodorus (c. 485-c. 580), who, after serving the Ostrogothic dynasty thirty years, founded two monasteries and

devoted the remainder of his long life to Christianity and to the preservation of pagan learning, and Isidore (c. 570-636), Bishop of Seville, both produced encyclopedias of the seven liberal arts which greatly promoted the introduction of the classical disciplines into Christian education and further determined their early medieval form. One half of the *De artibus ac disciplinis liberalium litterarum* of Cassiodorus, written in 543-555, is devoted to dialectic; while the *De arte dialectica* of Isidore forms, with rhetoric, Book II of the *Origines* or *Etymologiae*, the first encyclopedia in the modern sense. Cassiodorus' *De dialectica* is a confused compilation, derived principally from Boethius, Apulcius, and Porphyry, but characterized by the prominence given to definition, the syllogism, and probable reasoning, i.e. to the parts of logic most serviceable in rhetorical argumentation. Isidore's treatise, which is mainly a patchwork of verbal reproductions from Cassiodorus, was largely responsible for transmitting to the medieval tradition the rhetorical elements in Cassiodorus which are not found in Capella.

The above body of texts in school logic, together with the dialogue *De dialectica* of Alcuin (c. 735-804), the pertinent chapter in the *De clericorum institutione* of Hrabanus Maurus (c. 776-856), and the German translations of Capella and Boethius by Notker Labeo (d. 1022) of the monastery of St. Gall, constituted throughout the early medieval centuries a relatively fixed apparatus for logical instruction.

From the middle of the sixth century to the rise of the universities in the twelfth and thirteenth centuries the monastic, cathedral, and college schools were in control of higher education. Throughout this period dialectic steadily rose in educational importance. Its utility in the defense of Christian doctrine was early manifest, and as the great problem of organizing the faith of the Church into a rational system pressed for solution and drew to itself all the intellectual energies of the time, logic became not merely indispensable, it was supreme. Thus a twofold characteristic of the position of dialectic in the Graeco-Roman period is repeated: it was now the instrument of theology, as it had been that of oratory; and now, as then, it was wholly enlisted in the service of practical aims, since it was devoted to the organization and defense of a fixed traditional content, rather than to a disinterested inquiry into a body of objective truth. It was natural that in a theological age the *artes sermonicales* of the trivium should be more highly esteemed than the *artes reales* of the quadrivium (a circumstance possibly not unconnected with the fact that Alcuin wrote on the trivium only); and within the trivium itself, while grammar long held undisputedly the first place, and rhetoric and dialectic contended for the second, later dialectic first definitely triumphed

over rhetoric, and then finally penetrated even grammar with its own principles, forcing upon it its terminology, and converting it into a speculative science (*littera sordescit, logica sola placet*, John of Salisbury). Accordingly, at leading monastic and cathedral schools, such as Paris, Tours, Rheims, Chartres, Fulda, Reichenau, and St. Gall, particularly after the intellectual awakening which began with the eleventh century, the study of logic, including disputation, was prosecuted with much zeal and enthusiasm, and claimed an ever-increasing allotment of time. After the rise of scholasticism, the leaders in the famous controversy over the substantial existence of universals, — Erigena, Roscellinus, St. Anselm, William of Champeaux, Abélard, Albert the Great, Thomas Aquinas, Duns Scotus, and Occam (*q.v.*) were *ipso facto* immersed in problems which were at once logical and metaphysical; yet on the whole the Aristotelian tradition which excluded logic from philosophy remained unshaken. Gerbert (c. 950–1003), master at Rheims and at Paris, and later elevated to the papal chair, and Gilbert de la Porrée (c. 1075–1154), chancellor at Chartres, are examples of celebrated teachers of logic whose logical writings (*De rationalis et ratione uli* and *De sex principis* respectively) exhibit the prevailing interest in the ontological implications of logical problems, and yet evidently are not designed to mark any departure from the time-honored separation of logic from philosophy. The latter work, in fact, was later frequently included in the earliest Latin editions of the *Organon*.

Coincident with the intellectual expansion of the twelfth century, and contributing largely to it, was the remarkable discovery, by the Western world, of the remaining works of Aristotle. The Venetian translation by Jacobus Clericus (1128) apparently did not at once become generally known. Adam du Petit-Pont discussed the *Prior Analytics* as early as 1132. But it was Theodoric of Chartres (whose *Heptateuchon*, completed in 1141, contained all the *Organon* except the *Posterior Analytics* and the second book of the *Prior Analytics*) who first introduced the long forgotten logical treatises into the schools. This we know on the authority of John of Salisbury (*Metaphysics*, 1159), who also explains that the *Posterior Analytics* were omitted because of their difficulty. It is clear that he was acquainted with the whole of the *Organon*. Gilbert cites the *Analytics* as generally known, while his pupil, Otto of Freising (*d.* 1158), introduced the recovered treatises into Germany, possibly in the Boethian versions. By the middle of the twelfth century, accordingly, the newly discovered and more important part of the *Organon*, consisting of the *Topics*, the *Prior* and *Posterior Analytics*, and the *Sophistici Elenchi*, had become widely known. Thereafter, for centuries, the two groups of

the logical treatises were distinguished as *nova logica* and *vetus logica*. And on the addition of the *Physics*, *Ethics*, and *Metaphysics*, about 1200, the “new Aristotle” was recognized. Latin translations from the Arabic (or Arabic through Syriac) versions of the Greek originals, which had found their way into Europe on the Moorish conquest of Spain, — translations which were produced by a college of translators at Toledo, and included also the extensive commentaries of Avicenna, Averroes, and others — were in the first half of the thirteenth century a very important although not pure source of further knowledge of the Aristotelian writings. Later Latin versions, made direct from the Greek, were rightly regarded by the great medieval Aristotelians as the more trustworthy.

It is not surprising that the effect produced upon the medieval mind of the twelfth and thirteenth centuries by the “new Aristotle” was almost startling. But the widening of the intellectual horizon, and the further stimulus given to the already over-subtle tendencies of thought, did not produce a change of attitude. Acquaintance with the Aristotelian apodictic, with the principles of theoretical demonstration and of the ultimate self-dependence of thought, resulted rather in merely adding to the resources of theological argument and in carrying to completion the scholastic edifice. The organization of education witnessed, however, one general effect of some consequence. Gradually, in addition to the traditional liberal arts, philosophy came to be recognized as providing a second stage in the preparatory training for theology.

The founding of the universities (*q.v.*) brought with it the apotheosis of logic. The curriculum of the faculty of arts, later called the faculty of philosophy, because of the commanding position occupied by logic and philosophy, was at the outset a continuation on a slightly higher plane of the arts curriculum of the monastic and cathedral schools. The comparative neglect of the *artes reales*, already noted, on the whole continued, notwithstanding the stirrings of a new scientific interest manifest in such sporadic phenomena as the appearance of a Roger Bacon in the thirteenth century; classical studies, despite the vigorous defense of the “authors” as against the arts at Chartres and Orleans (Henri d'Andeli, *Battle of the Seven Liberal Arts*; c. 1250), failed to gain a foothold; rhetoric languished, and grammar became dialecticized; the lion's share of the curriculum accordingly fell to logic and philosophy; and if we consider that the numerous minor Aristotelian treatises in natural philosophy were at that time regarded as a constituent part of philosophy coordinate with ethics and metaphysics, it would be hardly too much to say that, for the space of a century and a half following the triumph of Aristotle at Paris, as signalized by the uni-

versity statutes of 1254, logic and philosophy between them comprised nearly the whole of the arts curriculum at the northern universities. The time allotted to logic, including disputations (*q.v.*), apparently ranged at different universities and at different times from a maximum of about three quarters of the whole (University of Toulouse, time-table of 1309, exclusive of grammar: see Pactow) to a minimum of about one third (Leipzig, time-table of 1519. see Norton). The textbooks on logic prescribed in the various university statutes regularly included both the "new" and the "old" logic, the latter always embraced the *Eisagoge* of Porphyry, as well as the *Categorías* and *On Interpretation* of Aristotle, and frequently also the *Divisions* and *Topics* of Boethius, and the *Six Principles* of Gilbert de la Porrée. But the difficulty of these treatises for youths of fourteen called into existence a large number of adaptations and abridgments, by far the most celebrated of which was the *Summulae logicales* of Petrus Hispanus (*d.* 1277), now known not to have been a translation from the Greek of Psellus, but itself the original of the Greek *Synopsis*, etc., of Georgios Scholarios (1400-1464). This work reigned in the schools for two and a half centuries, and passed through innumerable editions. The first six tractates summarize the logical treatises of Aristotle and Boethius, *i.e.* the main body of logical doctrines known by the middle of the twelfth century, now designated as *logica antiqua*; whereas the seventh tractate, entitled *De terminorum proprietatibus* (*Parva Logica*), sets forth a group of modern additions, distinguished from the foregoing as *logica moderna*. The content of the *Parva Logica* offered a premonitory symptom of the coming excesses of scholastic thought. It presented a body of formal logical distinctions, semi-grammatical in character, and recalling vividly the Stoic doctrine of words (see above). When the prestige of Aristotle began to wane in the fourteenth century, logic yielded something of its position in the curriculum to other subjects; but the real loss lay in the incipient decadence, in the over-refinement of conceptual distinctions, the quibbling subtleties which later brought such discredit to the schoolmen. In the last phase of medieval logic, accordingly, *a priori* formalism divorced from the test of fact exhibited those excesses which led to the inevitable revolution.

Modern Era. — The modern era begins with the recovery of the self-dependence of thought. The new spirit manifested itself in the rejection of authority and tradition, in the free appropriation of the treasures of antiquity, in the new interest in nature, and in the search for knowledge by direct and disinterested inquiry. The share of logic in this movement was not primary, but a consequence of the new attitude in metaphysics and epistemology.

The result was none the less important; the way was opened to restore to logic the character of a theoretical science, and eventually to raise it to the position of a constituent part of philosophy itself. Yet these changes came but slowly, and, down to the eighteenth century, they were reflected in academic practice only after their consummation in the world of letters.

A distinction should be recognized between the more elementary instruction in formal logic, which has been provided for throughout the modern period in the curricula of the upper forms of higher schools (gymnasias, lycées, and colleges) as well as in universities; and the larger treatment of logical problems in advanced university courses. In the former the ancient and medieval traditions long maintained themselves without radical innovations; in the latter, the development of logical doctrines followed the main currents of modern philosophy in the rationalistic, empirical, and critical directions, but produced only an indirect and very limited effect upon instruction. It should also be remarked that the relative prominence of logic in the modern as compared with the medieval curriculum has been inevitably greatly reduced.

The first reforms were those attempted by humanists of the early Renaissance. Their attacks were directed against the summulist logic and in general against the scholastic Aristotle. The characteristic revival of classical authors assumed in their hands the form of a restoration of the Roman rhetorical logic. These features are variously exhibited by Valla (1407-1457), whose textbook, *Dialecticæ disputationes contra Aristotelicos*, first printed in 1499, is based on Cicero and Quintilian, and is at once a *scientia rationalis et sermonicalis*; by Agricola (1442-1485), who sought to attain from Aristotle's own writings a purer Aristotelianism, and whose rhetorical *De inventiōe dialectica*, drawn from Aristotle, Cicero, and Quintilian, was praised and laid under contribution by Melancthon; by Vives (1492-1540), a true modern, in whose *Pseudo-dialektiker* (1519) the sins of the scholastic logic are relentlessly exposed, and whose encyclopedic work, *De disciplinis* (1531), contains a strong plea for a purely formal logic freed from metaphysics and based on the nature of thought; by Ramus (1515-1572), the "Abelard of French humanism" (Ziegler), whose *Animadversiones in dialecticam Aristotelis* (1534) sought the reform of logic by taking, not the *Organon*, but the innate logic of the human mind, as the final authority, and whose *Institutiones dialecticæ* (1543), going back to the Ciceronian *ars disserendi*, merged logic with rhetoric, and introduced an order of topics long followed in the handbooks, *viz.* Pt. I, *De inventiōe*, treating of the concept and definition, and Pt. II, *De iudicio*, treating of judgment, syllogism, and method; by Melancthon

thon (1497-1560), who brought Luther to consent to a new Aristotle in education, who included the trivium in the Saxony School Plan for Latin schools (1528), which laid the foundation for the modern German gymnasium, and whose widely used compendia on logic (*int. al., De dialectica libri IV*, 1528; *Erotemata dialectices*, 1524) became the basis for many logical textbooks attempting to reconcile Aristotle with the Ramists and humanists. It was perhaps symptomatic of the general antagonism to Aristotle that Ramus' really unimportant attempt at a reform of logic enjoyed so great vogue. The Ramist stronghold was France, where a long and bitter conflict raged between the Ramists and Antiramists; but, favored by Johann Sturm (*q.v.*), whose carefully organized and historically influential Strassburg curriculum included dialectic in the two upper forms, Ramism spread into Germany; while among the evidences of its introduction into England are the traces of its influence on Milton's *Tractate on Education*. It was not finally displaced until superseded by Cartesianism.

The recovery of an objective logic, aiming solely at determining the truth, came in principle with Francis Bacon and Descartes. With the former, the emphasis is upon the control of thought by fact; with the latter, it is upon demonstration by the necessary implications of concepts. But the influence of neither upon instruction in logic was direct or immediate. Bacon's insistence upon observation of the actual course of nature, his contention that the syllogism could represent no more truth than the experiential knowledge contained in its component ideas, found expression in the realism of Ratke (*methodus nova*) and Comenius (*Great Didactic*, which provided for logic in the curriculum of the Latin schools); while his eloquent advocacy of the primacy of induction, and his services, following upon Roger Bacon, da Vinci, Telesius, Galilei, and others, in advancing the formulation of its principles, were a potent stimulus to the future development of inductive logic, and contributed in a quite incalculable degree to the promotion of its study. Descartes' own *Discours de la methode*, indeed, appeared in French secondary curricula after the opening of the eighteenth century; but of far greater importance for logic was the production by two Cartesians, Arnauld and Nicole, of the celebrated Port-Royal *La logique ou l'art de penser* (1662), which they based upon a tractate of Pascal. This skilfully written handbook, which found high favor in France for nearly a century and was translated into several foreign languages, combined Descartes' rules of method and views on knowledge with a simplified and modified Aristotelian logic.

Of considerable interest was the methodological effort made at this time to deduce the content of logic from fundamental principles, or,

at least, to organize its material under the laws of thought regarded as postulates. The first example is the Cartesian Geulinx, who sought (*Logica fundamentis*, etc., 1698) to construe logic by recognizing affirmation as its specific principle. Leibniz, as is well known, added to the principle of identity that of sufficient reason, declaring these to be the highest principles of knowledge. Later, Reimarus (*Vernunftlehre*, 1756) and Twisten (*Logik: Analytik*, 1825), among others, made systematic efforts to exhibit logic as the theory of the application of the principles of identity and contradiction to concept, judgment, and inference. The laws of thought have come to be regarded, in a sense not often adequately defined, as the supreme principles of formal logic.

The ontological or metaphysical logic of Kant and his successors, which for the first time since the Dialectic of Plato exalted logic to the position of the fundamental philosophical discipline, was limited in its effect upon instruction to the advanced university courses of the critical idealists and their followers, and to the remote but not unimportant neo-Hegelian movement at Oxford, from which issued Wallace's translation of *The Logic of Hegel*, Bradley's *Principles of Logic*, and Bosanquet's *Logic, or the Morphology of Knowledge*, works which, directly and indirectly, have exerted considerable influence upon the content of recent English and American university courses and textbooks.

The development of induction through Newton's *Regule* prefixed to the *Principia*, Herschel's *Discourse* (1832), Whewell's *Philosophy of the Inductive Sciences* (1840), Mill's *A System of Logic* (1843), and Jevon's *Principles of Science* (1874), led to another line of influence on academic instruction. Conceived on broader philosophical lines were the important and educationally influential works, all entitled *Logik*, of Lotze (1843), Sigwart (1873-1878), and Wundt (1880-1883), which combined with elaborate expositions of the methodology of scientific research a teleological idealism that sought to recover the historical form of the concept of evolution. Philosophically much less important, but serving as the model for innumerable English and American textbooks, was Hamilton's ultra-formal logic (*Lectures*, etc., 1859-1860; followed by Mansel, *Proleg. Logica*, 1851), which presented the Aristotelian analytic from the Kantian standpoint, treated concepts as fixed products to be mechanically combined and separated by thought, and proposed the quantification of the predicate, leading the way to symbolic logic. The mathematical or symbolic logic introduced by Boole (*The Mathematical Analysis of Logic*, 1847), which treated the proposition as an equation, thus laying the foundation for a logical calculus similar to the mathematical, and which was espoused by De Morgan (*Formal Logic*, 1847), Jevons (*The Substitution of Sim-*

lars, 1869), and Venn (*Symbolic Logic*, 1881), has not been academically of great significance.

It may be remarked, in conclusion, that the detached presentation of formal logic in academic courses is yielding to the inclusion of the essentials in the larger treatment of the general principles of knowledge.

LOGICAL METHOD. — The plan of procedure in developing school subjects may follow the sequence characteristic of an adult's thinking, in which case current pedagogical theory denominates it a logical method; or it may

proceed by the more rudimentary and tentative units of a child's comprehension, in which case it becomes a psychological method. For example, in the subject of primary arithmetic the child may first master the topic of notation and numeration, then addition, subtraction, multiplication, division, and fractions in the order named; or he may learn as much of any or all of these topics as his immediate needs determine in the first attack, taking up the same topics again more thoroughly with each recurring presentation until each topic is thoroughly comprehended. In both types of treatment the final outcome is the same, the pedagogical distinction arising out of the differing modes of approach. Strictly speaking, a psychological plan is rational from the child's point of view, and a logical method is psychologically natural to an adult. The pupil's last view of the subject through the psychological plan of attack ought, then, to correspond with the adult's logical way of viewing the field.

Young children should at first be taught through a psychological procedure, one that adjusts to their own outlook and experience. Instruction will then be more vital, but the teacher needs constantly to keep in mind that the final point of arrival should bring the child to see his experience in the perfected logical arrangement of a mature scientific mind which takes account of all the facts and classifies accordingly. The traditional plan of schools is to proceed by the logical order; pedagogical reform lays emphasis on the psychological order; the actual effect in current practice is a modified psychological order. It is not always easy for the individual teacher to keep in mind what has been covered by a strictly psychological plan; it is still more difficult for the co-operating teachers of a graded system to know what a given instructor has accomplished for the child. In consequence there is a tendency, after several special treatments of a topic, to assign the thorough mastery of a topic to a given grade in order that responsibility for thorough work may be fixed at a given place, and that the tendency toward scattering and fragmentary results which accompanies a strictly psychological arrangement of the course of study may be overcome. Such a more manageable, mixed order is, however, dominantly psychological in its progression. H. S.

LOMBARD COLLEGE, GALESBURG, ILL. — A coeducational institution chartered in 1851 as the Illinois Liberal Institute. The present title was adopted in 1899. Preparatory, col-

legiate, theological, and music departments are maintained. The entrance requirements are fifteen units. The courses in the college are divided into four groups, classical, modern, social science, and philosophy, leading to the A.B. degree, and science, leading to the B.S. The Divinity School confers the degree of B.D. The faculty consists of fourteen members. The enrollment in 1911-1912 was 92.

LONDON, EDUCATION IN.—**Historical.**—The history of London education for four hundred years is succinctly summarized in one of the earliest documents relating to it (c. 1118), the introduction to the *Life of Becket*, written by Fitzstephen, one of his clerks, who became a judge shortly after Becket's death. "In London the three principal churches have famous schools privileged and of ancient preeminence, though sometimes through personal favor to some one noted as philosopher more schools are allowed." The three principal churches to which these three schools were attached were St. Paul's Cathedral, St. Martin's-le-Grand Collegiate Church (now the General Post Office), and St. Mary-le-Bow Church, in Cheap-side, to be born in hearing of the bells of which constituted, till these modern days of din which drown all bells, the true differentia of a "cockney" or Londoner-born. Many other churches have been queried as being those meant by Fitzstephen, the great Elizabethan antiquary, Stow, in his *Survey* going so absurdly wrong as to include St. Peter's school, Westminster, when there is no trace of any school before 1380, and St. Saviour's Abbey, Bermondsey, where no grammar or public school existed at all. Besides, each of these places was about two miles from London. Fortunately a contemporary document still extant at St. Paul's puts beyond doubt what the three schools were. This is a writ of King Stephen's brother, Henry of Blois, Bishop of Winchester, and acting Bishop of London during a vacancy of the see from 1138 to 1140, to the chapter of St. Paul's Cathedral and the Archdeacon of London commanding them by their obedience that after three warnings they launch the sentence of excommunication against those who without a license from Henry the Schoolmaster presume to teach anywhere in the whole city of London, except those who teach the schools of St. Mary of the Arch (or "bow") and St. Martin's the Great (or Grand). Just as the Chancellor of Notre Dame Cathedral at Paris always gave license to teach school, even when the School of Paris had grown into the University with its many schools, so the schoolmaster, afterwards called Chancellor of St. Paul's,

was the licensing authority (see **TEACHERS, LICENSING OF**) for schools throughout London. St. Martin's-le-Grand was exempt because this was a collegiate church of canons like St. Paul's itself, founded before the Conquest, and enjoyed as all such collegiate churches of early foundation did, the right to keep a school, probably by special Papal and episcopal privilege. The church of St. Mary-le-Bow, belonging to the Archbishop of Canterbury, was exempt as such from the jurisdiction of his suffragan and subordinate, the Bishop of London, and was, in fact, the seat of Archbishop's Court, the Supreme Ecclesiastical Court of Great Britain, still called the Court of the Arches, from having been held among the arches on which (probably) the Church of the Arches or St. Mary-le-Bow was built.

St. Paul's school was, however, undoubtedly the oldest, as it was also the first in London. There can be little doubt that it was originally founded as part of the cathedral in 604 when King Ethelbert built "the church of St. Paul the Apostle, in which Melitius and his successors might have their Episcopal see," and "added lands and possessions for the use of those who were the bishops." But London underwent at least two, if not more, lapses into paganism, and whether we can date the continuous existence of St. Paul's either as church or school any earlier than 886, when King Alfred "settled the borough of London," and all the English turned to him, is doubtful. The earliest known reference to the school is in a document of about the year 1111, by which the bishop of London informed the dean and chapter that he had granted to Hugh the schoolmaster to hold by virtue of the dignity of his mastership the house of his predecessor, Master Durand of the Church of the Belltower, and also the custody of the cathedral library, with the keys of the cupboards by the altar which the bishop had ordered to be made for the books. Of St. Martin's-le-Grand school the only specific mention apart from its appearance in connection with the other two is in a city letter-book, on Thursday before 24 August 1295, when a cap or hat-maker of Fleet Street entered into a recognizance to pay £5 to Master Hugh of Wyttington, schoolmaster of St. Martin's-le-Grand; which recognizance was afterwards discharged when Hugh's brother and executor, Master John of Whittington, acknowledged payment of the debt. Nearly as scanty is the evidence as to St. Mary-le-Bow school, consisting of three entries as to the appointment of its master in the Archbishop's registers (1309, 1353, 1399).

Fitzstephen's account of these three schools shows that they were of the highest grade, and indeed some authors have inferred from his account that they constituted a London University. It is evident that the boys began with the elements of grammar, studied the classics, learnt to make verses, including epigrams;

then proceeded to rhetoric as in the rhetoric schools of Greece and Rome, and to logic, which was destined in the Universities almost to quench the classics altogether. At St. Paul's school, the City School *par excellence*, Thomas Becket as a boy and youth learnt the elements of rhetoric and logic which he perfected as a young man at Paris University (*annis igitur infantie* (under 7), *pueritiæ* (7 to 14), *et puerbitalis* (14 to 18), *domi paternæ et in scholis urbis decursis*, *Thomas adolescens factus studuit. Parisiis*). Not only are we told what they learnt in school, but what their games were. On Shrove Tuesday, the Carnival, the boys brought their fighting cocks to the school, and the whole morning was given up to watching them fight. In the afternoon they went to Smithfield, then a "suburban" open space, and played football, each school having its own game; and the elders and magnates looking on got as excited as they do nowadays over the games. When it froze they skated, and in summer evenings they walked out to those famous wells, Holywell, Clerkenwell, and St. Clement's Danes.

Unfortunately, we have no such illuminating document as this about St. Paul's or any other London school from the days of Becket to the days of Colet. We know that about 1198 the endowment of the school, which seems to have consisted of nothing but a school and the master's house given to Master Hugh, Becket's master who had succeeded Master Durand, who had been master at least from 1098, four acres of land at Fulham and the tithes of Ealing and Madeley, was largely increased. Bishop Richard FitzNeal found, when he became bishop in 1189, that the mastership enjoyed almost an empty name, with no, or, at least a very moderate, endowment, and so he added some two hundred acres of land and the tithes of Horsell. In 1205 a change took place which reacted unfavorably on the school. The canon-schoolmaster changed his title to that of Chancellor, and in accordance with a decree of a Lateran Council, thenceforth devoted himself to theological teaching and the Chancellor's theological school, taking the endowment for that purpose. (See CHANCELLOR'S SCHOOLS.) The school proper, the grammar school, was relegated to a deputy appointed by him, called no longer simply schoolmaster, but the grammar schoolmaster, who was also a canon and appears to have had no endowment beyond the school and house, except probably a payment of only £2 or £3 a year from the Chancellor. The cathedral statutes codified about 1294 mention only that the "Chancellor appointed a Master of Arts to the grammar school and is bound to keep the school in repair." He must, therefore, have been dependent almost entirely on tuition fees. This accounts for an interesting entry in the register of the almoner of St. Paul's, who had the charge of the choristers who were boarded in a house on the north side

of the cathedral and attended the grammar school for their literary, as they did the song school for their musical, training. The almoner writes in 1345 that "If the almoner does not keep a clerk to teach the choristers grammar, the schoolmaster of St. Paul's claims 5s a year for teaching them, though he ought to ask nothing, because he keeps the school from them as the treasurer once alleged before the Dean and chapter is to be found in ancient deeds"—an entire mistake on the treasurer's part. The choristers at all events received a good education, as an almoner in 1329 gave them by will his books, including his best "*Hugucio* and the big and little Priscian, Isidore's *Etymology*, all his grammar books, and in addition his books on Dialectic and Natural History, in order that they might be lent to boys apt for learning (*ad scolasticandum*) when they leave the almonry"; also books upon medicine and civil law. So, too, in 1313 and c. 1405 benefactors gave sums of money "to the poor choristers of Paules towards their exhibition in the University."

In the absence of cathedral documents, destroyed partly in the fire of London, but more by the carelessness of the custodians, we learn little about the school. In 1394 we find the three old privileged schools asking the king to prevent the Lord Mayor and aldermen from supporting "certain outsiders, pretending to be masters in grammar but having no sufficient knowledge in that faculty, who taught general (*i.e.* public) grammar schools in the city in deceit and fraud of the children, to the great prejudice of the King's lieges and the jurisdiction of Holy Church." As in the case in the Common Pleas about Gloucester Grammar School in 1410 it was stated as a matter of common knowledge that the schoolmaster of St. Paul's claimed a monopoly of school-keeping in London, they no doubt obtained what they wanted. We find, however, in 1419 a payment ordered by the Treasurer of the Exchequer of £4. 11. 6½ to the master of the grammar school at Cornhill for the board, teaching, and maintenance of a royal ward. By Feb. 1, 1425, John Seward "scolemaister" wrote a book of the muniments of the parish of St. Peter's, Cornhill, a copy of which is in the Gildhall. A need for more schools than the three must have been felt, as in 1441 the Bishop of London, the chief authority over St. Paul's school, sanctioned the appropriation to the Hospital of St. Anthony in Threadneedle Street of the church of St. Benet Fink, which stood next door to the hospital, for the endowment of a free grammar school, free from tuition fees, in the hospital. A little later it was connected with the University by the grant to Oriel College of lands for exhibitions there of boys from the school. In 1446 further competition of unlicensed grammar schoolmasters had taken place, persons not sufficiently instructed, presuming to hold "com-

mune gramer scoles" in great deceit of their scholars as also of the friends that put them to school. So the King directed the Archbishop and Bishop of London to provide a remedy, which they did by directing that there should be five schools only, the three ancient ones, one in St. Dunstan's-in-the-East, and St. Anthony's.

The opponents of monopoly, however, met this by a petition to Parliament next year presented in the names of the four parsons of All Hallows the Great, St. Andrew's at Holborn, St. Peter's, Cornhill and St. Mary Colechurch, the latter being schoolmaster of the Hospital of St. Thomas of Acon (St. Thomas à Becket). "The full wise and discreet Commons" were asked "to consider how London was the common concourse of the land wherein is great multitude of young people not only natives but from many other parts of the land some for lack of schoolmasters in their own country for to be informed of grammar there, some for the great alms of lords, merchants, and others. Therefore, it was expedient that in London were a sufficient number of schools and good informers in grammar, and not for the singular avail of two or three persons grievously to hurt the multitude of young people of all this land. For where there is great number of learners and few teachers and all the learners be compelled to go to the same few teachers and to no other, the masters wax rich in money and the learners poor in learning as experience openly sheweth against all virtue and order of wele publik," the Commonwealth. So the four asked that each of them might set up a "scole in the same science of gramer" in his parish, the master to be appointed and removed by the parson and his successors. The petition was granted. "The King wille that it be do as it is desired," but so that it be done by the advice of the Ordinary (the Judge of primary ecclesiastical jurisdiction, *i.e.* the Bishop of London, or the Archbishop of Canterbury). The saving clause was probably fatal. There is no evidence of any of the four schools, except St. Peter's, Cornhill, above mentioned. One of the parsons, that of St. Andrew's, Holborn, died next year; another, the parson of All Hallows, the year after. St. Thomas' Hospital was surrendered to Henry VIII in 1538. It was bought by the Mercers' Company, the richest of the London City Companies, whose hall stood next door, three years afterwards in 1541. The King sold it for £969 subject to the condition that the Company should keep three chaplains to pray for his soul, and a free grammar school with a sufficient master to teach twenty-five children and scholars freely (*i.e.* without tuition fees) forever. The Mercers' Hall now stands on the site and the school is still maintained. But the fact of Henry's making it a condition, *i.e.* imposing a trust to keep the school in 1541 is the only circumstance known from which it can be inferred

that any school existed in the hospital before its dissolution. As there is no trace of a school in the extant hospital registers the probabilities against any school having been set up before 1541 are very great. The absence of four schools wholly supported and entirely under the rule of four parish parsons cannot be supposed to have been a great loss to learning. That St. Paul's School continued to flourish appears from its master James Garnon being given the degree of Master in Grammar at Oxford in 1449, and from a *mot* of its "Scholmayster" on the sudden beheading of Hastings by Richard III in 1453 being reported by the chronicler Hollingshead. But it is evident that St. Anthony's was a serious rival and probably a superior rival. In 1472 we find the learned Selling, Prior of Canterbury, getting as headmaster of Canterbury School one who had lately taught grammar at Winchester and St. Anthony's, London, and Winchester was then *facile princeps* of English schools. Stow, who seems to have been himself a boy at St. Anthony's, mentions as of his own remembrance among its scions Sir Thomas More, the author of *Utopia*, Lord Chancellor and persecutor of Protestants, now beatified as a Roman martyr, who would have been there about 1485. The "Master Nicholas" who was master there in 1494-1495 was probably Nicholas Holt, one of the most famous schoolmasters of his day. Nicholas Heath, afterwards Bishop of Worcester, Archbishop of York, and Lord Chancellor under Queen Mary, was there about 1509. John Whitgift, Archbishop of Canterbury and founder of the very flourishing school at Croydon, a contemporary of Stow's, went there about 1537.

Meanwhile John Colet, who is said, though not on any first-hand authority, to have himself been a boy at St. Anthony's, refounded and re-endowed St. Paul's School. (See for more detailed statement COLET, JOHN.) The chief novelty in the new school was the large number of boys to be taught and the great increase in the salaries of the masters, the high master being given £34. 13. 4 as against the £10 given by Wykeham to the Headmaster of Winchester in 1382 and the £16 provided for the Headmasters of Eton and of St. Anthony's in 1443 and 1446 respectively. Also it was the first school, not in which Greek was taught, but in which the statutes mention it. Among the early pupils of the "newe scole of Poules" were Leland, the first and one of the most famous of English antiquaries, William Paget, who managed to remain in favor and power as secretary of state under Henry VIII, Edward VI, and Queen Mary, and as Lord Paget of Beaudesert was the ancestor of the Marquis of Anglesey. But the school does not seem to have kept up its reputation after Lily's successor and son-in-law Thomas Rightwous, or Rightwise as it was commonly spelled, took over the school in 1532. Stow, who went to St. An-

thony's about that year, recalls how the disputation of the London scholars, which we saw took place in Becket's day and which were expressly directed by a fourteenth century statute of St. Paul's School to be held "in logic and philosophy at St. Bartholomew's on St. Bartholomew's day and to be determined at Holy Trinity Priory" still continued in his time.

Education suffered no loss at all events in London, as is too often represented, by the dissolution of monasteries. The only school we know of in connection with any monastery, and that not for monks or taught by monks, was in the monastery, now the Almonry Grammar School at Westminster (see WESTMINSTER SCHOOL), and that so far from suffering from the dissolution, was put on a much larger and better basis in consequence of it. After, but not because of, the dissolution we find two joint foundations of schools and almshouses, founded, one by Sir George Monoux, a Lord Mayor, at Walthamstow, another, specially praised by Stow, at Ratcliffe, then on a country road which under the name of Ratcliffe Highway, became a byword as a dangerous slum. The dissolution of the monasteries, however, led indirectly to the foundation of that which became one of the largest and richest schools in London, Christ's Hospital (see under HOSPITAL SCHOOLS) in 1553, and half a century later of Charterhouse (*q.v.*). The school disputation, were, according to Stow, renewed in King Edward's day in the cloister of Christ's Hospital, "where the best scholars, still of St. Anthony's School," says the patriotic Stow, "were rewarded by bows and arrows of silver given to them by Sir Martin Bowes, goldsmith." The revival, however, could not have taken place under Edward VI, as Christ's Hospital was only legally founded on June 26, 1552, and was only entered on in November, 1552, and Edward died in January, 1553. It more probably took place under Mary. Anyhow it failed, owing to the quarrels between the boys, those of St. Paul's calling the St. Anthony boys pigs, and St. Anthony's calling the Paulines pigeons, and "proceeding to questions in grammar they usually fell from words to blows with their satchels full of books many times in great heaps. So finally they were restrained with the decay of St. Anthony's School." But in another place Stow attributes this decay to the Hospital being "spoiled" when one Johnson, the schoolmaster, became prebendary of Windsor. But in both, Stow's memory was at fault. Under Edmund Johnson, in the first years of Elizabeth, St. Anthony's was at the height of prosperity. On Sept. 15, 1562, "there set out from Mile End 200 children of St. Anthony's School, all well beseen and so through Aldgate down Cornhill . . . to the Friars Austin" (next door to St. Anthony's) "with streamers and flags and drums beating," very much like the famous *Montem* at Eton

(*q.v.*). This too in spite of an edict by the Lord Mayor in 1561 "for the staying of all schoolmasters and teachers of youth within this city from making of any more musters or open shows of their scholars . . . in rich apparel or otherwise, either on horseback or on foot, on pain of imprisonment." Johnson, who was a scholar of Winchester, only became a canon of Windsor in 1560, and died in 1562.

What caused the decay of St. Anthony's School was not its masters, but the setting up on a far larger site and in much better buildings and with larger endowments of Merchant Taylors' School, by the Merchant Taylors' Company, whose hall was on the opposite side of the street to St. Anthony's. (See MERCHANT TAYLORS' SCHOOL.)

Almost at the same time, 1560, the impetus given to Westminster School by the refoundation of the Collegiate Church, and its new statutes given by Queen Elizabeth, in which the school was connected with Christ's Church, Oxford, and Trinity, Cambridge, almost as Winchester and Eton with New College, Oxford, and King's, Cambridge, cut into the aristocratic elements of St. Anthony's and St. Paul's. St. Saviour's Grammar School, Southwark, set up by the parishioners in connection with the old Priory church of St. Mary Overy, also in 1560, which also adapted Colet's St. Paul's school statutes, cut off a suburban source of supply, while a patent was granted for a grammar school at St. Dunstan's in the west in 1562, though it had no endowment. Outer London was now being endowed with a ring of grammar schools: Kingston-on-Thames obtained a new charter for its ancient but perhaps decayed grammar school on March 1, 1561. St. Olave's, Southwark, set up a separate grammar school of a lower kind on July 29, 1561. Highgate Grammar School was founded by Sir Roger Cholmeley, chief Baron of the Exchequer, under a patent of May 6, 1565. Through the master being also incumbent of Highgate Chapel the school had in 1819 fallen into a purely elementary school taught by the sexton. It was revived in 1832 and is now one of the great schools of London with 455 boys, of whom 86 are boarders. Harrow (*q.v.*) was founded in 1571. In 1574 at St. Peter's, Cornhill, the parishioners paid £20 a year to the parson to provide a curate and also to pay for "8 poore chyldren to be taught frely in the grammer Skole called the Lybrary." At Croydon a school and almshouse foundation was founded by Archbishop Whitgift in 1599 and flourished considerably up to 1750 when it, too, fell into practical abeyance. It was revived by the Endowed Schools Commissioners in 1875 and is now divided into a Grammar School with 290 and a Middle School with 310 boys.

The Elizabethan era in London schools was more particularly distinguished by the effort made for elementary education. That there

was a great deal of elementary education in the city parishes before the Reformation is undoubted. Chantry priests and parish clerks taught schools like that described by Chaucer in the *Prioress' Tale*, which, though attributed to a city in Asia, is obviously drawn from a London street, in which the "little clergeon" and his "felaw" learned to sing and "could but small gramaire." But the parish records have disappeared. At St. Mary-at-Hill, where pre-Reformation Churchwardens' accounts have been preserved, we find John Northfolke, who received 6s. 8d. for keeping the "quere" (choir) and the organs all the twelve days in Christmas, had a "skole house" provided for him in the Abbot's Inn, and was given 3s. 4d. for him "and his company and the children when Master parson gave to them a playing week, to make merry." In 1547 a Welsh schoolmaster was paid £8. 10 a year for teaching the children there. So at St. Mary Woolnoth, another Welshman, named Jones, was paid £6. 10 for teaching the singing children. In 1542 Edmund Bonner, the subsequent persecutor of Protestants, issued injunctions directing every parson and chantry priest in London "to instruct, teach, and bring up in learning, the best ye can, all such children of your parishioners as shall come to you for the same, or at the least teach them to read English, taking moderately of their friends that may be able to pay." But it was not till Elizabeth's reign that any organized efforts were made. We then find in 1568 a schoolmaster in St. Lawrence Jewry being ordered to "avoid his school" and after that payments for a schoolmaster. The school was often in the belfry. Thus at St. Ethelburga's in 1589 "received of Smythe, the schoolmaster, for one year's allowance for keeping school in the belfry 10s." At St. Margaret's New Fish Street, in 1595, "Mr. Philip Manfield, M.A., to have the belfry to teach children in by consent of Parson Alton and the parishioners." In 1604 the parson himself was to keep a school in the belfry and make satisfaction, if there be any hurt by any disorder of his scholars. At St. Peter's, Cornhill, in 1609, the Parish Clerk was allowed to teach in the belfry. At St. Botolph's, Aldgate, in 1596 the schoolmaster, "using also the trade of a chandler," was chosen churchwarden. At St. John Zachery in 1600 "paid out about one Edward Laurence a schoolmaster 7s. 2d."

The reign of James I was signalized by a fresh outburst of school founding in London, Charterhouse (*q.v.*) being founded in 1611, followed by Dame Alice Owen's School at Islington in 1613, said to have been founded in thanksgiving for a narrow escape from being shot by an arrow, Camberwell Grammar School in 1615, Stratford-le-Bow in 1617, and Godsgift College at Dulwich, a belated imitation of Winchester and Eton by Edward Alleyn (*q.v.*), a successful actor in 1619. This was the most ambitious of all and might have been then what it even-

tually became through the growth of London, one of the first schools in London, but the founder married a second and young wife before the endowment was completed and its prosperity was delayed till reorganized in 1865 and 1882. Now it maintains four schools, two for boys and one for girls, the former with 673 boys, of whom 150 are boarders, and is among the first of the university scholarship winning schools in England. Alleyn's School has also 600 boys.

The Civil War almost stopped the growth of endowed schools in London and the neighborhood. But Colfe's School at Lewisham dates from the Protectorate of Oliver Cromwell in 1656. The fire of London finally ended St. Anthony's Hospital School, which was never rebuilt after it. Thenceforth there is little or no addition to the London secondary endowed schools. An era of private schools, some of them extremely prosperous, began with the Civil War, notably that of Farnaby (*q.v.*) and one John Milton, poet, also that of Thomas Singleton, expelled headmaster of Eton, who is said to have had 350 boys in a school in St. Mary Axe parish.

With the eighteenth century came the charity schools (*q.v.*), which were particularly successful, as they were particularly needed in London. In that century nearly all the old schools suffered eclipse, save Westminster (*q.v.*) St. Paul's in 1748 had fallen to thirty-five boys. Not until they were refounded by the Endowed Schools and the Charity Commissioners under the Endowed Schools Act, 1869, did St. Paul's, St. Olave's, Highgate, Croydon, Dulwich, or Camberwell recover the prosperity of the sixteenth century. Now St. Paul's, with its 600 boys in its new and spacious realm at Hammersmith, can regard itself as efficient as when it trained that brilliant controversialist, Thomas à Becket, or gave John Milton his bent to high themes of poetry. A. F. L.

See ARCHES, SCHOOL OF THE; CATHEDRAL SCHOOLS; GRAMMAR SCHOOLS; HOSPITAL SCHOOLS.

Present Position. — The history of education in London during the last century coincides with the development of education in England generally, and will be found treated in the article on ENGLAND, EDUCATION IN. Until 1903 education in the London area was administered by the London School Board. In 1903 a special act was passed extending the provisions of the 1902 Education Act to the London County Council, a body which had been established in 1888 under the Local Government Act. In 1889 the London County Council, like the other county councils, under the Technical Instruction Act of that year, was allowed to share in the local administration of technical education and established technical institutes and schools of art of its own and aided the polytechnics and the other institutions providing technical education which

had been established by voluntary agencies or by public subscriptions and which were under semi-public management. Further, the London County Council through the Technical Education Board aided the newly established "teaching university" of London and also the endowed and other secondary schools within the county. The aid given was restricted to subjects coming within the statutory definition of technical education. Thus, the London County Council had to a small extent taken part in educational administration before the acts of 1902-1903 came into force on May 1, 1904, and unified local administration by transferring to the London County Council the powers and duties of the London School Board.

Powers and Duties of London County Council. — The London County Council was established by the Local Government Act of 1888. The administrative county covers an area of 120 square miles. This area includes the city of London, whose ancient privileges retain their historic character and power and whose administrative system has been largely left untouched. The county area also includes the areas of twenty-eight metropolitan boroughs. But the county area does not include a considerable number of local authorities, whose areas, together with that of the London County Council, are popularly known as Greater London. The London County Council is the local education authority throughout the whole of the administrative area of 120 square miles. The city of London and the metropolitan boroughs appoint two thirds of the managers of the elementary schools within their areas, but they have no other duties or powers in respect of education.

The London County Council consists of a chairman, nineteen aldermen, and 118 councillors (three ladies). The councillors are elected triennially by fifty-eight electoral divisions: one division, the city of London, having four members. The Council's powers, duties, and liabilities include finance, main drainage, parks, highways, housing of the working classes, asylums, licenses for music, dancing, and theaters, public health, local pensions, shop hours and shop seats, and a great variety of others, as well as those of the local education authority. The Council by statute has also rights of representation on the Metropolitan Water Board and numerous other authorities of a specific character. The Council delegates many of its powers and duties to committees whose "orders of reference" are partly executive and partly advisory. The magnitude of the Council's operations may be gathered from two facts — it spends annually £10,000,000 sterling and employs 45,000 servants and officers of all kinds. The Education Committee, the only committee of the Council which sits in public, consists of fifty members (thirty-eight councillors and twelve coöpted).

All matters relating to the exercise of the Council's powers under the education acts,

except the power of raising a rate or borrowing money, stand referred by statute to the Education Committee of the Council; and the Council, before exercising any such powers, unless in their opinion the matter is urgent, receives and considers the report of that committee with respect to the matter in question. The Council may delegate to the education committee any of its powers under the Education Acts except the power of raising a rate or borrowing money. A large part of the powers and duties of the education committee are distributed among the following subcommittees: accommodation and attendance, books and apparatus, buildings, children's care, elementary education, general purposes, higher education, special schools, and teaching staff subcommittees. It is assisted in the administration of elementary education by 181 statutory bodies of managers for provided (council) schools and 355 for non-provided (voluntary) schools, and in the management of its own secondary schools, training colleges, technical institutes, and schools of art by advisory or local subcommittees. The Council also appoints representatives to serve upon the governing bodies of all schools and institutions to which it makes grants. In the various branches of higher education the Council is associated with several other authorities, such as the University of London, the city companies, the governing bodies of endowed secondary schools, and the governing bodies of polytechnics and technical institutes.

The Council spends annually about six millions sterling on education — about £5,000,000 on elementary and £1,000,000 on higher. As the receipts from government grants amount to about £1,600,000, an education rate of 1s. 9½d. in the pound has to be levied. The local education authority thus bears over 70 per cent of the cost of education, the national exchequer bearing less than 30 per cent.

The administrative staff of the Council for education consists of about 1000 officers, including over 100 inspectors and organizers. There are four divisional inspectors for higher education and twelve district inspectors for elementary education, as well as organizers of domestic economy and needlework, manual training, drawing, singing, trade schools, and children's care work.

The County of London is for administrative purposes (education) divided into twelve areas, to each of which there are attached, with their assistants: one district inspector; one divisional correspondent, who conducts the business of the local bodies of managers and associations of children's care committees; one divisional superintendent, who deals with questions of school attendance, employment of children, and the assessment of charges for meals and medical treatment; one district organizer of care committees.

Elementary Education. — Of the public elementary schools, 550 schools are provided and

maintained by the London County Council, and 365 schools provided as to fabric by religious and other organizations, but maintained by the London County Council. The accommodation provided amounts to 711,000 places, and there are 650,000 children in average attendance. The schools are open more than 400 half days per year, and the percentage of attendance on roll averages 89.5 per cent throughout the year. Attendance at school is compulsory between the ages of five and fourteen. The education given in both classes of schools is the same. As a rule, the schools are organized in three departments, for infants, boys, and girls. There are a certain number of mixed departments. Each department has its own headmaster or headmistress.

In addition to the ordinary elementary schools, there are some forty central schools (recently established) giving a superior elementary education for selected children who can remain at school up to the age of fifteen. The pupils are selected from the ordinary schools between the ages of eleven and twelve, and in a limited number of cases in which financial aid is necessary bursaries will be awarded from the age of fourteen to fifteen and one half years. (See INDUSTRIAL EDUCATION.)

Open-air schools have been conducted on a small scale during the spring, summer, and autumn months for pupils likely to benefit from open-air treatment. A number of playground classes have also been established in some of the poorest and most crowded districts of London.

Curriculum — The elementary school curriculum, like that of elementary schools elsewhere, has been framed with the object of developing the general intelligence, character, and adaptability of the children, and includes, in addition to English, arithmetic, history, and geography such subjects as moral instruction, nature study, physical exercises, organized games, swimming, domestic economy, and needlework for girls, and manual training for boys. Subject to a few general regulations, each head teacher frames her (or his) own curriculum. In the central schools the curriculum has an industrial or commercial bias.

Teaching Staff — The teaching staff numbers about 20,000 (men and women as three to seven), some 14,000 of whom are trained as well as certificated teachers. To fill the vacancies which occur throughout the year in London County Council schools there is formed annually a list of students specially selected from those who will leave the training colleges at midsummer. The teachers on the list are appointed permanently, and are allocated to particular schools as vacancies arise.

Teachers in non-provided schools are appointed by the managers of the schools, the appointment being subject to the consent of the Council, which may be refused on educational (not religious) grounds. Their salaries are paid by the London County Council. With re-

gard to salaries, security of tenure, etc., they are in the same position as teachers in Council schools.

Promotion to the post of head teacher is made from the ranks of the assistant teachers within the service, and for this purpose a promotion list is formed. Applicants for a place on this list must satisfy certain conditions as to service and qualifications.

The salaries paid are set out below: —

	ACCOMMODATION	MINIMUM	ANNUAL INCREMENT	MAXIMUM
Head-masters	—200	£150 ¹	£7. 10s.	£210
	201-400	200	10. 0	300
	401—	300	10. 0	400
Head-mistresses	—200	125 ¹	4	160
	201-400	150	8	225
	401—	225	8	300
Assistant Masters		100	5. 7. 10	200
Assistant Mistresses		90	4	150

¹ Salary as assistant + £10 with minimum of

Books and Apparatus. — Head teachers are supplied annually with lists containing particulars of all the articles which appear suitable for school use. All books and school material are supplied from the Council's stores on requisition by a head teacher which as a rule is made twice a year. School lending libraries are also provided by the Council for the encouragement of home reading.

Social Welfare. — The welfare of the child engages much attention. Care committees have been formed in connection with every elementary school in London, and the members of these committees (some five or six thousand voluntary workers) devote much personal service to the care of the children. Meals are provided from the rates for every necessitous child at an annual expenditure of £80,000. The number of children on the necessitous list averages for the whole year some 40,000. The average number of meals per child per week is 4.8, and the average cost of the meal is 2.18d. (food and preparation). (See FOOD AND FEEDING OF SCHOOL CHILDREN.) A large medical staff and service is employed by the Council for the medical inspection of school children, and arrangements have been made with hospitals and with local associations of doctors for the medical treatment of children suffering from ailments of the eyes, ears, nose, throat, and from ringworm. The medical staff also deals with the cleansing of verminous school children. Medical inspection is systematic, and some 225,000 children are inspected annually; the medical treatment scheme is yet incomplete. So far some 25,000 children annually are treated at the expense of the rates. (See MEDICAL INSPECTION.)

The Council also aids various voluntary agencies which provide recreative facilities for children out of school hours and during holidays. Local juvenile advisory committees have been established in various parts of London, with the object of finding suitable employment for children when they leave school and of looking after them and their interests when they obtain it. Efforts are being made to organize on a systematic basis the various voluntary agencies which have hitherto been engaged in finding employment for children on leaving school and to secure coöperation between the school care committees and the juvenile labor exchanges established by the government. Large provision is made in special schools for defective children of all kinds, — the blind, the deaf, the physically and mentally defective, and juvenile offenders.

Secondary Education. — Organization. — The County Council maintains twenty secondary schools, with an attendance of 4500 pupils at a gross cost of £80,000 a year. It also makes annual grants amounting to £80,000 to forty-two secondary endowed schools with an attendance of 15,000 pupils. In addition to these two classes of schools there are forty-five public or semipublic secondary schools neither maintained nor aided by the Council which provide for 12,500 pupils, and at least some 9000 pupils are known to be in attendance at schools conducted by individuals for private profit.

The pupils in the majority of the public secondary schools are of two classes, fee-paying and (in practice) scholarship holders, one of the conditions attached to the receipt of grants by secondary schools from the Board of Education being that 25 per cent of the school places must be reserved for free education for elementary school pupils. The fees charged range from £4. 13. 6 to £12 a year in the county secondary schools and from £2 10. 0 to £31 10 0 in the aided and non-aided secondary schools.

The curriculum in the county secondary schools is designed to give a good general education to pupils up to the age of eighteen. The teaching staff consists in the majority of cases of specialists in the subjects taught. The salaries paid in the Council's schools to headmasters vary according to the size of the school from £400 to £800, and to headmistresses £300. to £600 according to the size of the schools. Assistant masters receive £150 to £300 (in some cases £350), and assistant mistresses £120 to £220 (in some cases £250).

Scholarships. — The scholarship system may be divided into three classes, county scholarships for pupils desiring a good general education with, as an objective in many cases, a university or technical college education; technical and trade scholarships for pupils who desire an industrial training in substitution for the old apprenticeship system as a preparation for employment in skilled trades; and scholarships for students intending to become teachers. The maintenance

grants accompanying scholarships depend in all cases on the income of the parents or guardians of the scholar.

Junior county scholarships are awarded to children between the ages of eleven and twelve, and are tenable for three and in some cases five years. They cover free education at an approved secondary school and in most cases maintenance grants varying from £6 to £15 a year. Every eligible pupil in the London elementary schools numbering annually some 23,000 pupils, must compete for these scholarships. The number of scholarships awarded annually is about 1700. In principle these scholarships mean that the Council does not provide free secondary education for all who desire it, but only for those who can take full advantage of it. Intermediate county scholarships, 300 in number, are open to candidates between sixteen and seventeen years of age and cover free education at a secondary school or other institution for higher education up to the age of eighteen. The maintenance grants attached to these scholarships vary from £10 to £25 a year. Senior county scholarships are awarded to candidates eighteen years of age and upwards intending to pursue a course of study at an institution of university rank. Fifty are awarded annually, varying in value according to the financial circumstances of the candidates and the course of study they have in view. The technical and trade scholarships awarded by the Council vary considerably in conditions. Some provide free instruction in applied science or art with maintenance grants of £50 for day students; others provide free evening instruction with maintenance grants of £3 for artisans engaged in certain definite callings. In addition to these there are trade scholarships for boys and girls of fourteen years of age who wish to enter such occupations as book production, furniture and cabinetmaking, dressmaking, millinery, etc. Free tuition and maintenance grants varying from £6 to £15 a year are provided.

The scholarships for the preliminary education of teachers consist of bursaries followed by student teacherships, each tenable for one year. Bursaries are awarded at the age of sixteen to pupils who have attended a secondary school for three years, and are tenable for another year at the same school. At the expiration of this period the student is awarded a student teachership tenable for one year, during which period he receives training at an elementary school in the art of teaching prior to entering a training college.

Training of Teachers — The Council maintains seven training colleges with accommodation for 1660 students. The scheme of work, which covers a period of two years, provides a general education as well as instruction in the theory and practice of teaching.

One of the colleges (the London Day Training College) which is recognized as a school of

London University provides a four years' course with a view to the students, who are specially selected, obtaining a degree of the university in addition to the special professional training.

University Education. — The University of London (*q.v.*) consists of three classes of teaching institutions: (1) three colleges incorporated in the university; (2) twenty-nine institutions, including medical, theological, and law schools designated "Schools of the University," which are under separate governing bodies; (3) thirty other institutions at which certain teachers are recognized as teachers of, and certain courses are approved by the university. The London County Council works in close cooperation with the university and makes annual grants both to the university and to several of the constituent schools of the university, including the Imperial College of Science and Technology. The whole question of university education in London is at present under the consideration of a royal commission.

Technical Education. — The most advanced work in technical education is done in the institutions of university rank, but in addition to this a very large amount of technical, commercial, and general instruction is given in polytechnics, technical institutes, schools of art, and evening schools. The instruction given in these institutions covers a wide range of subjects, and as the students in attendance are drawn to a very large extent from those actually engaged during the daytime in industrial employment, the bulk of the work is done in the evening. Some 200,000 evening students are enrolled year by year.

Trade Schools. — In order to provide some approach to a substitute for the apprenticeship system, which has now practically disappeared, a number of trade schools have been established to provide a training for those boys and girls who are prepared to enter certain skilled occupations. The boys' schools provide in some cases a technical training for groups of trades, *e.g.* woodworking, building trade, engineering, and in others for specific trades, such as silver-smithing, tailoring, cooking and bakery. In the case of the girls' schools the preparation is for particular trades, such as dressmaking, millinery, corset making, upholstery, and laundry. The trade schools in London number seventeen, of which the Council maintains eight for boys with an attendance of 600, and four attended by 400 girls. In addition to these there are five trade schools in polytechnics, attended by 250 boys and 450 girls. The course of instruction in these schools is designed to turn out intelligent workers able to use their hands and their brains to the best advantage when they enter the workshops. The trade teaching is in the hands of teachers with first-class trade experience, and trade methods and standards of work are adopted.

Cost of Education. — Some idea of the relative importance and magnitude of the various

divisions in the Council's educational work may be gathered from some of the heads of the estimated expenditure for 1911-1912 (Capital and Maintenance), which are set out in round figures: elementary education, £2,740,000; secondary and university education, £390,000; technical and evening school education, £320,000; special school education, £200,000; social welfare of children, £125,000; maintenance of buildings, £740,000; books and apparatus, £140,000; total maintenance expenditure, £5,000,000; total capital expenditure on sites and buildings, £730,000.

System of Administration. — It has already been stated that the Council operates by means of committees partly executive and partly advisory. Where powers are delegated by the Council to the committee, that committee deals with the subject matter in the name of the Council and within the limits of the Council's statutory or other authority; in other cases the committee considers and reports on proposals for the Council's decision. The business of education is distributed among subcommittees, who in a like manner "deal with" or "consider and report on" according to the powers and duties intrusted to them by the education committee. The administration of the various services is conducted by departments. At the head of each department is a chief officer who may be called upon by any committee or its subcommittees to report to it on matters within the scope of his duties or their orders of reference. For example, the education officer conducts the business of the education committee, and is the principal executive officer in respect of education, but the clerk of the Council is the final authority on rules of procedure, and, for purposes of coordination, reports on the general effect of staff proposals (except in the case of teaching staff); the comptroller submits a criticism on the financial effect of the education committee's schemes and proposals, and in respect of education is also the accountant, paymaster, and audit officer; the solicitor reports on legal matters; the medical officer is an advisory and administrative officer in respect of medical inspection, medical treatment, cleansing, and so on, of school children; and the educational adviser, who has no executive or administrative duties, reports generally, presenting criticism or advice on the larger schemes or proposals which have been submitted to the subcommittees. The education officer's department is divided into six large branches, and the staff of these branches, subject to the general supervision and direction of the education officer, carry out the education committee's instructions and act as clerks or secretaries of committees of all kinds (central or local) concerned with education.

The education acts of 1902-1903, which brought into being a vast educational organization, have profoundly affected the quantity and quality of public education in England.

The London County Council has effected great reforms in every part of the educational field, and has developed and supplemented higher secondary and technical education into a fairly complete and coordinated system. One great reform remains. A Royal Commission on University Education in London has been at work since 1909. It is expected that the conclusions of this commission will have a powerful and far-reaching influence over the future of university education; and in the growth and development of an ordered system of institutions of university rank the London County Council as the local education authority is intimately concerned. There is one important difference between the powers and duties of the London County Council as local education authority and that of the board of education of a great American city. In England the State, while intrusting certain powers to and imposing certain duties on the local education authority, intrusts the general administration of its education acts to the Board of Education—a state (not a municipal) department; and the State enables the board, under Parliament and by means of grants in aid, to secure general control and direction of education throughout the whole of England and Wales. The grants in aid and the control are not always commensurate. It will thus be seen that, while an American city bears the whole cost of its educational system, it enjoys greater independence than the corresponding municipal authority in England.

LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

—An institution founded in 1895 and since 1900 a school of the University of London in the faculty of economics and political science (including commerce and industry). It was incorporated in 1901, among other purposes "to organize, promote, and supply courses of education specially adapted to the needs of persons who are, or who intend to be, engaged in any kind of administration, including the service of any government, local authority, railways, and shipping, banking and insurance, international trade, and any of the higher branches of commerce and industry and also the profession of teaching any such subjects." The work is arranged under the following heads: economics and statistics; politics and public administration; history, economic and political, including paleography; law; geography; sociology; commerce and industry; accounting and business methods; banking; transport; librarianship. In connection with the War Office a special course in administrative subjects has been arranged for a number of army officers, to equip them for the administrative staff of the army. The courses in transport are attended largely by students engaged in railway administration. Most of the courses are recognized by the University of London for its degrees. The school is, however, attended largely by special and postgraduate students engaged in research; by persons engaged in banking, insurance, accounting, railway administration, etc., and by administrative officers in the service of the government, central or local. Students working for degrees must satisfy the entrance requirements of the University of London. The school has power to grant certificates in geography, medieval history, including paleography and diplomatic, and in commerce. The school possesses a valuable library of some 60,000 volumes and 70,000 pamphlets bearing on its special work. The school issues its own series of *Studies in Economics and Political Science*, and the *Clare Market Review*, the students' magazine, publishes some results of the research work. The students are drawn from all parts of the world, and about 20 per cent are already graduates of some university. Grants are given to the school by the Treasury, by the London County Council, and several public and private bodies, which also maintain scholarships and prizes at the school. The number of students, men

LONDON TEACHERS ASSOCIATION

and women, enrolled in 1910 was 1626 under a faculty of 62 members.

LONDON TEACHERS ASSOCIATION, LONDON, ENGLAND.

— A professional association of teachers engaged in schools aided or maintained by the London Education Association. It was organized in 1872 as the Metropolitan Board Teachers Association, and has gradually increased its membership and scope of activity until it has become the largest association of its kind in the British Empire. It aims to secure the recognition of teaching as a profession, and has stood in the front in the struggle for professional freedom on such questions as tests for teachers, salaries, questions of corporal punishment, abolition of extraneous duties, inspection *versus* examination, superannuation schemes, size of classes, and freedom from outside interference. The government is in the hands of a general committee of one hundred members, and sectional interests are supervised by subcommittees, including mistresses, teachers in non-provided schools, teachers in higher education institutions, in central and higher grade schools, in evening schools, handicraft instructors, and domestic science instructresses. At the offices of the association members may receive advice on matters of professional difficulty such as, tenure, compensation, salary, sick pay allowances, unfair report, promotion, superannuation, breakdown allowances. The Association also secures to its members some important material benefits in the way of cooperative teaching, reduced rates of subscriptions, benevolent funds, and guidance and direction for holidays. The Association has also been frequently called upon to act as host to groups of foreign visiting teachers from the United States, Canada, Russia, and elsewhere, and is ready to give any information on education within the London area. The organ of the Association is the *London Teacher and London Schools Review*, which appears monthly. The membership in 1909-1910 numbered over 17,000. The General Secretary is Mr. T. Gautrey, who is an elected member of the London County Council, and has a seat on the London Education Committee.

Annual Reports and Handbooks.

LONDON, UNIVERSITY OF.— A body carrying on teaching functions in London and within a radius of thirty miles, and examining functions throughout the British Empire. As a teaching body it has relations of three kinds with the teaching and research institutions

LONDON, UNIVERSITY OF

connected with it; it is entirely responsible for the finance and management of the "incorporated" institutions, University College, King's College, and King's College for Women, and certain smaller institutions; it has visitatorial powers in regard to the "Schools of the University," thirty in number, at which it "approves" courses by teachers appointed by the schools who may or may not have been individually recognized by the university; and it approves courses also at other "public educational institutions," thirty in number, delivered by certain teachers who have been individually "recognized" by the university. The history of the university as a whole involves the history not only of the central body, but of the sixty teaching institutions whose relations with it are those described above. The oldest university institutions are the medical schools which have grown up within the great hospitals. For many of these it is difficult to fix a precise date of foundation. St. Bartholomew's Hospital, the oldest of the hospitals, was founded in 1123, and in 1662 medical and surgical students attended its wards. The creation of the University of London, as it at present exists, is traceable to a letter from Thomas Campbell, the poet, to Lord Brougham, published in the *Times* of Feb. 9, 1825, pleading for the establishment of a "great London University" to provide education for the class between "mechanics" and the "enormously rich."

The college erected in Gower Street, as the result of the appeal, was entitled the "University of London," and was opened in 1828 as a proprietary institution. In 1829 a charter was granted to King's College (opened in 1831) of which the educational objects were generally the same as University College, but which was established specifically as a Church of England institution. The efforts of the Gower Street College to obtain a charter of incorporation were unsuccessful, but in 1836 charters were simultaneously granted to a new body under the title "University of London" and to the Gower Street College under the title "University College, London." The foundation of University College and of the University of London for the first time made university education in England free from religious tests and accessible without scholarships to students of moderate means. The university, consisting of a senate nominated by the Crown (including among its first members Brougham, T. Arnold, and Faraday), was directed "to hold forth to all classes and denominations . . . an encouragement for pursuing a regular and liberal course of education," and was empowered to give degrees to students who had studied at University College, King's College, or other colleges to be affiliated later. The senate had no power to inspect affiliated colleges or inquire into their methods of teaching; its sole means of control was through its examinations. A large number of institutions were affiliated,

some of them secondary schools, and affiliation soon ceased to have any significance.

By the Charter of 1858 the senate were empowered to dispense with certificates of studentship in the faculties of arts and laws; for medical degrees certificates of attendance and clinical practice at a recognized institution were still required, and under this charter the degrees of the University in arts and laws (and later in all other faculties except medicine) were thrown open, without inquiry into their previous education, to all comers, not only in England, but in the British dominions overseas, where examinations were held in specially organized centers. The university became thus an examining body pure and simple, except in the case of medicine. Its examinations won a high reputation for their standard and their fairness; the examiners were almost invariably men of great distinction; and criticisms of the external system of examinations have nearly always been criticisms of the system rather than of the way in which it was carried out by the senate. The charter of 1858 first gave the graduates a status in the university by the constitution of a body of graduates of prescribed seniority called Convocation, with certain important though limited powers. In 1860 the degrees of Bachelor and Doctor of Science were first established, science subjects having been included previously in the arts curriculum. In 1867 a supplementary charter conferred on the university the right to hold examinations for women, and in the same year the university was granted the right to send a representative to Parliament. The senate and convocation agreed in 1878 to accept from the Crown a supplemental charter making every degree, honor, and prize awarded by the university accessible to students of both sexes on perfectly equal terms; it was the first university in the United Kingdom to admit women to degrees. The example of London led the older universities to offer greater facilities to women, and all the universities founded since 1878 in the United Kingdom have given women equal rights with men.

The complete dissociation of examining from teaching (except in regard to medicine) left the institutions for higher education in London unconnected with the university, and led to great dissatisfaction. In 1884 an association, presided over by Lord Reay, was founded to promote the establishment of a teaching university. A royal commission on the reorganization of the university, which was appointed in 1888, and reported in 1889, suggested that the existing university should ask for a charter to enable it to become a teaching university for London, as well as an examining body, but the report led to no result. A second commission, appointed in 1892, reported in 1894; its recommendations were enforced by Act of Parliament in 1898, and statutes made thereunder came into operation in 1900. The

new and complex constitution under which the university became a teaching university, but continued also the external examination system, though marking a great advance, proved inadequate to the needs of London. By two fresh acts of Parliament, first University College was incorporated in the university as from Jan. 1, 1907, and then King's College, as from Jan. 1, 1910. A further proposal to incorporate the Imperial College of Science and Technology, an institution itself of a very complex character, proved contentious, and led the senate to ask government to appoint a royal commission to consider the matter. The commission was appointed in 1909 under the chairmanship of Mr. (now Lord) Haldane, with a reference much wider than the senate had asked, and was authorized to inquire into the whole question of higher education in London. The evidence given before the commission shows divergency of opinion on many important points, and it is impossible to predict the results to which it will lead. The commission have, so far (January, 1912), issued only a single recommendation, dealing with the site of the central buildings of the university, which was first housed in Somerset House, removed in 1870 to Burlington Gardens, and again in 1901 to South Kensington, where it was allotted quarters in a building once occupied entirely by the Imperial Institute. The commissioners appeal for aid from public bodies and private generosity to provide a site and buildings in the center of London. It is anticipated that their final report will not be issued until 1913 or 1914.

The university is governed by a senate, including the Chancellor (Lord Rosebery), the Chairman of Convocation (both elected by convocation), and fifty-four other members, of whom sixteen are elected by university teachers, sixteen by the graduates, and the remainder are appointed by the Crown and various public bodies. The senate alone has executive power, but cannot act in matters relating to the teaching side without report from the Academic Council, of which four fifths consist of representatives of the teachers, nor in regard to specific subjects without reports from boards of studies also consisting mainly of teachers dealing with those subjects. In regard to external examinations, it can only act after report from the Council for External Students, mainly composed of representatives of the graduates, and in regard to university extension (*q.v.*), after report from the special board dealing with this matter. There are eight faculties: theology, arts, laws, music, medicine, science (including veterinary science and agriculture), economics and political science (including commerce and industry), and engineering. The faculties were designed mainly as bodies to elect teaching representatives to the senate; but they are frequently consulted for the purpose of coordinating reports from the boards of studies.

LONDON, UNIVERSITY OF

There is a general feeling among university teachers that their powers should be increased in future. The boards of studies, thirty-four in number, include, in addition to teachers of the university, distinguished specialists not connected with the university. The teachers of the university are either appointed and paid by the senate, or "recognized," but some of the teaching work in schools of the university is carried on by teachers appointed by the schools who do not receive the title of teachers of the university. A university professoriate is gradually being built up, but the scheme adopted by the senate has not yet been fully carried into effect, and some of the most distinguished teachers do not at present possess the title of "university professor" or "university reader."

The university, through its university extension board, besides conducting local lectures, undertakes the inspection and examination of secondary schools, and holds holiday courses for foreigners.

The incorporated colleges of the university are as follows: University College (opened 1828), King's College (opened 1831), King's College for Women (1881). The following institutions also form an integral part of the university: the Brown Animal Sanatory Institution (established in 1871), the Physiological Laboratory at South Kensington (established in 1902), the Francis Galton Laboratory for National Eugenics (established in 1904), and the Goldsmiths' College (established in 1891, reconstituted in 1904), which includes a department for the training of teachers and classes of a "polytechnic" character.

The following schools are unincorporated. —

London School of Tropical Medicine	1898	Medicine
Lister Institute of Preventive Medicine	1901	Medicine
Royal Army Medical College	1902	Medicine

NOTE: In the case of the medical schools the date given is that of the foundation of the hospital mentioned.

The number of registered internal students in 1910-1911 was 4400, but the actual number attending approved courses is probably about three times as great. In the calendar year ending April, 1912, there were conferred 569 degrees on internal students and 674 degrees on external students. The teachers' diploma, established in 1883, was in the same year conferred on sixty-nine internal and twenty-five external students.

LONDON, WILLIAM (fl. 1658). — Publisher, bookseller, and author, of Newcastle-upon-Tyne, England. In 1658 he published in London: *A Catalogue of the most vendible Books in England, orderly and Alphabetically digested; under the Heads of Divinity, History, Physics, Chyrurgery, Law, Arithmetick, Geometry, Astrology, Dualling, Measuring, Land and Timber, Gageing, Navigation, Architecture, Horsemanship, Faulconry, Merchandise, Limning, Military Discipline, Heraldry, Fortification and Fireworks, Husbandry, Gardening, Romances, Poems, Plays, etc., with Hebrew, Greek, and Latin Books for Schools and Scholars The like Work never yet performed by any. Varietas delectat. London, Printed in the year 1658.* London intended to add annual supplements of the year's publication, but only two appeared (1657-1658, and 1660). In the history of education too little attention has been paid to the question of the distribution of books, and in this respect London's book is remarkable. The *Catalogue* of 1658 contained 3096 titles, distributed as follows: Divinity, 1632; History, 468; Physics and Chyrurgery, 145; Law, 146; Mathematics, 227; Romances, 57; Plays, 103. (See Growoll, *A. Three Centuries of the English Book Trade Bibliography*, p. 49; New York, 1903.) Between two and three hundred books are included in the schoolbook list (Hebrew, Greek, and Latin), which added to Hoole's (*q.v.*) list arranged according to forms in his *New Discovery*, practically gives a complete schoolbook bibliography for the period 1640-1660. London's *Catalogue* contains an "Introduction to the Use of Books in a short Essay upon the Value and Benefits of Learning and Knowledge," written in an eloquent style which has been compared with that of Sir Thomas Browne, and Richard de Bury (*q.v.*), author of the *Philobiblon* (1473) (See Dibdin, T. F., in his edition of Sir Thomas More's *Utopia*, London, 1808.) F. W.

LONGFELLOW, S., *Life of Henry W. Longfellow*. (Boston, 1886.)

LONGITUDE AND TIME. — A subject formerly occupying considerable attention in elementary arithmetic, and still taught in many schools as part of this subject. It entered into the curriculum through the influence of

navigation upon commercial arithmetic. It concerns the finding of the difference in longitude between two places when the difference in time is known, or, conversely, the difference in time when the difference in longitude is known. Its practical use to the average citizen is confined almost entirely to a new phase of the subject, namely, Standard Time (*q.v.*) It is probable that the older treatment will give way to the discussion of this phase of the subject. When taught in the schools, it properly correlates with the work in geography, and, indeed, it may even better be treated as a topic in the latter field. There are no difficulties that stand in the way of an elementary presentation of the subject at any time in the sixth, seventh, or eighth school years. Most American courses of study omit it entirely at present, some require it in the seventh school year, and others in the sixth or eighth. Under any circumstances the points that merit most attention are: (1) the prime meridian, (2) the date line, and (3) standard time. In special schools for navigators it would, naturally, be treated much more extensively, as is the case in Europe, where these schools are more highly developed than in America. D E S

LOOMIS, ELIAS (1811-1889). — Textbook author and college professor; graduated from Yale College in 1830, and was tutor there from 1833 to 1836. He was professor in Western Reserve College (1837-1844), New York University (1844-1848), Princeton College (1848-1849), and Yale College (1860-1889). He was the author of fifteen textbooks on the mathematical and physical sciences. W. S. M.

LORD, ASA D. (1816-1875). — Normal school principal and city superintendent, educated in the district schools of New York and at the Potsdam Academy. He taught for several years in Ohio, and in 1839 he organized the Western Reserve Teachers' Seminary. During the eight years that he was at the head of the seminary, 800 teachers were under his instruction. He was superintendent of the schools of Columbus from 1847 to 1856; superintendent of the Ohio School for the Blind, 1856 to 1868, and superintendent of the New York School for the Blind at Batavia, 1868 to 1875. W. S. M.

LORD, NATHAN (1792-1870). — Sixth president of Dartmouth College; graduated from Bowdoin in 1809 and the Andover Theological Seminary in 1815. He was engaged in teaching and preaching, and was president of Dartmouth College from 1828 to 1862. He wrote several theological works. W. S. M.

LORDOSIS — See SPINAL CURVATURE.

LORINSER, KARL IGNAZ (1796-1853). — A German physician, born in Nîmes, Bohemia; studied at the universities of Prague and Berlin.

In 1822 he was appointed a member of the government medical board in Stettin, and in 1824 promoted to a medical inspectorship in Koslin, and later in Oppeln. In 1829-1830 he undertook a journey to eastern and southern Austria for the purpose of investigating the plague which was then raging in those countries. He became noted through an attack on the hygienic conditions of the Prussian schools, which he severely criticized in a pamphlet, *Zum Schutze der Gesundheit in den Schulen* (For the Protection of Health in the Schools, Berlin, 1836). This work gave rise to a heated controversy, known as *Der Lorinserische Schulstreit*, in which many physicians and schoolmen took part, and which was largely instrumental in bringing about reforms affecting the health of the pupils of the higher schools, particularly with regard to physical training and the question of overpressure.

He also published a number of medical works and wrote an autobiography in two volumes, which was edited by his son (Regensburg, 1864). F. M.

LOTZE, RUDOLPH HERMANN (1817-1881). — Philosopher, born in Bautzen, Saxony, the son of a physician; he determined in early youth to follow his father's profession. In March, 1838, he received the degree of Doctor of Philosophy from Leipzig University, and in July of the same year that of Doctor of Medicine. In 1839 he became a member of the Faculties of Medicine and of Philosophy at Leipzig, where he remained until called in 1844 to Göttingen to succeed Herbart. In 1881 Lotze accepted a call to Berlin. He had but entered upon his work there when his death occurred in July of that year. His life was uneventful in incident, and his activities were always in some measure restricted by ill-health.

Lotze's literary career may be divided into three periods: (1) Scientific and early philosophical period (1840-1852). The works of this period are chiefly scientific, pertaining to biology, physiology, and medicine. Even in these scientific writings, however, there is obvious a tendency to reach down to the philosophical principles underlying science. To this period belongs the *Medicinische Psychologie oder Physiologie der Seele* (1852), a pioneer work of the new psychology. (2) The period of the *Mikrokosmos*, *Ideen zur Naturgeschichte und Geschichte der Menschheit* (3 vols. 1856-1864; Eng. tr. by Hamilton and Jones), the aim of which is to reconcile the mechanical and the teleological views of the world. (3) The period of the *System der Philosophie*, in which Lotze purposed to present his philosophical views in comprehensive and systematic completeness. The first two parts only of the projected work were completed, the

Logik (1874, Eng. tr. ed. by Bosanquet) and the *Metaphysik* (1879, Eng. tr. ed. by Bosanquet). The third part, treating of morality, æsthetics, and religion, was left unfinished at his death. Several little volumes compiled from his lecture notes in part make good this deficiency. The most important of these are *Outlines of Æsthetics*, *Practical Philosophy*, and *Philosophy of Religion* (Eng. tr. by G. T. Ladd). To this period also belongs the *Geschichte der Æsthetik in Deutschland* (1868).

As a philosophical writer Lotze is notable for elegance of literary style, for discretion in metaphysical speculation, for the breadth of knowledge and wealth of culture manifest in all his works. His general philosophical position may be defined as that of teleological idealism. Three chief conceptions underlie his metaphysics, — the conceptions of unity, of teleology, and of personality. The unity of all things in the World-Ground is the central doctrine of his metaphysics. The proof by which this is established is a negative one, resting upon the disproof of the possibility of reciprocal action between things conceived as independent and unrelated. Lotze's discussion of causation, in this connection, is one of the most characteristic and valuable features of his metaphysical theory. His conclusion is that all so-called transeunt action is in reality immanent action, that causal action is possible only because all things are immanent in the World-Ground. Having shown that cosmological speculation leads inevitably to the positing of one Infinite Being as the Ground of all that is, Lotze proceeds to identify this Absolute with the religious conception of God. By three distinct lines of argument Lotze seeks to establish the personality of God: The Infinite must be a Person in order to be the ground of finite personality; the source and ground of the moral order and moral ideals must be sought in a personality, and finally, reality can be predicated only of that which exists as personality. The argument that to ascribe personality to the Absolute is to limit that Being, Lotze meets by a counter assertion, namely, that the Absolute is the only complete personality, of which human personality is but the finite and imperfect copy. The idea of teleology is also implicit in Lotze's fundamental conception, for the Good is an active principle which realizes itself in all reality. To justify his belief in a final purpose which prescribes the course of the world is the chief aim of Lotze's philosophical undertaking. His discussion of the teleological explanation of the world order, as contrasted with the mechanical, is characteristic and luminous. The express aim of the *Microcosmos* is to show "how absolutely universal is the extent and at the same time how completely subordinate the significance of the mission which mechanism has to fulfill in the structure of the world." His insistence upon the universal validity of the

mechanical principle rightly understood, the clearness with which he shows forth the inadequacy of a mere external mechanism and the incompleteness of mechanism as a final explanation, and his noble attempt to prove a teleological principle active in the world through the instrumentality of a universal mechanism, are all features which give this discussion great and lasting value.

Lotze's contributions to both psychology and logic have been important. The *Medicinische Psychologie* extends the principle of mechanism to explain the relation of mind and body and lays the foundation of that branch of modern psychology known as psycho-physics. Lotze is notable for his local sign theory, according to which non-spatial sense attributes, varying according to the locality of the sense organ stimulated, afford the original data out of which our space knowledge is built. The fundamental tenet of Lotze's logical theory is his belief that the mind is essentially active, contributory, in all elements of knowledge. For though the mind cannot act until it is acted upon, yet the matter of its responses is its own, it reacts upon every impression in its own characteristic manner. All our knowledge rests ultimately upon certain universal propositions, or axioms, which are in reality the products of certain habits of action native to the human mind. Our hope of mastering the course of events in the real world rests on three things: (1) Some given reality which thought cannot create. (2) The universality of law in the real world, ultimately a matter of faith. (3) Synthetic judgments *a priori* as the basis of our knowledge of particular laws.

Lotze's influence upon education has been general rather than specific, the influence of an idealistic philosophy with a strongly religious and ethical bent, and reflecting at every point the broad culture and lofty ideals of the man whose system of thought it is. We find in his writings many of the ideas and principles that are vital in educational theory at the present day. The emphasis upon activity and development would seem to ally him with the psychological tendency in modern education; his positive contributions to science and his estimate of the importance of scientific knowledge ally him with the scientific tendency; while his sense of the value of the finite personality, the significance of the aspirations and religious faiths of mankind, and the importance of the study of human institutions and human progress, are in accord with the moral and sociological ideals of the foremost educational thought and effort of today.

LOUIS AGASSIZ SUMMER SCHOOL.—
See SUMMER SCHOOLS.

LOUISIANA, STATE OF.—Originally a part of the French territory of Louisiana, obtained by purchase from France in 1803. The present state of Louisiana was first organized as the Territory of Orleans in 1804, and was admitted to the Union in 1812 as the eighteenth state. It is located in the South Central Division, and has a land area of 45,420 square miles. In size it is about the same area as Pennsylvania. For administrative purposes it is divided into fifty-nine parishes, a term corresponding to county elsewhere, and these are in turn divided into police jury wards, the number varying from five to ten, except in the parish of Orleans, which has seventeen wards. In 1910 Louisiana had a population of 1,656,388 and a density of population of 36.5 per square mile.

Educational History.—The first school in the territory was established by a company of Ursuline nuns, who opened a charity hospital school for girls in New Orleans in 1727. A Capuchin school for boys was also opened about the same time. After the Spanish occupation, several Spanish teachers were sent over, in 1772, to attempt to change the language of the people, but their schools were very poorly attended. They are reported as not having had more than thirty pupils at any time, while eight French schools, which were then in existence, enrolled about 400. In 1805 the University of New Orleans was founded, a very ambitious project, on the plan of the University of France. This was to include schools of all grades, an academy and a public library in every parish, and a University in New Orleans. The project received aid until 1826, when it was definitely given up.

In 1806 a free school law was enacted, but was repealed in 1808. In 1811 the sum of \$2000 for buildings and an annual grant of \$500 was made to each parish for an academy. The first constitution of the state, framed in 1812, contained no mention of education. A few primary schools were established in the different parishes, and in 1819 the police juries of the parishes were directed to supervise and care for such schools. In 1821 the law was changed so that the police juries were directed to appoint five resident landowners as trustees. In the same year an appropriation of \$800 was made to each parish for the benefit of an academy in return for the instruction of eight pupils free. A parish tax of \$1000 annually was also authorized. Grants of various kinds were made during the next twenty-five years to the parish

and parochial schools, and to academies and colleges, in return for the free instruction of a certain number of indigent pupils. This has well been called "the beneficiary period." It began about 1811, and lasted until the final adoption of the free public school principle in 1845. In 1827 it was enacted that the state might give \$2.62½ monthly for each student educated in the parish schools up to \$1350 per parish, and it was provided that all indigent children must be received in the parish schools. By 1834, 1175 indigent children were being educated in the state.

In 1833 the Secretary of State was made *ex officio* Superintendent of Education. During the next ten years a number of governors and educational committees recommended the entire abolition of the subsidized parochial system, and the substitution of a free public school system in its place. In 1841 New Orleans was permitted by special act to establish a free public school system, to employ a superintendent of schools, and to raise money for schools by local taxation. The example of this city, which in a few years compared favorably in school attendance with the larger cities of the North, exercised a good influence in shaping public opinion for free schools in the state. In 1845 a commission of five was appointed to extend the public school system, and the new state constitution of 1845 put an end to the old system of subsidized private schools, and provided definitely for a system of public education.

The legislature was directed "to establish free public schools throughout the state" and "to provide means for their support by taxation on property, or otherwise"; the office of Superintendent of Public Instruction was created; the common school fund and the seminary fund were defined and declared to be perpetual funds upon which the state was to pay 6 per cent interest; and a University of Louisiana in New Orleans was provided for. The constitution of 1852 practically repeated the provisions of the constitution of 1845, but changed the superintendency of public instruction from appointment to election, and gave the General Assembly power to abolish the office when "no longer necessary." The free school law of 1847 carried the mandates of the constitution into effect; created the office of parish superintendent, abolished two years later; levied a one-mill state tax for schools; clearly defined and definitely provided for the creation of a permanent state school fund by the consolidation of all land grants and donations; and provided for the distribution of the income to the parishes on a census basis (in 1852 the constitution was amended to insure this); declared the schools open to all white children between six and sixteen, and insured every white under twenty-one two years of tuition free; gave the control of the schools in each district to three directors; and authorized dis-

trict taxes for school buildings. The University of Louisiana was established, and continued to exist until its absorption by Tulane University in 1884. In 1852 a State Institute for the Deaf and Dumb was established. In 1859 a normal school was established by the legislature in New Orleans, and in 1860 the State Seminary of Learning was opened at Alexandria. In 1855 a poll tax of \$1 was levied for schools in addition to the above. By 1852 one half of the educable children of the state were reported as in attendance at the public schools. Even yet the schools were not entirely free for the entire term, as one sixth of the revenue in 1850 and one eighth in 1860 still came from tuition fees. Schools continued during the early part of the Civil War period, the legislature of 1862 appropriating \$485,000 for free public schools; but the war practically put an end to this early school system.

In 1864 a new constitution was adopted, largely as a war measure, by General Banks, which retained most of the provisions of the preceding constitutions, but omitted the census basis for the distribution of school money; omitted all mention of the seminary fund, provided for a four-year term for the State Superintendent and a salary of \$4000 per year; and ordered that all schools should be taught in the English language. The reconstruction constitution of 1868 retained the provisions of the preceding constitution; raised the salary of the State Superintendent to \$5000, ordered a public school in every parish; and forbade any distinction as to "race, color, or previous condition," or any appropriation or subsidy to any private school or teacher.

The law of 1869 carried these constitutional provisions into effect. The state was divided into six districts, and for each of these a district superintendent, reporting to the State Superintendent, was provided. To an appointed State Board of Education was given the control of all state institutions and the appointment of all local boards of education. The state tax was increased to two mills, and local district taxes up to five mills were authorized. In 1870 a parish tax of two mills was also authorized. The effect of these new provisions was unduly to centralize and increase the cost of administration, and to turn the schools over almost entirely to the colored race, except in the rural parishes, where separate schools for the whites were maintained in defiance of the law. Little progress was made in general education in the state until 1887, when separate schools for the two races were established. By 1875-1876 the total school enrollment was only 74,846 out of a school population of 274,688. In 1870 the State Seminary of Learning was converted into the University of Louisiana, and moved to Baton Rouge, and in 1872 the Land Grant College was consolidated with it. In 1871 the State Institution for the Blind was established. In

1872 the legislature, to obtain money for salaries and mileage, confiscated the permanent school fund.

In 1879 a new constitution was adopted, which changed the form of administration and materially reduced the expense for this item. The office of State Superintendent of Public Education was continued, but only \$3000 was allowed for his salary and the expense of his office; district state superintendents were abolished, and parish boards were permitted to appoint a parish superintendent, but at a salary of not over \$200 a year; instruction in the French language and separate schools for the two races were made possible; the legislature was directed to establish a university at New Orleans for negroes and to appropriate not less than \$5000 nor more than \$10,000 a year for its maintenance; and the debt of the state to the free school fund, confiscated by the legislature of 1872, to the seminary fund, and to the agricultural and mechanical college fund, was determined and declared a perpetual obligation, but the interest on these debts was lowered and was to be paid from the annual appropriations for schools. The new constitution of 1898 contains similar provisions to those of the constitution of 1879, but amplified and made somewhat more definite. A school census was ordered; the debt to the school fund was directed to be paid out of the state's revenues and not out of the annual school appropriations; the restrictions as to the salaries of parish superintendents were removed; and the prohibition of aid to sectarian schools was extended to private schools as well.

In 1881 the Southern University for Colored Students was opened; in 1884 a state normal school was established, and opened the next year at Natchitoches; in 1884 the old University of Louisiana, established in 1847, was absorbed by the new Tulane University, and Tulane University became a semi-public institution; in 1888 the State Board of Education was directed to advertise for bids for a uniform system of schoolbooks for the schools of the state, to be adopted on four-year contracts; in 1896 teachers' examinations were systematized and made uniform throughout the state; in 1894 the Louisiana Industrial Institute, a literary and industrial school of secondary grade for whites, was established at Ruston, and in 1898 the South Western Louisiana Institute, a similar school also for whites, was established at Lafayette. In 1898 a State Biologic Station, for investigation and for the training of teachers in biological sciences, was established at the mouth of Calcasieu Pass, near the Gulf of Mexico. In 1902 special tax districts, with local taxes, were permitted. In 1904 a \$600 minimum salary for parish superintendents was fixed by law.

In 1906 credentials were accepted from state institutions for teachers' certificates. In 1908 the state constitution was amended so as to

increase the salary of the State Superintendent from \$2000 to \$5000; parish (county) superintendents were made school treasurers *ex officio*; the limit of local tax was raised from 1½ to 3 miles; and a child labor law was enacted. In 1910 the parish school boards were given the right to levy taxes, independent of the county authorities; a state textbook commission was created, and the period for adoptions extended from four to six years; monthly teachers institutes and the study of agriculture were required.

Present School System — At the head of the school system is a State Board of Education and a State Superintendent of Public Education. The State Board of Education is composed of the Governor, the Superintendent of Public Instruction, and the Attorney-General, together with seven citizens appointed by the Governor, one from each congressional district of the state. Appointed members receive the same pay as members of the legislature. Subject only to the legislature, this body is the supreme authority in the state in educational matters. Appeals from the decisions of the State Superintendent may be made to it for final settlement; its suits are given preference in courts of law, and bond and security are not required; it approves all requests for permission to establish high schools in the state; it is empowered to adopt a uniform course of study for the schools of the State; it outlines the courses of study for all teachers' training schools, and provides all rules and regulations for the examination of teachers; the quadrennial school census is sent to it by the parish assessors for approval; it has power to ask for special reports from the parish superintendents, and may make rules and regulations for the government of the schools of the state, not forbidden by law. The Superintendent of Public Education is elected by popular election for four-year terms, and receives a salary of \$5000 per annum, with an appropriation for office expenses. He is *ex officio* a member of the State Board of Education, and also acts as its secretary and its executive officer. He is also a member of the Boards of Supervisors of the State Schools, of the Board of Institute Managers, and of the State Board of Examiners. He has the general supervision of the schools of the state; decides disputes sent to him on appeal, subject to final approval of the State Board of Education; may call conventions of school officers for consultation; apportions the school fund to the parishes; and calls meetings and publishes the proceedings of the State Board of Education. In addition to the State Board of Education, there is a State Board of Examiners, consisting of the State Superintendent, the president of the Louisiana State University, and the president of the Louisiana State Normal School, which is empowered to adopt rules and regulations for the examination of teachers for state certificates; and also a Board of State Institute

Managers, consisting of the State Superintendent and the president of the State Normal School, who have control of the summer normal schools of the state and select the institute conductors. A State Textbook Commission adopts uniform texts for the state and is instructed by law to show a preference for Louisiana books.

For each parish (county) there is a parish board of school directors and a parish superintendent of public education. The parish boards are elected by the qualified electors of each police jury ward of the parishes, one from each ward, and for four-year terms. Teachers are not eligible for membership on these boards. Members of parish boards may be removed from office by the Governor, if the State Board of Education approves. Each parish board elects a parish superintendent of public education for a four-year term, who serves as secretary of the board and as its executive officer. Parish superintendents must hold a certificate of eligibility from the State Board of Education, and the revocation of this certificate vacates the office. Parish boards have general supervision of the schools of the parish, elect all teachers for the schools on the nomination of the parish superintendents; appoint two teachers to assist the parish superintendent in examining teachers, are charged with the care and preservation of the school property of the parish; on the recommendation of the parish superintendent, locate and change the location of schools; estimate the amount of school money needed each year; may issue bonds for school purposes; may appoint auxiliary visiting trustees for each ward, or school district, or school in the parish; and must make detailed reports to the State Board of Education as to the conditions of the schools and the work of the school officials.

The parish superintendent is required to devote his entire time to the work of supervision; conducts examinations for teachers' certificates; nominates teachers for election by the parish boards, signs all contracts; may remove teachers for cause; must visit each school at least once each year; must hold monthly teachers' institutes on Saturdays; is treasurer for the parish school funds; makes quarterly reports to the State Superintendent on the condition of the funds, pays out all money on the order of the president and secretary of the parish board; has charge of the sale and preservation of any sixteenth-section lands; and must make quarterly reports to the parish board, and annual reports to the State Superintendent, and reports as called for to the State Board of Education.

The Parish of Orleans, whose boundaries are the same as those of the city of New Orleans, receives larger liberty and special privileges in the matter of school government and school taxation, being governed, in part, by special legislation.

School Support. — Louisiana originally received 786,044 acres of land in the sixteenth-section grants. Much of this was so located as to be of little value, and some of it is still on hand. The annual interest on this fund is apportioned to the townships to which the land originally belonged. The state also received its share of the United States Deposit Fund, distributed in 1837. This was devoted to material improvements at the time, but the interest on the fund (\$28,795 14) is now devoted, according to the provisions of the constitution of 1898, to the support of common schools. The state also received two townships (46,080 acres) of land for a seminary of learning, and 210,000 acres for an agricultural and mechanical college. The funds were largely lost during the war or squandered during the Reconstruction period, and remain to-day as "perpetual obligations," for which the state taxes itself to pay the annual interest due on the several funds.

The constitution requires that not less than one and one fourth mills of the six-mill state tax shall be applied to the support of schools. The State School Fund is apportioned directly to the parishes on the basis of the number of children in each between the ages of six and eighteen, as determined by a quadrennial census. The proceeds of the state inheritance tax are also added to the annual school fund.

The police juries of each parish must levy a parish tax for schools of not less than three nor more than six mills. Councilmen or trustees in cities, towns, or villages, and the people of school districts, may vote (since 1902) special taxes for additional school facilities. In 1907 there were 509 such special tax districts, as against 389 in 1906, 272 in 1905, 199 in 1901, and 153 in 1903. A poll tax of \$1, fines, and forfeited bonds, remain in the parishes where collected, and are added to the current school funds. Special school taxes may also be voted for buildings, improvements, or support, by petition, election, and an affirmative vote. The old "fuel tax" is still levied in Louisiana, parish boards still having "authority to assess and collect \$1 per annum on each family" sending a child or children to school.

Educational Conditions. — Of the total population nearly one half are negroes, and over 90 per cent are native born. But two states, Mississippi and South Carolina, contained a larger proportion of negroes. In thirty-one of the fifty-nine parishes the negroes outnumber the whites; in seventeen parishes they outnumber the whites two or more to one; in two parishes they outnumber them six to one, in two others, eleven to one, and in one sixteen to one. Of the total population of the state, one fifth live in the city of New Orleans, and of the remaining four fifths, about 73 per cent live in rural districts. There are but two other cities in the state, Baton Rouge and Shreveport, which have 8000 inhabitants. The state

LOUISIANA, STATE OF

is essentially a rural and agricultural state, with one large commercial city.

The percentage of illiteracy is still very high, notwithstanding recent large deductions. A child labor law has been enacted recently, but the state has as yet no compulsory attendance law, or means of enforcing attendance. Only 62 per cent of the schoolhouses are owned by the parishes, but 69 per cent of the schoolhouses are listed as being provided with blackboards; but 70 per cent as having any means of heating the building; but 65 per cent as being provided with patent school desks; but 58 per cent as having charts and maps; and but 22 per cent as having a globe. The average value of all forms of school property, the city of New Orleans included, is about \$2000 per school. Little beyond the regular common school branches is taught in any of the elementary schools. Graded schools, containing the upper grammar school grades, are to be found in most of the towns, and may be established, where necessary, by the parish boards. Manual training is provided in very few school systems. Elementary schools may also be taught in the French language, where French is spoken. Uniform textbooks for the schools of the state are adopted by the State Textbook Commission on six-year contracts.

Teachers and Training — For the training of teachers the state maintains the Louisiana State Normal School, at Natchitoches, and the Parish of Orleans maintains the New Orleans Normal and Training School. The state also provides a State Institute Conductor, who is appointed by the Board of State Institute Managers (Superintendent of Public Education and president of the Normal School), receives a salary of \$2500 and traveling expenses, and has charge of the summer normal schools, one-week institutes, and parish teachers' association meetings. To meet the expenses of these, the state appropriates \$12,500 annually, the Peabody Fund gives \$2000, and all persons taking an examination for a teacher's certificate pay a fee of \$1 each. The summer normal schools are graded, and are held at various points in the state. Ten of the summer normal schools were for white teachers and four for colored teachers. The term varies from three to eight weeks. The conductor also holds one-week institutes and directs the work of the Teachers' Association Meetings in the parishes. The latter involved reading circle work, and the outline of work called for seven meetings in each parish during the year. About one third of the teachers attended the one-week institutes, and about two thirds were members of the Parish Teachers' Associations and Reading Circles. Luther College, a Lutheran College in New Orleans, conducts a normal department for colored teachers of both sexes.

Secondary Education. — A high school system for the state is yet to be developed. Most

LOUISIANA STATE UNIVERSITY

of the secondary schools of the state are in part secondary and in part elementary, and few reach the standard of a regular high school. The two Industrial Institutes maintained by the state are in effect technical secondary schools of a good grade. Excepting in the Parish of Orleans, high schools can only be established with the consent of the State Board of Education, and no school can be opened without its sanction, or established unless a site and buildings are provided free of any expense to the school fund.

Higher and Other Education — The Louisiana State University and Agricultural and Mechanical College, at Baton Rouge, stands as the nominal head of the state school system of Louisiana. Tulane University, in New Orleans, however, has been recognized by law (1884) and by vote of the people (1888) as the successor, in interest, of the old University of Louisiana, opened in 1834, and receives one student free of tuition from each senatorial and representative district in the state. The state also maintains the Southern University at New Orleans for colored students, appropriating (1909) \$10,750 for its support. In addition to the above institutions, eight denominational colleges, three of which are for the colored race, supplement the secondary and higher instruction provided by the state.

Special Institutions. — The state maintains the Louisiana State School for the Blind and the Louisiana State School for the Deaf at Baton Rouge; the Louisiana Industrial Institute at Ruston; the South Western Louisiana Industrial Institute at Lafayette; and the State Biologic Station on the Gulf of Mexico. The two industrial institutes offer good secondary instruction to the whites of both sexes in both the academic and industrial courses. E. P. C.

LOUISIANA STATE UNIVERSITY AND AGRICULTURAL AND MECHANICAL COLLEGE, BATON ROUGE, LA. — A coeducational institution which had its origin in grants of land made by the United States government "for the use of a seminary of learning." In 1853 the Louisiana State Seminary of Learning and Military Academy was

founded near Alexandria, opened in 1860, and was removed to Baton Rouge in 1869. The Agricultural and Mechanical College was established in 1873 at New Orleans to carry out the purposes of the Land Grant Act of 1862. The two institutions were united and located at Baton Rouge in 1877, and are maintained by the state. The institution is located on the grounds of the old military garrison, overlooking the Mississippi River and covering nearly 210 acres in extent. The university is an essential part of the state school system. It embraces a College of Arts and Sciences, a College of Agriculture, a College of Engineering, the Audubon Sugar School, the law school, the teachers' college, and the graduate department. Four experiment stations are maintained in Baton Rouge, in New Orleans, at Crowley, Acadia Parish, and at Calhoun, Ouachita Parish. Students are admitted to the university by examination, certificate, or diploma. The entrance requirements are fourteen units. A three years' course in agriculture is also provided based on common school branches. The Audubon Sugar School aims to prepare men as experts in sugar growing and manufacture, and gives a five-year course of work in both engineering and agriculture, with practical instruction at the Sugar Experiment Station, Audubon Park, New Orleans. The Law School gives the degree of LL.B. after a three years' course. Master's degrees are also conferred. In 1911-1912 the enrollment of students was as follows: academic schools and colleges, 600; school of agriculture, 86, law school, 53; summer school, 595; total, 1334. The faculty consists of sixty-one members.

LOUISVILLE, UNIVERSITY OF, LOUISVILLE, KY. — A coeducational institution, founded by decree of the city council in 1837 and opened with a medical college. A law college was added in 1846, and an academic department and the college of liberal arts in 1907. The entrance requirements are based on the work of a standard high school. Courses are offered leading to the A.B. and B.S. and the corresponding graduate courses leading to the master's degrees. The medical department of the university was reorganized in 1908, and consists of the former medical department, the Kentucky School of Medicine (1850), the Louisville Medical College (1869), the Hospital College of Medicine (1873), and the Medical Department of Kentucky University (1898). The entrance requirements to the medical department are those of the Association of American Medical Colleges. The entrance requirements to the law college are high school graduation.

LOUVAIN, UNIVERSITY OF. — See BELGIUM, EDUCATION IN.

LOVELL, JAMES E. (1795-1892). — Apostle of Joseph Lancaster (*q.v.*) and organizer

of the first monitorial schools in the United States; born at Colne, Lancashire, England, and educated in a boarding school at St. Ives. He was tutor in the family of the Duke of Bedford and teacher in monitorial schools conducted by Joseph Lancaster in London and Woburn. He was induced by Lancaster to come to the United States, where he established Lancasterian schools at Philadelphia, Amherst, and New Haven. He was principal of the Lancasterian School at New Haven from 1830 to 1853. He was the author of several textbooks.

W. S. M.

See LANCASTER, JOSEPH; MONITORIAL SCHOOLS.

LOVETT, WILLIAM (1800-1877) — The English chartist who took a prominent part in the early movement for cooperation and association among workmen and later joined the Radical movement for reconciling the reformers of the middle classes with the working classes. It was while he was in Warwick Gaol (1840) that he with John Collins wrote *Chartism; a new Organization of the People, embracing a Plan for the Education and Improvement of the Peoples, politically and socially*, much of which is devoted to a plea for better educational facilities. Suspicious of government control, the authors recommend local management of schools with financial assistance from the central authority. The organization of a National Association of the United Kingdom for promoting the political and social improvement of the people was proposed, which in addition to political aims was to establish "public halls as schools for the people," which were to be used as infant, preparatory, and high schools (taking pupils from three to twelve or thirteen years of age), and as social centers for adults. Playgrounds and school gardens were to be annexed. Circulating libraries, public lectures, discussions, readings, and baths were to be organized in connection with the district hall. The orphans of members were to be educated in agricultural and industrial schools. The end of education was to be the physical, mental, moral, and political training of children. Beginning with the rudiments, the curriculum was to be gradually broadened to include geography, physical and natural phenomena, elements of applied chemistry, design, geology, and mineralogy, "the first principles of the most useful trades and occupations," horticulture and gardening. The objective methods were to be used in teaching all the subjects of the school, especially in the lower grades. "The equal and judicious development of all the faculties, and not the mere culture of the intellect," was to be the aim of instruction. The teachers were to be trained in normal schools, and in time only those who were certificated by the association were to be employed; and to attract men of genius the teachers were to

be well paid and honored in their communities. Many of the suggestions for the general organization of education show a broad grasp of its social importance, and the details of methods display a knowledge of Pestalozzi and Lancaster, and a genuine desire for improvement. In 1837 in *An Address from the Working Men's Association to the Working Classes on the Subject of National Education*, Lovett advocated an educational system to include infant schools (for children from three to six), preparatory schools (six to nine), high schools (nine to twelve), and colleges or finishing schools (for all above thirteen) to be used also as social centers. State training colleges were to be established, and no unqualified teacher was to be appointed. Local schools were to be under the control of school committees, while at the head of the system there was to be a Committee of Public Instruction, selected by Parliament, to have charge only of the financial administration. About 1849, when he retired from political work, Lovett taught anatomy and physiology, which he had studied himself, first in the district school of the association, and later in several other schools. In 1852 he wrote *Social and Political Morality, an Essay regarding the Extension of Education*, in which he develops the above scheme with greater fullness and again insists on local rather than national administration. He wrote an *Elementary Anatomy and Physiology for Schools* (1851). Lovett's *Autobiography* (entitled *Life and Struggles of William Lovett in his Pursuit of Bread, Knowledge, and Freedom*, 1876) forms a valuable source of information on the movement, in which he is recognized to have been one of the ablest leaders.

LOWE, ROBERT, VISCOUNT SHERBROOKE (1811–1892). — British statesman, born at Bingham, and educated at Winchester and Oxford (University College). He graduated in 1833, was fellow of Magdalen College, and for some time private tutor, and was called to the bar in 1842. From 1843 to 1850 he lived in Sydney, Australia, and took a prominent part in the politics of New South Wales. In 1844 he carried a resolution for a select committee to inquire into educational conditions, and in 1846 a resolution in favor of the establishment of a board of education. (See AUSTRALIA, EDUCATION IN.) On his return to England he entered Parliament on the Liberal side, and there attained a prominent position, on several occasions serving in the ministry. In 1868 he was elected the first member of the University of London. He retired from active politics in 1880. Lowe is an important figure in the history of English education, for it was as Vice-President of the Committee of Council on Education (1859–1864) that he introduced

the famous Revised Code (1861) which established the system of payment by results. Lowe had a strong belief in the superiority of examinations over inspection, denied that a science of education was possible, and aimed at an economical and mechanical system of education rather than a thoroughgoing reform. The system of payment by results continued until 1890, and it is due to Lowe that the evil pedagogical traditions from which English elementary education is just emerging were introduced, although from the administrative standpoint something was gained in establishing standards and laying the foundations of a national system. But how sincere Lowe was in his endeavors to promote public education, and how much faith he had in the Revised Code, may be seen in his address on *Primary and Classical Education*, delivered before the Philosophical Institution of Edinburgh (1867), in which the influence of Spencer is very strongly marked, more particularly in his attack on classical studies. The address carries the more conviction since Lowe was himself regarded as a good classical scholar.

LOWELL INSTITUTE, BOSTON, MASS.

— An organization founded upon the bequest of John Lowell, Jr., for "the maintenance and

support of public lectures, to be delivered in Boston, upon philosophy, natural history, the arts and sciences, or any of them, as the trustees shall, from time to time, deem expedient for the promotion of the moral, and intellectual, and physical instruction and education of the citizens of Boston." The amount of the bequest was \$250,000, and as a provision was made that 10 per cent of the income was to be added annually to the principal, the Institute has always had a great amount of wealth at its disposal. By the terms of the bequest one trustee is to be responsible for the general management, and he is to be a member of the Lowell family, so far as possible. The first trustee was John Amory Lowell who was assisted by Dr. Jeffries Wyman as curator with charge of the details of the work. The opening lecture was delivered by Edward Everett on December 31, 1839. The Institute has always been able to command the services of the most eminent scholars in their field, not only in this but in other countries. Among the lecturers the following may be mentioned: in science, Silliman, Agassiz, Tyndall, Wallace, Gerkie, G. H. Darwin; on religious subjects, Lyman Abbott, Mark Hopkins, Henry Drummond, in literature, philosophy, art, history, and education, Edward Everett, J. R. Lowell, Child, Norton, Barnard, Channing, Hale, Holmes, Lanciani, Fiske, Bryce, Eliot, Mahaffy, Ferrero. Agassiz, in fact, remained in this country as a result of his successful course at the Institute which led to the foundation of the Lawrence Scientific School. In addition to the general courses, special classes have been held in drawing from 1850 to 1879; and in science for school teachers in connection with the Boston Society for Natural History. Courses have also been given for workmen under the auspices of the Wells Memorial Workingmen's Institute. In 1872 the Lowell School of Practical Design was instituted for the promotion of industrial art. Free tuition is given in drawing and weaving in a course of three years. The courses are at present (1912) arranged in the following series: I. Free Public Lectures in Huntington Hall; II. Free Evening School for Industrial Foremen (applied science); III. Teachers' School of Science (in connection with the Boston Society of Natural History); IV. Collegiate Courses; V. Free Lectures in King's Chapel on Current Topics in Theology; VI. Free Lectures on Local Natural History. Series III and IV are part of the University Extension Courses given by a combination of all the colleges in and about Boston. The present trustee is President A. Lawrence Lowell, and the curator is William T. Sedgwick.

LÜBEN, AUGUST (1804-1874).—German schoolman; was born in Golzow, near Kustrin, Pomerania, and educated at the Seminary of Neuzelle. In 1822 he was called as assistant teacher to the seminary of Weissenfels, where he was greatly influenced in his pedagogic development by Barnisch (*q v.*). In 1825 he took charge of a village school in the province of Saxony, in connection with which he managed a very successful training class for teachers; in 1829 he became the principal of a larger school in Aschersleben; and in 1849 he was appointed to a still more important position in Merseburg. In 1858 he was called as director of the newly established Teachers' Seminary in Bremen, where he remained until his death. He published a large number of pedagogic writings, and deserves especial credit for his improvement in the teaching of nature study and of the mother tongue. His reader for *Bürgerschulen*, published in 1851 in collaboration with Naeke, was very widely used. From 1857 until the time of his death, he edited the *Pädagogischer Jahresbericht (Educational Annual)*, as well as from 1861 on, the pedagogic magazine *Der praktische Schulmann (The Practical Schoolman)*. Among his works may be mentioned also his *Anweisung zu einem methodischen Unterricht in der Pflanzenkunde (Methods of Teaching Botany)*, Halle, 1832, followed by a similar work for zoology and anthropology (1836), and his *Einführung in die deutsche Literatur (Introduction into German Literature)*, the tenth volume of which was published in three volumes in Leipzig, 1892-1896.

F. M.

LUBINUS, EILHARD, or EILERT LÜBEN (1565-1621).—A German scholar and educationist, son of a pastor in the duchy of Oldenburg, who studied at Leipzig and other universities, and in 1595 became Professor of Poetry in the University of Rostock. In 1605 he transferred to the Chair of Theology in the same university, and died in 1621. (See *Allgemeine Deutsche Biog.*, Band XIX, p. 331.) Lubinus published many works, including editions of the *Epistolæ* of Apollonius, the *De Vanitate Mundi* of Bernard, the Greek Anthology, the *Epistolæ* of Hippocrates, the works

of Horace and Juvenal, the *Dionysiaca* of Nonnus, Persius, the *Epistolæ* of Phalaris. He wrote a *Clavis Græcæ Lingvæ cum Sententiis Græcis Latine explicatis*, an edition of which was published by the London Stationers' Company in 1620. The *Medulla Lingvæ Græcæ* was published in London as late as 1745.

As an educationist, however, Lubinus is now chiefly remembered for his remarkable epistolary Discourse, prefixed to his edition of the New Testament (1614). This was printed in English by Samuel Hartlib in his small collection of tracts on *The True and Readie Way to learne the Latine Tongue*, 1654. (See HARTLIB, SAMUEL.) It was in this Discourse, that realistic education of the seventeenth century received its earliest, clearest statement; and, as Mr Quick suggested, Comenius probably took from it the idea of an illustrated *Orbis pictus*. (Quick, R. H., *Educational Reformers*, p. 166.) Lubinus says that living creatures ought to be painted and shown to children; and only those known to children should at first be given the Latin names (See also KINNER, CYPRIAN.) All terms or words, he further says, of things which can be seen and painted can be taken from the *Nomenclator* of Hadrianus Junius (*q.v.*), provided those are first chosen which are already known by the child. Lubinus is thus the father of systematic pictorial illustration as an educational method. F. W.

LUCA DE BORGO SAN SEPOLCRO.—

See PACIULO.

LUCIAN OF ANTIOCH.—Presbyter and martyr, holds a place in the history of pedagogy, not as formulating pedagogical principles, but as giving the characteristic tendency of what is known as the School of Antioch. The first known teacher of that school was Malchion, who seems to have combined general education with specifically theological instruction, and who confuted Paul of Samosata, Bishop of Antioch, and brought about his deposition. Whether Lucian shared the opinions of Paul at the time cannot be determined. A creed written by Lucian, or attributed to him, shows little resemblance to the teachings of Paul. It is highly probable that he left the communion of the Church about the time Paul was deposed, and remained out of communion under the next successors of that prelate, or from about 275 A. D. to 303. But in spite of his highly equivocal ecclesiastical position, he became head of the local theological school. His great contribution to the work of that institution was insistence upon what are now recognized as the fundamental principles of scientific exegesis, or the literal and grammatical interpretation as opposed to the allegorical method at that

time generally in vogue in the Church. This spirit of scientific exegesis makes the work of the Antiochian exegetes of permanent worth. In speculative theology Lucian's efforts were by no means so fortunate. Arius, Eusebius of Nicomedia, and several other early leaders of Arianism were trained by Lucian. Of the works of this great teacher only fragments remain. His edition of the *Septuagint* was long widely used in the churches of Constantinople, Asia Minor, and Antioch. It does not exist to-day as a whole, and its reconstruction is a task yet unperformed. Of his exegetical work only fragments remain, but his principles are abundantly illustrated in the still valuable commentaries of Chrysostom and Theodore of Mopsuestia. Lucian died as a martyr in Nicomedia, Jan. 7, 312.

The material for the life of Lucian is singularly scanty. About all that is known has been gathered by A. Harnack in his article in the *Realencyclopaedie für protestantische Theologie*. Accounts may be found in the various histories of the Christian Church. His literary remains are to be found in Routh, *Reliquæ sacræ*, Vol. IV. J. C. A., Jr.

LUDER, PETER (c. 1415–c. 1474) — German humanist, chiefly worthy of note as the first humanist lecturer in any German university. He had himself studied at the University of Heidelberg. He had spent much time in Italy as a student at Ferrara under Guarino, had made a voyage to Greece, and had studied medicine at Padua. In 1456 he was appointed Professor of Poetry and Rhetoric at Heidelberg, and delivered an inaugural address in praise of the humanistic studies, defending them against charges of immoral tendencies. He met with opposition both of the students and the clergy. He next appeared at Erfurt in 1460, and in 1462 at Leipzig. After a short time at Basel (1464), he is lost sight of in the retinue of Duke Sigismund of Austria.

Paulsen, Fr. *Geschichte des gelehrten Unterrichts*. (Leipzig, 1896.)

LUDIMAGISTER (*Ludi-Magister*, master of a school) — The term used in Rome for the teacher of an elementary school (*ludus*), also called *literator*. Only the rudiments of reading, writing, and calculation were taught here. The term appears again in the English schools of the sixteenth century, when *ludimagister* is synonymous with *archididasculus* and Headmaster. In Germany the term *ludirector* is found at the same period.

See ROMAN EDUCATION.

LUNCHES AND LUNCHROOMS IN SCHOOLS.—(See also FOOD AND FEEDING OF SCHOOL CHILDREN for the dietetic aspect of the subject.) The need of school lunches is now

so generally recognized that few large high schools are without them, and the elementary schools are beginning to take up the problem in earnest. When the distance between home and school makes the noon luncheon at home impossible for the child, there is scarcely a justifiable argument against its provision at school. Too little care is given to lunch carried by the children even from the better homes, its daily preparation being universally conceded to be the most irksome of all household duties, and the carrying of it so disagreeable to the child that no lunch at all is preferable. If money is given to buy lunch with unguided choice, it is spent at alluring push-carts for unwholesome, even poisonous, hot meat sandwiches and for ice-cream cones and pickles. It is wise and often necessary to make outside purchase impossible, as has been done in many schools.

High Schools — The problem of providing high school lunches has been met in most schools in the following way: the Board of Education provides the rooms and permanent equipment, — chairs, tables, ranges, hot water, gas, etc., — and either awards the concession to some individual or club, thus receiving a suitable per cent on the investment, as Chicago does in her nineteen high schools, or appoints at a salary a woman who takes charge of it as of any other department of the school, and works out intelligently the problem of providing at minimum cost the best of food in hygienic and appetizing variety. This method is followed in St. Louis and Indianapolis. With the first method the profit goes to an individual or club, and carries with it the temptation to sacrifice quality for gain. With the second, the profit that accrues is used for improved equipment and facilities, or allowed to grow as a school fund for whatever use the Board may specify, or is taken periodically as the basis for reduction in prices charged. A combination of the first and last ways has been used in the Manual Training High School of Indianapolis, until in two years the tableware was greatly improved, with an astonishing effect upon the manners of the children at table; and the price of luncheon was reduced almost half. The medium of exchange in use there is an aluminum check of three-cent value. This buys any of six or eight kinds of sandwiches, generous in size and of excellent quality, salad, sauce, or fresh fruit, a large bowl of soup with fresh toast, any hot vegetable, coffee, cocoa, milk, pie, or ice-cream. Two of these checks buy hot roast, dressing and gravy, finer salads with wafers, or an ample bowl of shredded wheat and cream. In St. Louis a five-cent check buys a combination, such as sandwich and milk, salad and wafers, individual baked beans with bread and butter, etc. Nine or ten cents at these places buys a much better luncheon than most children ever bring from home. In the Englewood (Ill.) high school, which is

excellently conducted by a woman's club, the average cost of luncheon to the child is twelve cents. In these schools every article of food is of superior quality, and the cooking and cleanliness are above reproach. The general plan for getting the work done is to employ competent women at good wages in the kitchen, and let students assist in serving, with pay according to time given. Each person eating gets his own dishes and food, paying for the latter as he takes it, and after eating carries his dishes and any paper or refuse to receptacles for these, and the bare tables are washed for the second sitting. Nowhere is the buying of food compulsory. Children may bring all or part of their luncheon and use tables and dishes without charge; but in order to make it successful it is well to have some restriction upon outside buying by avoiding the open noon hour and making the lunchroom attractive and the quality of food irresistible. The frequent requests for pickles, bakers' pastries, etc., soon die out, and the absence of headaches and afternoon languor is acknowledged.

Elementary Schools. — The problem of school lunches is only beginning to be solved in elementary schools, where the longer recess and shorter distance tend to make it less serious. During the present year (1911) the Board of Education of Chicago has begun an experiment to provide suitable noonday luncheons for children whose mothers are away from home during the day. The plan is being tried in three centers. For one cent the child is provided with (1) a sandwich of bread and jam or bread and syrup, and a glass of milk, or (2) a bowl of bean or pea soup with bread. A woman is employed to prepare and serve this, and whatever cost exceeds the sum brought by the children is borne by the Board of Education. One school in the poorer districts of Indianapolis has successfully furnished a bowl of soup and toast at one cent. A woman living near does the cooking, friends give dishes, and the children do the serving under direction of teachers. It makes a social hour, and improvement is noticeable in the manners, the physical appearance of the children, and in their ability to do the afternoon work. E. K. C.

LUND, UNIVERSITY OF. — See SWEDEN, EDUCATION IN.

LUPSET, THOMAS (c. 1498–1530). — Scholar and protégé of Dean Colet (*q.v.*), who placed him in St. Paul's School and later maintained him at Pembroke Hall, Cambridge. In 1515 Lupset went to Italy and on his return graduated B.A. at Paris. Settling at Oxford in 1521, he lectured on Cardinal Wolsey's foundation on the humanities and Greek. From 1526 onwards he held several rectories. Lupset belonged to the circle which included Colet, More, Erasmus, and Linacre. He prepared and corrected work for the press of

Erasmus, Linaere (*Galen*), and More (*Utopia*, 2d ed.). In a letter to Colet (1512) Erasmus says of him, "Thomas Lupset, your true pupil, is both useful and agreeable to me by his daily companionship, and the assistance he lends me in these corrections."

LUTHER COLLEGE, DECORAH, IA. — Opened in 1861 near La Crosse, Wis., and moved to its present location in 1862. It is under the control of the Norwegian Lutheran Synod. A four-year preparatory department is maintained in addition to the college. Candidates are admitted on completion of a four-year preparatory course. The degree of A.B. is conferred. The faculty consists of sixteen members.

LUTHER, MARTIN (1483-1546). — The great German Protestant reformer and advocate of the development of an organization of schools and the reformation of school subjects and school work. He was born at Eisleben, and brought up at Mansfeld in Saxony. In 1497 he went to school at Magdeburg, and then to Eisenach. He went to the University of Erfurt in 1501. In 1505 he entered the Augustinian Monastery at Erfurt. In 1508 Luther was called to become a professor in the newly established University of Wittenberg, where his duties were to lecture on the *Dialectics* and *Physics* of Aristotle. In 1509 he became a Bachelor of Theology, and thus was entitled to lecture on the text of the Holy Scriptures; and in the same year he was invited to Erfurt to lecture to higher students in theology. In 1511 Luther went to Rome on a mission connected with Erfurt, and the experiences derived from this journey were highly educative. In 1512 he became sub-prior of the monastery at Wittenberg, and in the same year he took the degree of Doctor of Theology in the University of Wittenberg, and became professor of theology — then devoting his whole mind to scriptural studies — first to the Psalms, then to the Epistle to the Romans, learning Greek for that purpose. He read much of Augustine, and of the recent writers, especially Tauler. In 1517 he issued his Ninety-Five Theses with regard to Indulgences. These were placed on the door of the Castle Church at Wittenberg, this act being regarded as the starting-point of the Reformation. In 1520 a Bull was issued against Luther, and in 1521, at the Diet of Worms, he was called upon to recant. He refused to do anything against conscience. Called upon, accordingly, to help to build anew the Church, Luther set upon the work of translating the whole of the Scriptures into German. The New Testament was published in 1522; the canonical books of the Old

Testament were finished in 1532, and the Apocrypha in 1534, in which year the translation of the whole Bible into the vernacular first appeared.

Revolutions in Church doctrine and government have usually been accompanied by changes in educational systems. Luther saw the necessity of a reformation of schools, as soon as he became conscious of the need for a reformation of the Church, since the religious instruction of the child in the family and in the school was the very basis for the continuity of the new faith. After his translation of the New Testament, he prepared his *Larger* and *Smaller Catechisms*, which were issued in 1529. (See *CATECHISM*.) He was made miserable by the fact that "the common people know nothing at all of Christian doctrines, and many pastors are well-nigh unskilled and incapable of teaching." In his preface to the *Larger Catechism* he insists that it is the duty of the father of each household at least once a week to question his children and servants in this Catechism. Luther thus is the pioneer of Protestant household instruction in religious subjects. Luther's Hymns, in the collection known as *Geistliches Gesangbuch* (1525), containing thirty-two hymns, of which twenty-four were by Luther, was composed for the use of schoolboys as choristers. His hymn beginning *Ein feste Burg ist unser Gott* is a Christian classic for both children and adults. Luther is of profound significance in his insistence on the educational and religious possibilities of family life, and the idea of the good housewife and good men of the house, and good house government with Protestant religious training has sunk into the German consciousness as one of the great traditions of Lutheran influence.

Luther's principal works bearing directly on schools and education are the *Letter to the Mayors and Aldermen of all the Cities in Behalf of Christian Schools* (1524), and the *Sermon on the Duty of Sending Children to School* (1530). He advocates the necessity of schools for religion and for supplying preachers, jurists, scribes, physicians, schoolmasters, as well as rulers. But he would have all children, boys and girls, go to school for an hour or two a day, and still leave them time to learn to do business work and housework as well. So necessary is schooling that Luther advocated compulsion. "For if magistrates may compel their sturdy subjects to handle musket and pike in war, how much more should they compel subjects to keep their children at school. For there is a worse war to be waged with the devil, who is busied secretly thus to impoverish towns and principality through the absence of education." Therefore magistrates should be warned to keep all suitable boys at school. "To give money for this purpose is, rightly speaking, to give money to churches. This is not releasing souls from purgatory; it is preventing souls from going anywhere but to

heaven." But Luther does not only base his arguments for the need of schools on religious grounds, for he says, "Were there neither soul, nor heaven, nor hell, it would be still necessary to have schools for the sake of affairs here below," and again, "The highest welfare, safety and power of a city consists in able, learned, wise, upright, cultivated citizens, who can secure, preserve and utilize every treasure and advantage." Education, accordingly, was conceived by him as an essential preparation for the ordinary duties of life in the home, vocation, civic life, and the church. It is not surprising, then, to find how highly Luther appreciates the services of the teacher. In one of his sermons he says: "A diligent devoted school-teacher, who faith fully trains and teaches boys can never receive an adequate reward, and no money is sufficient to pay the debt you owe him." He says elsewhere, "If I were not a preacher, there is no other calling on earth I would have rather than that of schoolmaster. We must not consider how the world esteems it and rewards it, but how God looks upon it." Luther recognizes the disciplinary value of teaching on the schoolmaster himself, and says he would wish to see all preachers go through the experience of schoolmastering before taking up that office. "When one has taught about ten years, then he can give up teaching with a good conscience."

Luther advocates the learning of the classical languages. God has not caused the Scriptures to be written in Hebrew and Greek in vain. Where these languages flourish, the power of the prince of darkness will be destroyed, and the glosses of scholastics become useless. Languages are best learned by practice. We learn the vernacular from oral speech at home, in the market, and in the pulpit better than through books. Grammatical knowledge is important, but the knowledge of subject matter is essential, and particularly in the teacher. Mathematics should be taught at the university stage. Luther combated astrology, pointing out that Esau and Jacob were born under the same constellation, and yet were so dissimilar in disposition. History is an important study, teaching us through examples and illustrations. What philosophy, founded on reason, discloses as helpful to noble living, history shows forth in living example. Out of stories and histories, nearly all laws, arts, and examples of wisdom, comfort, fear, strength, courage, instruction arise. Luther urges the study of dialectic, as showing order and reason, and the grounds of forming judgments. Rhetoric should be studied, so that we may be effective in putting points to others. Dialectic, he says, is proper to the reason; rhetoric as an influence on the will. Music is a beautiful, noble gift of God, near in its educative position to theology. "Unless a schoolmaster sings," says Luther, "I think little of him." It has been claimed for Luther that he supported

nature study. For he argued that "now we look forward to attain the knowledge again of the created world, which was lost by Adam's Fall. Now we regard more rightly the creatures of God than we did in the old religion." As to physical exercises, Luther says, "These two exercises and pastimes please me best of all, viz. music and the tournament with fencing, wrestling, etc. The former drives away anxiety from the heart and gloomy thoughts. The latter renders the limbs of the body elegant, fit, and well-proportioned, and keeps it in health and elasticity, etc."

Luther thus touches on many points of educational theory and practice. All his education is subordinate to the religious *motif*, yet it includes the greatest questions, religious teaching, family education, the vernacular. As the translator of the Scriptures into German, the writer of the German Catechism, the writer of German hymns, and, in pursuance of these aims, the teacher and trainer of his own children, Luther stands out as the Prophet of German popular education, and the inspirer of princes and magistrates in the erection of popular schools. His sympathetic attraction to teaching is shown by his words: "Let no man think himself so intelligent that he can despise children's play. When Christ wished to teach man, He had to become a man. If we are to train children, then we must become children with them." F. W.

LUTHERAN CHURCH AND EDUCATION IN THE UNITED STATES.—

Certain ecclesiastical bodies, because of their attitude toward public education and their belief in parochial systems of schools, deserve special notice.

Among the Protestant denominations, the Lutheran is the most conspicuous of these.

Historical Development.—When the Germans began to settle in America in larger numbers during the eighteenth century, they at once provided for the schooling of their children. Every German sect had its parochial schools. Wherever a community erected a house of worship, it immediately also established a school. The ministers were frequently the school teachers. Some schools had professional teachers, who had come over from Europe, and some of these were men of a superior education, who soon became the leading spirits of their colonies, as John Ulmer in Maine, who led the German soldiers in the siege of Louisburg. The Palatine schoolmaster, John Thomas Schley, who was the mainstay of school, church, and community in Frederick, Md., Holzko in Virginia, Arndt in North Carolina, and above all Franz Daniel Pastorius, the scholar and leader of Germantown, were other eminent pioneer teachers. The Swedish Lutheran congregation at Christiansburg in 1699 had a school and a teacher. In the instructions given in 1749 to M. Acrelius, as "Probst" of the Swedish Lutheran Church in America, he was enjoined: "As soon after his arrival in America as he might familiarize himself with conditions there, he should endeavor to institute a school for children in each congregation."

The activities of the Lutheran and of other German religious bodies is summarized in the historical sections of the article on Pennsylvania. (See also GERMAN INFLUENCE ON AMERICAN EDUCATION.) The Lutheran was the most important of these German sects. Their activity has been continuous. H. M. Muehlenberg and Schlatter, Kunze, Helmuth, and Schmidt, who had once been students of Francke at Halle, did much to improve the cause of parochial schools. At the first meeting of the Ministerium of Pennsylvania (1748), Brunnholtz made a full report on "The Condition of the Schools." In 1750 flourishing schools are reported in all the congregations except one. In 1796 the steps taken by the Assembly toward the introduction of "free schools" aroused the fears of the Ministerium that its parochial schools might suffer injury thereby, and a committee was appointed to address a petition to the Assembly on the subject. In 1804, 26 congregations report 89 schools; in 1813, 164 schools are reported by 52 pastors, in 1820, 206 parochial schools in 84 congregations. The American public school system in course of time gradually absorbed the parochial schools of the older German churches in the East. Still, up to the third quarter of the century, many excellent parochial schools are found in the Ministerium of Pennsylvania and New York. The mother congregation, St Michael's and Zion's, in Philadelphia, was particularly active in this field. In 1744 John F. Vigera, an excel-

lent teacher, is mentioned as its schoolmaster. In 1761 the schoolhouse on Cherry Street was opened. In 1800 the congregation had four schools, with 250 children. In 1870 the congregation had about 1000 children in its parochial schools in different parts of the city. Among the schoolmasters were Schmauk, Haas, Lang, Schnabel. In the New York Ministerium the number of parochial schools is considerably larger in proportion than in Pennsylvania. The serious difficulty with which the parochial school system had to contend in these two oldest synods is the lack of a teachers' seminary. In 1871 a society was organized in New York for the founding of such an institution, but the plan finally failed from lack of proper support.

Development of Present System.—The Lutheran parochial school system reached its greatest development in America in the North Central states within the congregations affiliated with the Lutheran synods of Missouri, Wisconsin, Ohio, and Iowa. A twofold purpose actuated the members of this church in founding and maintaining parochial schools: first, the desire to bring up their children in the faith of their church, and second, the wish to maintain and transmit their mother tongue and German culture. Schools were therefore organized, if possible, in every congregation or parish, and it was considered a function incumbent on the pastor to lead in the establishment of schools within his parish, and not only to superintend, but also, circumstances not allowing the appointment of a professional teacher, to impart instruction himself.

The individual congregation owns its parochial school and controls it through a school board elected by the congregation, of which the pastor as a rule is an *ex officio* member. The teachers are usually called by the congregations without a time limit and with a fixed salary. They also serve as organists and musical directors of the congregation. The financial expenses of the school are covered by fixed and graded tuition out of the congregation treasury or by voluntary contribution. The school year comprises from thirty-five to forty-eight weeks, with holidays and summer vacations. In schools where several teachers are employed, the curriculum follows as far as possible that of the public schools, the aim being to equal the course of the seventh grade in the public schools. Male teachers are employed almost exclusively. In some schools the primary department is in charge of a lady teacher. Some congregations maintain a parochial school during the summer months or only on Saturdays, instruction being given as a rule only in religion and German, the children attending the public schools during the remainder of the school year. Courses of study for the different grades have been published, comprising instruction in religion, English, German, arithmetic, history, geography, singing, drawing. The teachers of each synodical

LUTHERAN CHURCH

district hold regular monthly or quarterly conferences or institutes, and also a yearly general teachers' meeting.

Since 1866 the Missouri synod publishes the *Lutherische Schulblatt*, a monthly, edited by the faculty of the Addison Teachers' Seminary and published at St. Louis, Mo. In 1876 the Wisconsin synod began to publish the *Lutherische Schulzeitung*, edited by Dr. F. W. A. Notz, Watertown, Wis., till 1894, and by the faculty of the Martin Luther College, New Ulm, Minn., till 1905.

In order to supply well educated and trained teachers who should be in close touch with the interests of the Lutheran Church, Lutheran normal schools were established. Pioneer work along this line was done by the Missouri synod. As the number of parochial schools and interest in good schools grew, several Lutheran synods established and maintained normal schools, either independent of or in connection with other educational institutions. These "teachers' seminaries" combine certain features of the German type of *Lehrerseminar* with the educational system obtaining in our American normal schools. The full course in the preparatory and in the seminary departments embraces five or six years.

In 1890 the parochial school question became a leading political issue in Wisconsin and in Illinois. The legislature of Wisconsin at the session in 1889 enacted the so-called "Bennett Law" (so named from the member who introduced the bill), ch. 519 of the Laws of Wisconsin, which had been passed without the knowledge of those most interested against it. The chief provisions were. Compulsory attendance of the child for a period not less than twelve nor more than twenty-four weeks in each year, to be fixed annually, in advance of Sept. 1, by the school board in each district or city; that such attendance should be consecutive during such portion of the compulsory period as the board should determine; while excuse for non-attendance was required to be made out to the satisfaction of that board as the sole and final judge, and concluded these provisions with the following section: "No school shall be regarded as a school under this act, unless there shall be taught therein as part of the elementary education of children, reading, writing, arithmetic, and United States history in the English language." Here the statute confessedly denounced as no school within its purview any private school which did not conform to these requirements. This legislation asserted as fundamental doctrine, first, the right of a public authority to prescribe the course and subjects of instruction in schools maintained as purely private establishments, without public cost, by parents who seek to educate their children after the dictates of conscience, and, secondly, the right of the State to intervene between any parent and child, and, *in loco parentum*, to assume and

LUTHERAN CHURCH

control the education of all children. A bitter political controversy arose. The Lutherans, who had 380 parochial schools with 20,000 pupils in Wisconsin, and the Roman Catholics, with equally large interests involved, vigorously protested against this law as interfering with parental relation, personal liberty, and matters of conscience. In the election of 1892 the party that had passed the law was overwhelmingly defeated and the law was repealed. A compulsory attendance law was then brought forth, which has since given general satisfaction. (*Lutherische Schulzeitung*, Vol. XII ff., and *The Forum*, Vol. XII, No. 2; W F Vilas, *The Bennett Law in Wisconsin*.)

At the World's Fair at St. Louis 460 male and 37 female teachers of the Missouri synod made an exhibit of the work of their parochial school pupils in English language, United States history, geography, arithmetic, religion, German language, physiology, zoology, botany, general history, penmanship in English and German, drawing. The exhibit was awarded a gold medal. The members of the jury for elementary school work stated that the written work in this synodical exhibit was unsurpassed. As worthy of special merit the German language work was mentioned, and the manner in which the two parallel languages, English and German, were successfully taught and the difficulties overcome. The growth and development of the parochial schools within the Missouri synod was as follows:—

YEAR	SCHOOLS	PASTORS	INSTRUCTORS	
			Teachers	Pupils
1818	14	9	5	508
1858	113	62	51	4,974
1868	367	171	196	22,687
1872	475	224	251	25,300

Lutheran pastors who went to Ohio in 1805 and in the following years began at once to organize parochial schools. In 1815 there were twenty-one parish schools in that state; in 1817, forty-eight; in 1819, fifty-seven.

Present Status.—In the year 1910 the parochial school work of the Evangelical Lutheran Church in America comprised. 4862 parish schools, 3492 teachers, 244,198 pupils, which were distributed among the following synods: synodical conference. 2655 parish schools, 1386 teachers, 132,927 pupils; general council: 594 parish schools, 748 teachers, 26,588 pupils; general synod: 36 parish schools, 3 teachers, 1100 pupils; independent synods: 1577 parish schools, 1355 teachers, 85,583 pupils

There are several normal schools maintained by Lutheran synods in the United States. In 1854 the Missouri synod founded a teachers' seminary in Milwaukee, Wis., which was transferred to Addison, Ill., in 1864. During

LUTHERAN CHURCH

the past twenty years, 719 teachers have been educated there. Following are the Lutheran normal schools in America: Teachers' Seminary, Addison, Ill., 11 instructors, 175 students, 6 classes; Teachers' Seminary, Seward, Neb., 8 instructors, 117 students; Martin Luther College, New Ulm, Minn., 8 professors, 118 students; Lutheran Normal School, Sioux Falls, S.D., 8 instructors, 147 students; Lutheran Normal School, Madison, Minn., 182 students, 6 teachers; Teachers' Seminary, Woodville, Ohio, 71 students, 5 teachers; Wartburg Teachers' Seminary, Waverly, Ia., 84 students, 5 teachers.

Higher Education.—No other church, in proportion to its membership and resources, has established so many colleges and seminaries in the United States as the Lutheran Church. The Lutheran educational institutions number 126, having property valued at \$9,667,800, endowments amounting to \$3,104,200, with 505,110 volumes in their libraries, employing 1049 professors, having 16,731 students.

LUTHERAN CHURCH

Theological Seminaries, 26, with property valued at \$2,196,300; endowments amounting to \$1,100,100, having 163,420 volumes in their libraries, employing 92 professors, and having 1144 students.

Academies, 53; value of property, \$1,907,000; amounts of endowment, \$96,500; volumes in libraries, 59,610; professors, 382, students, 6730.

Ladies' Colleges and Seminaries, 8, value of property, \$760,000; amount of endowment, \$1000; volumes in libraries, 4850; professors, 104; students, 927.

Colleges, 39, with property valued at \$4,804,500; amount of endowments, \$1,906,000; volumes in libraries, 277,230; employing 471 professors and having 4950 students in college departments and 2980 students in other departments. The majority of the colleges are open to both sexes. But there are a few institutions devoted exclusively to the higher education of women. The two oldest Lutheran Colleges in America are Pennsylvania College, Gettysburg, Pa., founded in 1832, and Concordia College, Ft. Wayne, Ind., founded in 1839.

LUXEMBURG, EDUCATION IN.—The Grand Duchy of Luxemburg comprises an area of about 1000 square miles on the east side of the Rhine, and a population of 246,500 (1905). The religion of the state is Roman Catholic; but liberty of conscience is respected, and the few dissentients, about 2269 Protestants, 1200 Jews, and 240 members of other sects, are protected in all rights and privileges. In the eleventh century a county or earldom within the German Empire, Luxemburg was constituted a grand duchy in 1354, and during the five centuries following, the sovereignty over the state was determined by the course of empire in central and western Europe. In the latter part of the fifteenth century Luxemburg was a possession of the House of Austria; after the death of Charles V the country was ceded to Spain; it came again under Austrian dominion at the beginning of the eighteenth century, and during the wars of the Revolution was annexed to France. The congress of Vienna assigned the grand duchy to the King of the Netherlands, a relation broken up by the revolt of 1830, but restored in 1839; finally by the treaty of London, 1867, the grand duchy was declared neutral territory, and at the death of the King of the Netherlands in 1890, by reason of the Salic law its control passed to Adolph, Duke of Nassau.

The educational history of the country prior to 1839 is identified with that of the states with which it has been successively united.

By the constitution of the grand duchy (bearing date Oct. 17, 1868), public education is placed under the general supervision of the government, and is regulated by legislative acts and by official decrees emanating from the Grand Duke. Primary education forms a department in the Ministry of the Interior under the charge of a Director-General, who is assisted by a Council of Public Instruction and a permanent committee formed from the members of the council.

The system of primary education is based upon the law of July 26, 1843. Subsequent modifying laws are: the laws of July 20, 1869, July 6, 1876, Jan. 2, 1879, providing better conditions for teachers; the law of Apr. 23, 1878, pertaining to the establishment of higher primary schools, and laws of Apr. 20, 1881, and of July 6, 1898, applicable to the entire system.

Every commune (city or rural) is required to establish one or more schools according to the population, and provide the suitable sites and buildings. From the first the State has borne part of the current expenses of the schools, and by ducal order of May 23, 1907,

the minimum amount of this aid is placed at 40 per cent of the salary assured to a teacher by the commune. The law of 1881 made primary instruction obligatory for all children from the ages of six to twelve years. Under certain conditions exemption may be claimed for a child at ten years of age, and communes may also extend the compulsory period to thirteen years of age. The primary schools are not free, the local expense for their maintenance being borne by the communal treasury and tuition fees in fixed proportion; the fees are, however, remitted in case of need and the amount met by increase in the communal appropriation.

The course of study for primary schools prescribed by law includes: religion and morals, German language and French language, arithmetic, with the system of weights and measures, elements of geography and of natural history, singing, and for girls, needlework. This program may be extended to include elementary sciences, physical and natural, linear drawing, bookkeeping, and gymnastics.

The law of 1843 required that the religious instruction in the schools should be given by the clergy of the respective denominations, but subsequent laws provide that the subject may be taught by the regular teachers with the consent of the local authorities and under the direction of the clergy.

The Director-General of primary education is appointed by the Grand Duke, as are all the chief officials of the service. The advisory council consists of the bishop, three appointed members, the inspectors of primary schools, and the director of the normal school. The government inspectors for this service are a principal inspector and one inspector for each of the six divisions (*arrondissements*) of the duchy. The salary of the principal inspectors ranges from 5360 to 5650 frs. (\$1072 to \$1130), that of the subordinate inspectors from 3526 to 3825 frs. (\$705 to \$765). The local supervision of schools is intrusted to committees consisting in each case of the *bourgemestre* (mayor), the curé, and one or more members of the civil council (elective) according to the population.

Teachers are appointed by the communal authorities, acting in concert with the inspector and with the approval of the Director-General. Candidates for appointment must have a teacher's certificate (*brevet de capacité*) from the Council of Public Instruction, and testimonials of character from the local authorities. The certificate of the lowest order entitles the holder to temporary appointment; permanent appointment can only be obtained after five years' experience and special examination. The teaching force is classified in four grades with salaries for lay teachers ranging by regular increments from 1200 to 2100 frs. (\$240 to \$420) for men; from 1000 to 1500 frs. (\$200 to \$300) for women. Lay teachers may also have the right to a residence or a money equivalent,

at least 250 frs. annually. After five years' service male teachers receive an additional sum of 100 frs. from the State, which rises by periodical increases to a maximum of 800 frs. after thirty years' service. The salaries of women teachers are supplemented in the same way by increments ranging from 75 frs. to 600 frs.

Communes are authorized to establish higher primary schools to which pupils may be admitted at twelve years of age for a course of two or three years' duration. The teachers of the higher primary schools must be graduates of a secondary school, i.e. gymnasium or the higher industrial and commercial school. Communes may also maintain infant schools (school gardens) for children under school age and continuation schools (held in the evening or on Sunday) for adults.

The department of primary education includes the state normal school, which was established in 1817. It is organized in two separate sections, one for young men, the other for young women; the former are day students only. The government offers thirty scholarships for young men and fifteen for young women, which cover the expense in this institution. The number of primary schools is adequate for the needs of the population, and practically all children in the grand duchy receive elementary instruction. The latest statistics pertaining to this department are as follows:—

STATISTICS OF PUBLIC PRIMARY SCHOOLS,
1908

SCHOOLS	NUMBER OF SCHOOLS	PUPILS			TEACHERS			
		Total	Male	Female	Total	Male	Female	
							Lay	Nun
Higher primary schools .	22	827	498	329	—	14	8	
Ordinary primary schools .	862	33,885	17,338	16,547	865	459	222	184
Infant schools .	32	1,661	—	—	32	—	11	21
Schools for adults .	800 ¹	10,709	4,998	5,711				

According to the latest official statistics (1908), the annual expenditure for primary education amounted to 1,771,824 francs (\$354,364.80). Of this total 1,548,318 francs (\$309,663.60), or 87½ per cent, was for the ordinary primary schools.

In addition to the schools above considered,

¹ Of this total 440 were for men, 360 for women. They are evening and Sabbath day classes, lasting about five months in the year; in the case of the classes for women the courses pertain very generally to the domestic arts; in those for men, drawing is almost always a pronounced feature.

the State maintains an institute for deaf-mutes, an institute for the blind at Berbourg, and one for the feeble-minded at Betzdorf.

Higher Education.—The institutions for higher education in Luxembourg date from a law of July 23, 1848; but have been modified by subsequent laws. The most important of these institutions is the Athenæum of Luxembourg, comprising a gymnasium (classical school) and a school of commerce and industry. The latter, which was originally a section of the gymnasium, was separately organized by a law of Mar. 28, 1892. There are also gymnasia at Diekirch and Echternach, which were formerly of inferior grade (progymnasia), but received complete organization by law of 1900, which provided also for the addition of industrial sections.

The gymnasia are classical schools following German models; a law of 1908 provided for dual courses of instruction after the second year, allowing choice between the classical course and a modern course comprising living languages and science. Pupils are admitted to the lowest class of the gymnasium proper or to the industrial sections at twelve years of age. The course of instruction occupies six years.

For technical education there is a school of commerce and industry at Esch-sur-l'Alzette, dating from a law of June 16, 1901, and a school for artisans authorized by a law of Mar. 14, 1896; also a school of agriculture with an experiment station at Ettelbruck, created by law of Feb. 28, 1883.

The charge for tuition in the gymnasia ranges from forty francs to sixty francs per annum. In the school for artisans fees are limited to forty francs a year, and are often remitted.

The state appropriations for these higher institutions are administered by the director-general of finances, and their internal affairs by special committees, appointed, as are the directors and professors, by the Grand Duke.

The Luxembourg Athenæum in 1908 registered 493 students in the gymnasium and 406 in the industrial school; the gymnasium of Diekirch the same year had 159 students in the classical, and 50 in the modern section.

The course of instruction in the gymnasium prepares for the examination leading to the diploma for professors of secondary education, and also for matriculation in the universities of neighboring countries, Luxembourg having no university. In 1910-1911 there were fifty-nine students from the grand duchy registered in French universities, and sixty-one in those of Germany. The fine arts are fostered by the reigning family, and the Conservatory of Music at Luxembourg is celebrated. A. T. S.

LYCEE.—See FRANCE, EDUCATION IN; LYCEUM; GYMNASIUM.

LYCEUM MOVEMENT IN THE UNITED STATES.—Josiah Holbrook (*q.v.*), who started the lyceum movement at Millbury, Mass., in 1826, stated its purposes as follows: (1) The improvement of the common schools; (2) the formation of lecture courses and the establishment of classes for the education of adults; and (3) the organization of libraries and museums. The first purpose became the chief feature of the American Lyceum Association (*q.v.*). The chief outcome of the lyceum movement *per se* was the organization of lecture courses in many cities and towns and the establishment of libraries. By 1831 there were 900 towns in the United States with local lyceum organizations. Between 1825 and 1850 most of the public lectures in the country were under such local organizations; and this feature of the lyceum movement continued prominent down to 1880. Wendell Phillips, one of the early lyceum lecturers, is said to have given his lecture on "The Lost Arts" two thousand times before lyceum audiences. Lowell Institute (*q.v.*) in Boston and the Brooklyn Institute (*q.v.*), both of which grew out of the lyceum movement, are still in existence.

Many town libraries were also formed by local lyceum associations. The Mercantile Library Association of Boston, composed of merchants and clerks in a local lyceum association, as well as the libraries of the mechanics institutes in many American cities, and the societies for the diffusion of useful knowledge interested in lecture courses and the establishment of libraries and museums, were organized and directed by the men connected with the American Lyceum Association. In recent times this movement has been replaced by the Chautauqua movement and the University Extension (*qq.v.*). In some respects public lecturing has become more closely allied with public amusement than with education. At present in the United States there are about 12,000 towns and cities organized as lyceum centers. More than 40 lyceum bureaus furnish specialists who devote all or part of their time to this purpose, more than 750 of whom are organized with the International Lyceum Association. W. S. M.

LYCURGUS.—The Spartan lawgiver to whom is attributed the rigorous Spartan constitution. He is reputed to have lived in the ninth century B.C. It is, however, generally accepted now that the Spartan code was the result of laws and customs which had accumulated during centuries, and that Lycurgus was a mythical personage. It is clear that the constitution was not attributed to him until

the end of the fifth century. Nor does the Spartan poet, Tyrtaeus, make mention of him. It seems probable that Lycurgus was a local hero or deity worshipped as the protector against wolves (*Lyko-norgos*, wolf-repeller), and that the code was attributed to him on the analogy of the lawgivers of later times.

See GREECE, ANCIENT.

BURY, J. B. *History of Greece.* (London, 1909.)

LYON, MARY (1797-1849).—Founder of Mount Holyoke College and a pioneer in the cause of the higher education of women in the United States. Born at Buckland, Mass., she was largely self-educated, as there were few opportunities in her girlhood for the secondary and higher education of women. This lack, together with a keen sense of the need, influenced her life and started her upon a career of educational reform that has given her rank among the greatest women America has produced. She attended the district schools in rural Massachusetts, and by the age of seventeen she was teaching in a common school near Shelburne Falls at a wage of seventy-five cents a week "with board." At the age of twenty she entered the Sanderson Academy at Ashfield, and during the next four years she alternately taught in the common schools and continued her studies at the Sanderson and Amherst academies. In 1821 she entered the higher school for girls conducted by Joseph Emerson (*q.v.*) at Byfield, and the next year she was an assistant teacher in Sanderson Academy. During 1824 and 1825 she taught part of each year in Adams Academy at Derry, N.H., and pursued courses of study for the remainder of the time at Amherst College and the Rensselaer Institute.

From 1826 to 1828 she continued her teaching during the winter at Sanderson Academy and during the summer at Adams Academy, which at this time was under the direction of Mrs. Zilpah Grant Banister (*q.v.*), one of Miss Lyon's teachers in Joseph Emerson's school at Byfield. In 1828 Mrs. Banister organized a seminary at Ipswich, Mass., and during the next two years Miss Lyon taught in the Ipswich Seminary during the summer and took charge of a "select school" at Buckland, Mass., during the winter. She became vice-principal of the Ipswich Seminary in 1830, and during the next four years gave all her time to this institution.

The "select" winter school at Buckland was in a sense the germ of Mount Holyoke. Her school was the resort of many girls who had been, or who expected to become, teachers. Expenses were made as low as possible. Tuition was \$3 a quarter, and board was obtained at rates ranging from \$1 to \$1.25 a week. The philanthropic side of the work appealed strongly to Miss Lyon; and when in

1834 the Ipswich Seminary failed in its efforts to secure an endowment, she decided to enlist the interest of public-spirited people in the endowment of a seminary for the higher education of women. She secured the coöperation of a committee of prominent men, and a call was issued asking for one thousand dollars to finance the raising of the funds for the organization and endowment of the seminary. Miss Lyon undertook to secure this fund from women. Within two months the thousand dollars had been secured. Her former students, many of whom were now teachers, contributed a fourth of the sum, and the women in and about Ipswich the rest. Mount Holyoke was chartered in 1836 and opened the next year. (See MOUNT HOLYOKE COLLEGE.)

During the twelve years (1837-1849) that Miss Lyon was president of the seminary, her work was distinctly that of a pioneer. Her institution was ridiculed and caricatured by the secular press of the country as "a rib-factory," "Protestant nunnery," etc. But she had faith in her mission, and her appeal to "the common sense, the intelligence, and the spirit of fair play," ultimately triumphed. As one of her biographers writes, "Mary Lyon viewed Mount Holyoke as a plant for development, not of intellectual gymnasts, but of enlightened, useful women." Coöperative housework was made a feature of the seminary, and the life of the institution was made thoroughly democratic. Sixty dollars a year covered board and tuition, exclusive of charges for fuel and light. She died at South Hadley, Mass., on March 5, 1849, and her remains were buried on the grounds of the institution which she had founded. Beyond a pamphlet on *Female Education* (1839), and the circulars stating the purpose and character of Mount Holyoke Seminary, Miss Lyon left no educational publications. W. S. M.

LYONS, UNIVERSITY OF.—One of the most recently established universities in France. Although departments and faculties arose during the nineteenth century, they were not consolidated into a university until 1896. The claim that a *studium generale* existed at Lyons in the thirteenth century is denied by Rashdall (*Universities of Europe in the Middle Ages*), although there were undoubtedly very important schools there. Faculties of science and letters were established in 1808, but were again closed in 1816. The different faculties owed their origin in large measure to the public support and

interest of public bodies. In 1834 the faculty of science was established, and in 1838 the faculty of letters. A chair in law was founded by the municipal council and the chamber of commerce; in 1867 the *École libre de Droit* was established, and became a faculty in 1875. Medical courses were given, in connection with the hospitals of the town in 1820, and in 1834 the *École libre de Médecine* was founded, and in 1841 this was followed by the *École préparatoire de Médecine et de Pharmacie*. The faculty was organized in 1877. The University of Lyons has always adapted itself to the needs and demands of a commercial and industrial city, which on its side has always been ready with its financial support. There are now four faculties: law, science, letters, medicine and pharmacy; and two schools: *École de Chimie industrielle* and *École de Tannerie*. The enrollment in 1910 was 2922 (law, 853; medicine, 953; pharmacy, 148; science, 511; letters, 436). For the organization see FRANCE, EDUCATION IN.

MACVICAR, MALCOLM (1829-1904).—Normal school principal; educated at Knox College and the University of Rochester, he graduated from the latter institution in 1859. He was principal of the Brockport Collegiate Institute, which afterwards became the Brockport Normal School; principal of the New York State Normal School at Potsdam, and principal of the Michigan State Normal School at Ypsilanti. In 1888 he became the first chancellor of MacMaster University. He was the inventor of the MacVicar tellurian globe and the author of a popular series of textbooks on arithmetic. W. S. M.

McCORMICK THEOLOGICAL SEMINARY, CHICAGO, ILL.—An institution for the training of candidates for the ministry under the Presbyterian Church in the U.S.A., founded originally in 1830 as a branch of Hanover College, removed to New Albany in 1840, and 1859 to Chicago. The present name was adopted in 1886. Students are admitted on completing a regular college course. The Seminary offers two three-year courses leading to a diploma or the B.D. degree.

McCOSH, JAMES (1811-1894).—Philosopher and educator, born in Ayrshire, and educated at Glasgow and Edinburgh universities. In 1834 he became a minister, and assisted in establishing the Free Church of Scotland. In 1850 he published *The Method of Divine Government, physical and moral*, which led to his appointment as professor of logic and metaphysics at Queen's University, Belfast. Here he remained until 1868, playing an important part in the social and philanthropic work of the town. In 1868 he was invited to become president of Princeton College (*q.v.*), an office which he held until 1888, when he still continued his connection with the college as professor of

philosophy. McCosh wrote numerous philosophical works, including: *Institutions of the Mind inductively investigated* (1860); *An Examination of Mill's Philosophy* (1866); *Scottish Philosophy, Bibliographical and Critical* (1874); *Psychology of the Cognitive Powers* (1886); *Psychology of the Motive Powers* (1889); *Realistic Philosophy defended* (1887). Dr. McCosh lived at Princeton until his death on Nov. 16, 1894.

McELLIGOTT, JAMES NAPOLEON (1812-1866). — Textbook author. He studied at New York University and was principal of the School of Mechanics and Tradesmen in New York; became president of the New York Teachers' Association in 1849 and was editor of the *Teachers' Advocate*. He published many textbooks on spelling, reading, grammar, elocution, and Latin. W. S. M.

MCGILL COLLEGE AND UNIVERSITY, MONTREAL, CANADA. — Founded by the will of the Hon. James McGill (*d.* 1813) and chartered in 1821. Work was begun in 1829 with faculties of arts and medicine and was carried on for some time under great difficulties. In 1852 through the efforts of some citizens of Montreal an amended charter was secured; a faculty of law was added in 1852, a faculty of applied science was organized in 1878, although engineering had been taught since 1856; the faculty of agriculture was established in 1907. The supreme authority of the university is vested in the Crown with the Governor-general of Canada as visitor. The governors of the university are the members of the royal institution for the advancement of learning and the president of the governors is *ex officio* Chancellor of the University. The chief academic and administrative officer is the Principal. With McGill are affiliated a number of other institutions, e. g. Macdonald College (*q. v.*), McGill University College of British Columbia, Vancouver, B. C., and Victoria, B. C., Mount Allison and Acadia universities, and several theological colleges. Students in the affiliated institutions may pursue their studies either wholly there or in part in the affiliated colleges and in part at McGill, and receive their degrees on passing the examinations of McGill. In 1899 the Royal Victoria College for Women was established, providing opportunities for residence and college life for women, who are admitted only to the arts courses at McGill. This institution offers courses in arts and pure science, given by professors and lecturers of the university. The students of this college are students of the university. All the usual

university degrees are conferred by McGill on properly matriculated students who have completed the requirements of their courses. The total enrollment of students in 1911-1912 in McGill University and the affiliated colleges in British Columbia was 2484.

MCGUFFEY, WILLIAM HOLMES (1800-1873) — Textbook author. He was graduated from Washington College, Pa., in 1826; was professor in Miami University (1826-1836); president of Cincinnati College (1836-1839); president of Ohio University (1839-1843), and professor in the University of Virginia (1843-1873). He was the author of the widely used "Eclectic" readers and other schoolbooks.

W. S. M.

McKEEN, JOSEPH (1757-1807). — First president of Bowdoin College. He was graduated from Dartmouth College in 1774; taught eight years in the schools of New Hampshire and three years in the academy at Andover, Mass. He was pastor of a church at Beverly, Mass., for seventeen years, and president of Bowdoin College from 1801 to 1807. He advocated the introduction of scientific studies into the college course. W. S. M.

See BOWDOIN COLLEGE.

McKEEN, JOSEPH (1791-1856). — School superintendent. For many years he was engaged in public and private school work in New York City. For ten years (1844-1854) he was superintendent of the schools of New York City and for two years was associated with S. S. Randall (*q. v.*) as assistant superintendent. He edited for some years the *Teachers' Advocate* and was one of the organizers of the New York Teachers' Association, and its president in 1846. W. S. M.

McKENDREE COLLÈGE, LEBANON, ILL. — A coeducational institution founded in 1828, and maintaining academic, collegiate, domestic science, agriculture, expression, and music departments. Students are admitted from accredited high schools or by examination. The degrees of A. B., B. S., and B. Mus. are conferred by the institution. The enrollment in 1910-1911 was 279 in all departments. There is a teaching staff of seventeen members.

McLEAN, JOHN (1800-1886). — College president. He was graduated from Princeton in 1816 and two years later from the Princeton Theological Seminary. He was a professor at Princeton (1822-1854) and president of the institution (1854-1868). He wrote *School System of New Jersey* (1829) and *History of the College of New Jersey* (1877). W. S. M.

McMASTER UNIVERSITY, TORONTO, ONT. — A coeducational institution organized in 1887 under the auspices of the Baptist

churches of Ontario and Quebec. The following courses leading to their respective degrees are offered: arts, science, and theology. Students are admitted on passing the matriculation examination. The enrollment in 1911-1912 was 300. The faculty consists of twenty-three members.

McMINNVILLE COLLEGE, McMINN-VILLE, ORE. — A coeducational institution under the auspices of the Baptist denomination, chartered in 1858. Preparatory, collegiate, music, and commercial departments are maintained. Students are admitted to the College from four-year high schools. Classical, philosophical, and scientific courses are offered, leading to the degrees of A.B., B.Ph., and B.S. In 1910-1911 the enrollment in the college proper was forty students. The faculty consists of fifteen members.

McMURTRIE, HENRY (1793-1865). — Author of science textbooks. He was graduated from the University of Pennsylvania in 1814, and for many years was a professor in the medical department of that institution. He wrote textbooks in physiology, botany, zoology, hygiene, astronomy, and physics. W. S. M.

McPHERSON COLLEGE, McPHERSON, KANS. — A coeducational institution maintained by the Church of the Brethren with academic, collegiate, bible, education, and fine arts departments. The entrance requirements are fifteen units. The A.B. and B.S. degrees are conferred. Pre-medical and pre-engineering courses are also offered. The enrollment in the collegiate department in 1909-1910 was forty-five. There is a teaching staff of twenty-seven members.

MACALESTER COLLEGE, ST. PAUL, MINN. — A coeducational institution, the outgrowth of Baldwin School, established in 1853; opened as a college under the Synod of the Presbyterian Church of Minnesota in 1885. A preparatory school and college of liberal arts, requiring fifteen units of high school work for entrance, are maintained. The degrees of A.B. and B.S. are granted on completion of appropriate courses. In 1911-1912 there were 190 students in the college proper, and the faculty numbered twenty members.

MACDONALD COLLEGE (McGILL UNIVERSITY), ST. ANNE DE BELLEVUE, QUE. — A constituent body of McGill University founded and endowed by Sir William C. Macdonald for the advancement of education and research with special reference to rural problems, and for the training of teachers for rural districts. The work is distributed between the school of agriculture, school for teachers, and school of household science. In the school of agriculture the degree of B.S.A. is conferred

on the completion of a four-year course. The faculty consists of fifty-five members, and the enrollment of students in 1911-1912 was 478.

MACDONALD MOVEMENT. — See CANADA, EDUCATION IN.

MACERATA ROYAL UNIVERSITY, ITALY. — See ITALY, EDUCATION IN.

MACKEY, JOHN (1765-1831). — Author of school arithmetics. He was educated as a physician and practiced medicine a few years. From 1817 to the time of his death he was engaged in teaching. He wrote the *American Teacher's Assistant and Self Instructor's Guide* (1826), a textbook in arithmetic that was widely used. W. S. M.

MACLURE, WILLIAM (1763-1840). — First American disciple of Pestalozzianism. He was born at Ayr, Scotland, and engaged in commercial pursuits. Having acquired a competence, he retired from business in 1803 and took up his residence in Philadelphia. Soon after he was sent to Paris by President Jefferson as a member of the commission to settle the claims of American citizens against the French government for spoiliations committed during the French revolution. While in Europe he began the collection of objects for a museum of natural history for the United States, and made an extensive study of educational systems in the old world. Having visited Pestalozzi at Yverdon and Fellenberg (*q.v.*) at Hofwyl, he induced Joseph Neef (*q.v.*), one of Pestalozzi's former associates, to come to America and establish schools after the pattern of the Swiss reformer.

The first accounts of Pestalozzi's labors published in the United States were from the pen of Mr. Maclure. After his return to America in 1806, he began at his own expense a geological survey of the United States. Returning to Europe again in 1819 to study the industrial and educational schemes of Robert Owen (*q.v.*) at New Lanark, Scotland, he organized in the next year an industrial and agricultural school at Alicante, Spain. The overthrow of the constitutional government in 1824 and the confiscation of his property compelled him to give up his scheme for industrial education in Spain. Returning to the United States, he joined Robert Owen (*q.v.*) and his Utopian colony at New Harmony, Ind. Maclure invested \$150,000 in the New Harmony experiment, and aimed to make it the center of Pestalozzianism in America. Joseph Neef was placed at the head of the schools of the colony, and manual training and elementary science were made important features of the school course. With the failure of the colony in 1826 Mr. Maclure continued to live at New Harmony, engaged in literary and scientific labors. He was the moving spirit in the organization of the Academy

of Natural Sciences at Philadelphia in 1812, and its president from 1817 to the time of his death; and he was the virtual founder and the first president of the American Geological Society (out of which grew the American Association for the Advancement of Science) in 1828. His *Opinions on Various Subjects* (New Harmony, 1831) contains twenty essays on education. W. S. M.

MADAGASCAR.—See FRENCH COLONIES, EDUCATION IN.

MADISON, JAMES (1749–1812).—College president and bishop; graduated at William and Mary College, 1768, studied law and was admitted to the bar. He held a professorship at William and Mary College from 1773 to 1777, and was president of the college from 1777 to 1812. He advocated elective studies in collegiate institutions, and shared many of the views of Thomas Jefferson (*q.v.*) on higher education. W. S. M.

MADISON, JAMES (1751–1833).—President of the United States; was educated at Princeton; tutored for a time in his father's family; was long a trustee of William and Mary College; succeeded Thomas Jefferson as rector of the University of Virginia, having previously been a member of the board of trustees. President Madison was active in the movement for the establishment of public school systems, and shared the views of Jefferson (*q.v.*). W. S. M.

MADRAS SYSTEM—See MONITORIAL SYSTEM; BELL, ANDREW; LANCASTER.

MADRAS, UNIVERSITY OF.—See INDIA, EDUCATION IN.

MADRID, UNIVERSITY OF, SPAIN.—See SPAIN, EDUCATION IN.

MAGER, KARL WILHELM (1810–1858).—A prominent German educator, was born in Gräfrath, near Solingen, in the Rhine province. From 1828 to 1830 he studied philology and philosophy at the university of Bonn and then went to Paris, where he devoted three years to a thorough study of French literature. Returning to Berlin, he made the acquaintance of Alexander von Humboldt and accompanied him on a scientific journey to Russia (1835). In Berlin he also came in contact with Diesterweg (*q.v.*), with whom he spent much time in discussing problems of education. In 1837

he was called as professor of German to the College at Geneva, but a nervous trouble and the desire for more leisure to do literary work induced him to give up his position (1839). He returned to Germany and started (1840) the *Padagogische Revue*, to which his own contributions, written in a brilliant style, soon brought a large following. In 1841 he was called as professor of French literature to Aarau in Switzerland, but he left this position in 1844, because he found again that it took too much time away from his literary activity. In 1848 he was offered the principalship of the Realgymnasium at Eisenach, and accepted the call. But this new attempt to enter into the regular school service was also destined to be of short duration.

Mager's claim to a permanent place in the history of German education rests chiefly on his book, *Die deutsche Bürgerschule* (Stuttgart, 1840), which forms an epoch in the history of realistic institutions in Germany. It formulates the idea of a school with a modern education, which should meet the demands of the broad educated middle class of the people. With a firm hand Mager traces the outlines of the whole organization of such a school, and one may say that the modern educational institutions of the realistic type, such as the "Oberrealschule," are practically a realization of his plans.

Another important work of Mager is his *Genetische Methode des schulmassigen Unterrichts in fremden Sprachen und Literaturen* (*Genetic method of school instruction in foreign languages and literatures*, Zurich, 1846), which had considerable influence on the teaching of languages, both foreign and the mother tongue. F. M.

MAGIC—The art of controlling events by means of secret or supernatural formulas or agencies. The history of magic is of interest to the student of education and of psychology because magic is an early stage of science and religion. When men were ignorant of the laws of nature, any one who could bring about unfamiliar occurrences was looked upon with wonder. Thus the early priests were undoubtedly familiar with some of the simple principles of optics and they were able to produce by means of concave reflecting surfaces illusions now so familiar through the use of projection lanterns of all kinds. This command of optics was so far beyond the knowledge of the ordinary people that it gave the priests extraordinary influence over the ignorant observers, who regarded the phenomena as supernatural. Indeed, it may be doubted whether the priests themselves were altogether free from supersti-

tious fear in the presence of the forces which they only partially understood and controlled. The usual belief of the spectator in these cases was that the phenomena were due to a spirit of some kind. Gradually, as science developed, natural forces came to be recognized as causes of the processes and the possibilities of magic disappeared.

Whatever may have been the attitude of the earlier masters of magic, there grew up in every tribe a band of professional magicians. These were more or less closely related to the priests. At first they were priests, but gradually religion and magic separated. The magician consciously extended his personal control over nature, and hid his operations from his fellows. In many respects, the magician under the various forms in which he appeared was the teacher of primitive peoples. Very frequently he used his special knowledge for baneful purposes. The magician came to be a person to be shunned and hated. He was indeed sought and employed in emergencies, but for the most part, he was an outcast. He cultivated, however, in a crude way, a knowledge of nature, and thus laid the foundations for our modern sciences. Alchemy and the practices of the medicine man are conspicuous examples of magic which have developed into sciences.

On the psychological side, belief in magic is a clear mark of general ignorance. Man when ignorant of the real forces back of phenomena imagines mysterious forces, and thus satisfies his need for explanation. As explanation grows more complete and systematic, belief in magic is reduced. C. H. J.

MAHAN, ADRIAN (1800-1889).—College president. He was graduated from Hamilton College in 1824, and three years later from the Andover Theological Seminary. He was ordained to the ministry of the Congregational church in 1829, and served as a pastor for six years. Becoming the first president of Oberlin College in 1835, he held this position for fifteen years. He was president of Cleveland University from 1850 to 1854, and professor and president of Adrian College from 1857 to 1871. He wrote several works on mental philosophy, ethics, theology, and numerous articles in educational and religious journals. W. S. M.

See OBERLIN COLLEGE.

MAHAN, DENNIS HART (1802-1871).—Author of mathematical and scientific books. He was graduated from the United States Military Academy in 1824, and later studied at the Military School of Engineers and Artillery at Metz, France. He was professor of engineering and mathematics at the Military Academy at West Point from 1825 to 1871. His published works include treatises on geometry, engineering, and military science. W. S. M.

MAHĀVĪRĀRCĀYA.—One of the four great mathematical teachers of India. He probably lived in the court of one of the old Rāshtrakūta monarchs who ruled over what is now the kingdom of Mysore, and whose name is given as Amoghavarsha Nripātunga. This king reigned in the first half of the ninth century, so that the date of Mahāvīrārcāya's treatise is about 850 A.D. The work is entitled *Ganita-Sara-Sangraha*, and consists of nine chapters, chiefly on algebra, but containing some arithmetic, a little mensuration, and the rudiments of a crude trigonometry. D. E. S.

MAIDWELL, LEWIS.—An educational projector of academies and schools from 1700 to 1705. He was educated at Westminster School under Busby, and at St. John's College, Cambridge, graduating B.A. in 1671. He was a private tutor for five years. In 1700 Maidwell presented a scheme to the House of Commons for an academy for forty scholars, sons of gentlemen from thirteen to seventeen, to have a free education in languages, arts, and physical exercises. He offered his house in Westminster for the purpose. The subjects were to be Latin, Greek, French, Arithmetic, and

the use of the globes. He offered £300 a year for four fellowships to be held at the universities besides schemes for scholarships tenable at the University or on board his Majesty's ships of war, to be instructed in navigation. Maidwell did not succeed in obtaining support for this scheme which was remodelled so as to suggest a school instead of an academy, but without success. In 1705 he wrote *An Essay upon the Necessity and Excellency of Education, with an Account of Erecting the Royal Mathematical School*, in which he urges the establishment of a system of naval education and draws up a scheme to promote the art of navigation.

In 1707 Maidwell published his *Nova Grammatices Experimenta, or Some New Essays of a Natural and Artificial Grammar, which first demonstrates the Natural Rudiments of All Languages; and then by an Artificial Method, Facilitates the Perfect Knowledge of the English and Latin Tongues, without the Tædious Perplexitys of Common Grammar*. This is introduced with a poem by the poet laureate, Nahum Tate. It is a glorification (on the pretext of writing a Grammar) of Queen Anne and the Lord Godolphin, Lord High Treasurer, for whose grandson the curious book is written.

MAIMONIDES, MOSES BEN (1135-1204).

— The most eminent Jewish rabbi and philosopher of the Middle Ages, born in Cordova, Spain, and died in Cairo, Egypt. His unusual training in medicine, philosophy, and theology was possible owing to the Arabian revival of learning in southwestern Europe. The Mohammedan persecution of Jews finally drove out his family, which took flight to Egypt. Here Maimonides became influential, and eventually physician to the Sultan. He was an active author, writing in both Hebrew and Arabic. His greatest rabbinical book is the *Mishneh Torah* or *Yad ha-Hazakah*, containing a complete presentation of Talmudic Judaism. It has been the center of much controversy, and has lived through many editions, parts of it having been translated into Latin and English. His most important philosophical work is the *Guide to the Perplexed* (*Moreh Nebukim*), written originally in Arabic. In this book he made the effort to expound the principles of Judaism and those of Greek philosophy, chiefly the Aristotelian, so as to justify the former by the latter.

MAINE DE BIRAN (1766-1824). — Regarded by Victor Cousin as the greatest French metaphysician since Malebranche. Early in life he abandoned politics and the army for philosophy and won a prize from the Institute by his *Essai sur l'habitude*. He was a determined opponent of eighteenth century philosophy. He passed through three stages of belief; first belonging to the sensational school of Condillac, he later developed a system of his own, based upon internal reflection as the only legitimate method in philosophy. Finally he abandoned the standpoint of psychological experience for that of mystical intuition, in which the life of sensation and volition is absorbed in a life of love and communion with God. His literary style is heavy and his writings have been slow in securing the attention which they merit.

MAINE, STATE OF. — A part of Massachusetts up to 1820, when it was admitted to the Union as the twenty-third state. It is in the North Atlantic Division, and the most northeasterly of the states. It has a land area of 29,895 square miles, being almost as large as the other five New England states combined. For administrative purposes, the state is divided into sixteen counties, and these in turn into towns. The county is of practically no educational importance, the state dealing directly with the towns in educational matters. In 1910 Maine had a population of 742,371, and a density of population of 24.8 per square mile.

Educational History — The first record of a school in what is now the state of Maine was in the town of York in 1701, when Nathaniel Freeman was employed as a teacher. The town of Wells opened the second school in 1716. In 1725 the first public schoolhouse in the territory was built at York. Other early schools were opened at Portland in 1728; Buxton in 1761; New Gloucester in 1764; Machias in 1774; Canaan in 1778; Norridgewock in 1779; Union in 1785; and Castine in 1796. The first grammar school was opened in Portland in 1738. The Massachusetts laws of 1642 and 1647 (see MASSACHUSETTS) had applied to the territory of Maine as well, but had been difficult of enforcement there. Situated on the frontier, with constant trouble with the Indians, schools and education made but slow progress, and many

towns were "presented" for failure to comply with the law. By 1800 there were 161 organized towns, with grammar schools in seven.

On the admission of Maine into the Union as a separate state in 1820, the constitution then adopted required the towns to make suitable provision for the support of schools, and safeguarded the interests of Bowdoin College. This constitution is still in force. The district system, established by the Massachusetts law of 1789, was fixed, and remained for a little more than a century before it was abolished.

The new state school law of 1821 organized the system. It provided that every town and plantation must raise forty cents per inhabitant for schools; directed that competent masters should be employed, but permitted one third of the funds to be spent for a schoolmistress; directed every town to choose a superintending school committee of from three to seven to examine teachers, visit schools, dismiss incompetent teachers, determine the studies, and select the textbooks; provided for an agent in each school district to hire teachers and to provide fuel; declared each school district a body corporate, with power to locate school buildings and levy taxes; and for the division of the town school money among the districts on the basis of the number of children in the district, four to twenty-one years of age. In 1822 the town of Portland was permitted to organize under a special law, which permitted it to abolish the district organization and established a graded school. Bath in 1828 and Bangor in 1832 received similar permission. In this same legislature that granted town organization to Portland, the districts made an unsuccessful attempt to secure the power to appoint their own district agents, and thus make them practically independent of the towns.

A new law in 1825 made the selection of a superintending school committee mandatory, under fine for failure; gave the committee power to expel unruly scholars; required them to visit schools twice each year; ordered a school census to be taken each year, and school statistics to be reported once in three years; and allowed an expenditure of 10 per cent of the school money for fuel and repairs. In 1827 union town schools were authorized, and the beginnings of a system of grading made by allowing committees to determine what scholars should attend the master's and what the mistress' school. In 1834 the laws were revised and reenacted as one school code. The maximum number constituting a school committee was cut from seven to five, the committees were required to report to an annual school meeting, and permission was given to any town to abolish districts and organize itself under the town system.

Up to this time the development had been town and district development only. In 1843 and again in 1845 unsuccessful efforts were

made to unify the system, but it was not until 1893 that this was accomplished by the abolition of the district system. In 1846 a State Board of Education was created, consisting of one representative from each county, elected by the town school committees. This Board was to elect a secretary, whose duties were much the same as those of the Secretary of the Massachusetts State Board. The next year the first reasonably accurate statistics were collected. The year following, teachers' institutes were established in every county; school committees reduced from five to three, one to be elected each year; union district graded schools permitted; by-laws against truancy authorized; requirements for teachers' certificates increased; and the powers and duties of town and school committees enlarged. In 1852 this State Board and the office of Secretary were abolished, chiefly because the Board was not politically useful. County school commissioners, to be appointed by the Governor for one-year terms, were created instead, each to give fifty days of service annually, and to make an annual report to the legislature. This proving unsatisfactory, the legislature of 1854 abolished the county commissions and created the office of State Superintendent of Public Instruction, the Governor and Council to appoint, for three-year terms. This method of state supervision has continued to the present time. County supervision was again established in 1869 by the creation of county supervisors of schools, but they were abolished in 1872 and have not since been re-created. To the new Superintendent was assigned about the same duties as given formerly to the Secretary of the State Board. The new Superintendent was required to hold a county teachers' convention in each county each year, and \$2000 was appropriated as aid to this end. In 1858 a teachers' institute in each county and a state teachers' convention were ordered. In 1859 the first State Teachers' Association to form a permanent organization met at Waterville.

In 1828 the beginnings of a school fund were made. Twenty townships were set aside to constitute a school fund; in 1834 these were sold for \$110,000; and in 1848 the interest on this sum, at 6 per cent, was distributed to the towns. In 1856 twenty-four and one half townships were set aside for the same purpose; in 1864 the timber on ten additional townships of land; and in 1903 the money arising from the sale of timber and grass, or from trespasses on reserved lands, were added to the school fund. A bank tax of 1 per cent for educational purposes was levied in 1833, to be apportioned to the towns on census. In 1865, because of the decrease in the revenue from the bank tax, due to the establishment of national banks, the town tax was raised from forty cents to seventy-five cents, and, in 1868, to a dollar per inhabitant. At the same time, a state tax of one mill

was ordered for the benefit of schools, the income to be distributed to the towns on census. This was increased to one and one half mills, and in 1909 an additional state tax of one and one half mills, one third to be divided on census and two thirds on valuation, was ordered and an equalization fund of \$20,000 was set aside. In 1872 the town tax was reduced from a dollar to eighty cents, and in 1909 to fifty-five cents.

In 1860 state aid was given to eighteen academies for the training of teachers, but was withdrawn in 1862 as unsatisfactory. Teachers' institutes were also abolished at the same time, and were not revived until 1869. In 1868 the University of Maine was opened at Orono. In 1863 the first two state normal schools were established, the one at Farmington being opened in 1864, and at Castine in 1867. A third was opened at Gorham in 1879, a fourth at Presque Isle in 1905, and a fifth was authorized in 1909, and opened in 1911 at Machias. The Madawaska Training School at Port Kent, in the extreme northern part of the state, was established in 1887. State summer schools for teachers were established in 1895, and in 1901 \$2500 aid was given for the maintenance of four such schools. In 1873 a new high school law was enacted, whereby state aid up to a maximum of \$500 was granted to free high schools. Seventy-one academies and higher institutions had been chartered up to this time, but the new law caused many of these institutions to transfer themselves to public control. In 1879 the law was suspended for one year; in 1880 the state aid was reduced to \$250 and the teaching of ancient languages at state expense forbidden; and in 1909 a graded system of state aid for high schools, varying from \$450 to \$850, with state inspection, was substituted for the 1880 law. State aid to academies, up to \$250, was also granted for instruction in manual training, domestic science, and agriculture.

In 1875 a compulsory education law, which required three months' attendance of all children, 9-15 years of age, was enacted. The requirements have been increased since then to include all children from 6-17. In 1909 a combined compulsory education and child labor law was enacted, similar to such laws in the other New England States. In 1892 the constitution of the state was amended so as to grant the right of suffrage only to those who are able to read the constitution of the state in the English language and to write their names. In 1895 a system of state examinations for teachers' certificates was established. In 1897 a state school for the deaf and a state school for the feeble-minded were established. In 1909 school physicians were provided for; the State Superintendent was instructed to furnish plans and specifications for all school buildings of not over four rooms; and other measures of importance, mentioned above, were enacted. In 1911 the State Superintendent was instructed to investi-

gate the needs for industrial education, special courses were provided for in the state normal schools, and state aid was provided for high schools and industrial schools offering such instruction — \$500 to high schools and \$2000 to industrial schools.

Present School System. — At the head of the present school system is a State Superintendent of Public Instruction, appointed by the Governor with the concurrence of the Council, for three-year terms. He receives a salary of \$2500 and traveling expenses. There is no State Board of Education or analogous body. The Superintendent has general supervision over the schools of the state; conducts county and summer training schools; prescribes the studies to be taught in the common schools; furnishes blanks, forms, and record books to the town school authorities, holds examinations for state teachers' certificates, prescribes the tests, issues the certificates, and keeps a record of those passing for the information of school authorities; grants certificates of qualification to town superintendents; assumes control of schools founded as the result of public bequests; approves unions of towns to employ a superintendent of schools, appoints school agents for unorganized territory, prepares directions for testing the sight and hearing of the school children of the state; issues such circulars of information as he deems desirable; examines all high schools, in person or by deputy, for grants of state aid; is an *ex officio* member of the State Board of Normal School Trustees, which controls the five normal schools of the state and the Madawaska Training School; determines the conditions for admission to these schools; receives the census and school reports from all the towns, and makes an annual report to the Governor and Council.

There are no county school authorities in Maine, the next unit below the state being the town. The schools of each town are under the control of a town school committee of three, one chosen by ballot each year at the annual meeting for a three-year term. Cities operating under special charters select boards of education, as provided for by the charter. It is the duty of the school committee to approve the course and subjects of instruction, with liberty to add to the studies prescribed by the State Superintendent; to select textbooks for five-year periods, furnish them to the schools, and contract with publishers as to the sale price for those sold to parents who wish to provide their own books; to dismiss teachers and to expel pupils for cause; to exclude unvaccinated children; to classify scholars; to determine the rates of tuition for those living outside the town; and to make rules and regulations for the government of the schools. All towns must provide free textbooks; must raise money for buildings and repairs; must provide a term of twenty-six weeks in all schools; may levy a tax for evening elementary schools; may

provide for instruction in manual training and industrial and mechanical drawing. Two or more towns may unite to maintain a union elementary school, the towns paying in proportion to census. On recommendation of the school committee, towns, in annual meeting, may abolish or change schools. Schools of less than eight in average attendance may be suspended, and transportation and board may be paid for the pupils to attend elsewhere. Plantations have the same liability as towns for schools. The State Superintendent must appoint an agent for all unorganized territory, and, if there are two or more children in any unorganized territory, he shall arrange for their schooling there, or elsewhere.

Each school committee must annually elect a superintendent of schools, who acts for the committee in many matters which used to be attended to by the committees. He acts as secretary to the committee; employs all teachers, subject to the approval of the committee; oversees the annual school census; examines the schools and pupils at least twice each term; and makes a written report to the annual town meeting. Two or more towns, employing a total of twenty to fifty teachers, may unite to employ a superintendent, apportioning the expense in proportion to the service rendered the town. For such unions, the state will grant aid for the salary of the superintendent of twice the amount raised by the towns, with a maximum of \$800. To towns and cities employing more than fifty teachers, the state will grant as aid two thirds of the amount raised, up to \$800. All superintendents receiving such state aid must hold a state certificate for supervision.

School Support. — The Maine school fund, derived from the sources enumerated above, under *Educational History*, now amounts to about half a million dollars, and produces about 1 per cent of the total revenue for schools. A state tax of one mill on all property was levied in 1868, and in 1907 this was raised to one and one half mills. In 1909 an additional state tax of one and one half mills, and an equalization fund of \$20,000 each year, were added, while at the same time the required local town tax was reduced from eighty cents to fifty-five cents per inhabitant. This will shift somewhat the burden of support from the towns to the state, and will tend to provide a greater equalization of educational burdens and opportunities. In 1911 the equalization fund was increased to \$27,500. Of the state tax two thirds is distributed on the basis of the school census, five to twenty-one, and the remaining third on the basis of the valuation of the towns. To all towns that raise a tax of over four mills for schools, one tenth additional shall be added from the equalization fund. The remainder of all school money comes from local (town) taxation. State aid is also given to schools and towns providing industrial training.

The total amount expended for schools during the last year for which reports are available was \$1,875,605; or a per capita of the total population expenditure of \$2.52.

Educational Conditions. — Of the total population in 1910, 48.6 per cent lived in rural districts and 26.3 per cent in cities of over 8000 inhabitants. The illiteracy in 1900 was 5.1 per cent, while 99.7 per cent of the total population were of the white race, and 86.6 per cent were native born. In northern Maine, there are large areas which are very sparsely inhabited, and 59 unorganized townships, containing an average of less than fourteen children of school age in each, were reported in 1910. For such children, the law requires that the State Superintendent shall provide a teacher, transport them daily to another school, or bring them to a school and board them while attending. \$1708 was expended for the board and transportation of such pupils in 1909-1910. Much has also been done in recent years in the consolidation of schools and the transportation of pupils, nearly 800 schools having been closed since 1900, and, in 1909-1910, 6051 pupils were transported and \$114,795 was expended for transportation.

More than one half of the schools are ungraded, and one fifth of the schools were reported as not using a course of study. A little more than one school in six has a school library.

The state has good compulsory education and child labor laws, and the towns employed 862 truant officers to enforce the law. All children, seven to fourteen, must attend some school during the time the public schools are in session. The truant officer is to visit business establishments, look after truancy, and bring to trial those who violate the law. The state also provides medical inspection for the schools, and examines all pupils for common defects.

Teachers and Training. — The state employed 6905 teachers in 1909-1910. Of this number 17 per cent were beginners; 24 per cent were graduates of normal schools; and 22 per cent held state certificates. The remaining 78 per cent were certificated by the local town authorities. The average annual salaries for men teachers are about \$300 and for women teachers about \$230. These figures, and the conditions of state aid to teachers' institutes and high schools, indicate a low standard of pay for educational service.

For the training of teachers in service, the state provides that thirty or more teachers in any county may form an association and hold an annual convention, under the supervision of the State Superintendent. Teachers may receive pay for two days' attendance. The state agrees to pay all expenses, but the sum of \$1000 only is appropriated to pay for all the institutes in the state each year. Four summer normals for teachers are also provided by the state, for which the sum of \$2500 is appro-

priated. Five hundred and sixty-eight teachers attended these summer schools in 1910. Attendance at all institutes and associations is optional.

For the training of new teachers, the state maintains five regular normal schools, located at Farmington, Castine, Gorham, Presque Isle, and Machias. The state also maintains the Madawaska Training School at Fort Kent, in the extreme northern part of the state, for eight months each year, for the training of teachers to teach in the Madawaska District of northern Maine. These schools are under the control of a board of nine trustees, consisting of the Governor, State Superintendent of Public Instruction, and seven others appointed by the Governor.

Secondary Education. — By the new law of 1909 all free high schools are to be classified into three divisions as follows: *A.* At least one 4 year course, a 36 week term, proper laboratory equipment, at least two teachers employed, and a total taxation cost for maintenance of at least \$850. *B.* At least one 2 year course, a 36 week term, proper laboratory equipment, and a total taxation cost for maintenance of at least \$500. Tuition to be paid for pupils elsewhere for remaining two years. *C.* At least one 4 year course, for 30 weeks, and a total taxation cost for maintenance of at least \$450. All schools are to be inspected for approval by the State Superintendent, with state aid of two thirds of the amount paid for instruction, up to a maximum state grant of \$500.

Academies giving instruction equivalent to high schools, of which there were forty-eight on the accepted list, may receive aid, as follows:—

For an approved English course, \$500.

For an approved College Preparatory course, in addition, \$750.

For an approved Teachers' Training course, in addition, \$1,000.

If academy's income is over \$1,000, the maximum grant is \$500.

If academy's income is over \$1,600, no aid can be granted.

There were 552 teachers in the free high schools of the state in 1910, and 219 in the accredited academies.

Higher and Other Education. — The University of Maine, at Orono (*q.v.*), opened in 1863, offering instruction to both sexes in agriculture, English, education, and general scientific and literary studies, stands at the head of the school system of the state. This institution, however, has in the past received little support from the state. The instruction given is supplemented by that given in three other institutions, as follows:—

Bowdoin College, Brunswick, 1802, non-sectarian. Men.

Bates College, Lewiston, 1863, non-sectarian. Both sexes.

Colby College, Waterville, 1818, Baptist. Both sexes.

The state also maintains the Maine Industrial (Reformatory) School for Girls, at Hallowell; the Maine State (Reformatory) School for Boys, at Portland; the Maine State School for the Deaf, at Portland; the Maine State School for the Feeble-Minded (established in 1907); and the Bath Military and Naval Orphan Asylum. The state also pays for the education of its blind at the Perkins Institute for the Blind, in Boston. E. P. C.

HALL, E. W. *History of Higher Education in Maine, Cur. Inf. U. S. Bur. Educ.*, No. 3, 1903. (Washington, 1903)

Laws of Maine relating to Public Schools, 1911 ed.

MAINE, UNIVERSITY OF, ORONO, ME. — A coeducational institution, founded as a result of the land grants of 1862 as a State College of Agriculture and the Mechanic Arts. The name was changed in 1897 to the University of Maine, as an integral part of the public educational system of the state. The university is maintained from the income of the several grants from Congress, the annual state appropriations, and student fees. The university is divided into the following colleges: arts and sciences, agriculture, technology, law; and an agricultural experiment station is maintained. The entrance requirements are fourteen units, except in the college of law. The university grants in the various departments of the college the degrees of B. A., B. S., LL. B., Ph. C. (Pharmaceutical Chemist), and master's degrees. Short courses are offered for farmers, teachers, and pharmacists. The enrollment in 1911-1912 was 806, distributed as follows: arts and science, 196; agriculture, 294; technology, 298; law, 108. The faculty numbers 106 members.

MAINTENON (MME. DE) FRANÇOISE D'AUBIGNÉ, MARQUISE DE MAINTENON (1635-1719). — The second wife of Louis XIV (1685). In the interval between the death of her first husband, Scarron, the poet, and her marriage to the king, she was installed as governess over the children of Mme. de Montespan and Louis XIV. This made it possible for her to buy the estate of Maintenon, later raised to a marquise. She exercised a quiet, wholesome influence at a time when the French court life was anything but blameless. Inspired by an intense interest in children, she started a small establishment for poor girls, which subsequently grew into the school of Saint-Cyr (1686), destined for the education of daughters of impecunious noblemen, and one of the earliest attempts in France at the serious public education of girls. Racine's *Athalie* and *Esther* were written expressly for dramatic presentation by the girls of this institution. F. E. F.

MAINZ, UNIVERSITY OF, GERMANY.

— A university was founded at Mainz by a Bull of Pope Sixtus IV granted in 1476. A charter was given in 1477 by the Archbishop of Mainz, who had petitioned for the establishment of the university. A century later the university came under the control of the Jesuits, who remained there until the suppression of the Order in 1773. A reorganization took place in the same year; the university was endowed anew; and the teaching staff was increased and strengthened. The French aggression, however, put an end to these efforts, and the university was closed in 1798.

MAITTAIRE, MICHEL (1667-1747). — Educationist and author; was born in 1667 in France, of Huguenot parents. The father was naturalized in England in 1682, and the son was sent to Westminster School, under Dr. Busby. With Dr. South as patron, Maittaire was preferred to a studentship of Christ Church, Oxford. From 1695 to 1699, Maittaire was second master in his old school of Westminster. In 1699 he resigned his mastership and devoted himself entirely to literature, particularly undertaking bibliographical and philological researches and the editing of the classics with notes and indexes (among others the Greek text of Anacreon, with translations into Latin verse and prose). His native country was proud of his fame, and gave him a passport to prosecute his researches in Paris. He corresponded with all the savants of Europe, by whom he was respected for his erudition, character, and excellent temper and love of truth. In 1706 he published a book on the Greek dialects *in usum Scholæ Westmonasteriensis*, dedicated to the school. In 1709 appeared his *Stephanorum Historia*, an account of the lives and books issued by the old French Huguenot printers, the Estiennes. In 1712 was issued Maittaire's well-known *English Grammar*, written to afford a good training in English before beginning Latin studies. In 1717 he wrote *Historia typographorum aliquot Parisiensium*, and in 1719 began his valuable *Annales Typographici ab Artis inventæ origine*, the final volume of which was completed in 1741. In 1719 Maittaire published by subscription *Miscellanea Græcorum aliquot Scriptorum carmina*. In 1732 he had edited and annotated a new edition of Selden's *Marmora Arundelliana*. In 1742 he published a collection of his own Latin

poems under the title *Senilia*. He published an enormous number of editions of the classics, so that it is said his name began to be used in titles of books which he had not edited.

MAKIN, MRS. BATHSUA. — The author of the earliest treatise on women's education in England, written by a woman teacher. She was appointed, about 1641, teacher of Charles I's daughter, Elizabeth, then a child of six years of age. It is said that by eight years of age the child read and wrote in French, Italian, Latin, Greek, and Hebrew. Mrs. Makin appears to have conducted a school at Putney, and afterwards, in 1673, she established a girls' school at Tottenham High Cross, within four miles of London.

In the prospectus of this school, which is appended as a postscript to the *Essay* — probably the earliest extant prospectus of a girls' high school in England, she proposes to teach "all things ordinarily taught in other schools," viz. work of all sorts, needlework, dancing, music, singing, writing, keeping accounts, to take up half the school time; the other half time is for teaching the Latin and French tongues. Those that please may also learn Greek and Hebrew, Italian and Spanish. "In all which," adds the authoress, "this Gentlewoman (the announcement is throughout in the third person) hath a competent knowledge." Girls ("gentlewomen") may be instructed at eight or nine at this school in a year or two (according to their abilities) in Latin and French. The Rules for the foreign languages will be accommodated to the grammar of the English language. "Repositories for Visibles," i.e. collections of specimens, shall be prepared. She had learned (from Comenius probably) that from "beholding the things" it will be more easy for gentlewomen to learn the names, natures, value and use of herbs, shrubs, trees, mineral juices, metals, and stones. Those that please may learn limning (drawing), preserving, pastry, and cookery. Those that will allow longer time may obtain some general knowledge in astronomy, geography, but especially in arithmetic and history. Girls are to take experimental philosophy, "and as to the other things named, more or fewer as they incline."

The prospectus is added to Mrs. Makin's single publication: *An Essay to Revive the Ancient Education of Gentlewomen*, 1673. This is a noteworthy tractate, showing that in former ages women have been educated in the arts and the sciences, and citing historical instances. Her tractate, especially in the logical treatment, is founded on a logical dissertation of Anna Maria Schurmann, of Utrecht, translated into English in 1659 by C. B.,

entitled: "The learned Maid, or whether a Maid may be a Scholar," a decidedly clever brochure. (See Una Birch, *Anna Van Schurmann*. London, 1909.) F. W.

MALCOLM, HOWARD (1799–1879).—

College president. He studied at Dickinson College and the Princeton Theological Seminary. He was president of Georgetown College, Kentucky (1849–1851), and Bucknell University, at Lewisburg, Pa (1851–1857), and for some years was secretary of the American Sunday School Union. He was the author of a dictionary of the Bible and numerous religious works. W. S. M.

MALE TEACHERS.—See TEACHERS, SEX OF.

MALEBRANCHE, NICOLAS (1638–1715).

— One of the greatest French philosophers, who expected to enter the Church as his life work. Suffering from a weak constitution, and having a retiring disposition, he declined, after completing his studies at the Sorbonne, to become upon invitation a canon at Notre Dame in Paris. Instead he became a member of the Congregation of the Oratory of Jesus, an order that was opposed by the Society of Jesus. His talents lay dormant several years, while he was making ineffectual efforts with church history and Biblical criticism. Upon reading one of the works of Des Cartes (the *Traité de l'Homme*), which came to his hands by accident, he found his true calling. It is said that the Cartesian ideas so completely seized him that the reading had to be interrupted by reason of violent palpitation of the heart. In the course of a decade he wrote his chief work, the famous *De la Recherche de la Vérité* (1674). This and other important works, *Christian and Metaphysical Meditation* (1683) and *Discussions on Metaphysics and Religion* (1688), were devoted to the completion of the development of Cartesianism which Malebranche's thinking accomplished. The interaction between mind and bodies was an unsolved problem left by Des Cartes. Malebranche solved it by applying the principle that "we see all things in God." God is known directly and immediately, as he is also the place of spirits. Things are in Him in archetypal form, which we perceive as ideas. Malebranche struggled against pantheism, and held to the freedom of man. The acute psychological analyses, which led to the support of his doctrine, especially in his first book, were also contributions to

educational theory, quite as much as the rules (sixth book) which should be observed in the search of truth may be applied to the work of teaching. As a philosopher and an Oratorian, Malebranche aided greatly in extending the general educational benefits of the work of Des Cartes (*q v*). E. F. B.

MALIM, WILLIAM (1533–1594).— Headmaster of Eton College and of St. Paul's School, London; probably was a native of Canterbury. He went to Eton College and King's College, Cambridge, where he graduated B.A. 1553, and M.A. in 1556. On entering on his duties at Eton (1561), he drew up in Latin a *Consuetudinarium*, which stated the rules and observances kept in the college at the beginning of the reign of Queen Elizabeth; the document is still extant at Corpus Christi College, Cambridge. The *Consuetudinarium* contains in the first part the special and exceptional customs observed at different parts of the year, and in the second a record of the daily routine of school life. (See ETON.) The incident of the flogging of the scholars at Eton, on hearing of which Ascham (*q v*) was prompted to write the *Scholemaster*, took place in the rule of Malim, who continued the flogging tradition of the former head, Nicholas Udall (*q v*). Malim remained at Eton until 1571. In 1573 he became headmaster of St. Paul's school, where he remained till 1581, and he is stated to have lived, after retirement, till 1594. Besides the *Consuetudinarium*, he edited the *De Republica Anglorum Instauranda* (1579) of Sir Thomas Chaloner and wrote a number of commendatory Latin verses or letters to the literary work of friends. LYTE, SIR H. M. *History of Eton College*. 4th ed. (London, 1911.)

MALTA, EDUCATION IN.— Malta, with the adjacent island of Gozo, comprises an area of 117 square miles and a population of 215,879, chiefly Italian. The island was taken by the British in 1800 and formally ceded to Great Britain in 1804. The modern system of education may be said to date from 1835, when a royal commission was appointed to inquire into the existing provision for the education of the native population. Three elementary schools were in operation at the time, supported by the government; one at Valletta, the chief town, one at Senglea, and one at Gozo. About 720 children were in attendance, and the annual expenditure for the schools was £400 (\$2000).

Ten new schools, comprising two departments each, one for boys, the other for girls, were opened, and an appropriation of £850 per annum was made for their support. At the time the rector of the university was charged with the control of primary schools. In 1844 this relation ceased by the creation of the office of Director of Primary Education. Subsequently the office was extended to include all departments of education, and a special service of inspection was created for elementary schools. This service has been well maintained, and as regards number the provision of schools is quite adequate. According to the official report for 1910, there were thirty-eight elementary schools for boys, thirty-two for girls, and nine for infants (boys and girls). The enrollment was 19,360, or very nearly 9 per cent of the population; the teaching staff numbered 739, and the expenditure for the schools amounted to £27,532 (\$133,805), borne by the government.

The schools are regularly inspected and an annual examination made of all pupils. Parents and guardians are allowed to make choice of either English or Italian as the language of colloquial instruction for their children in the infant and the elementary schools up to Grade Three. The choice for 1910 gave preference to English in respect to 96.3 per cent of all pupils. Drawing, modeling, and woodcarving are included in the program of studies, and needlework in schools for girls. The catechism of the Roman Catholic Church is also taught in deference to the religious convictions of 90 per cent of the families represented in the schools. In addition to the regular day schools, one public Sunday school for secular instruction and thirty-three night schools were reported for 1910-1911. In the principal towns night drawing classes are supported, and many pupils from these classes enter as candidates for the South Kensington examinations.

There are two public secondary schools, one for girls at Valletta, having about 250 pupils, and the second for boys at Gozo, with an enrollment of sixty students. The former offers modern languages and the usual literary branches; the latter, a Latin scientific course. The Lyceum is a secondary school of the highest order, having a full classical course. Students are admitted by examination and prepare for the university faculties. The Lyceum enrolls generally between four and five hundred students (470 in 1909). There are also five private secondary schools with courses of instruction leading to the university, a school of marine engineering, with twenty-four students, and a school of electrical engineering with thirty-eight students.

The University of Malta was established in 1769 by Grand Master Pinto in the buildings previously occupied by a college founded by the Jesuits in 1602. The present organization of the university dates from a statute of 1898

which placed it under the direction of a rector assisted by a council in which the government and the university faculties are represented. There are four faculties, among which the students were distributed as follows in 1909: theology, 17; law, 38; medicine, 15; literature and science, 88; total, 158. The university is an important center for meteorological observations, the returns of which are daily interchanged with those of the other Mediterranean stations and constant interchange maintained, also, with the chief stations of Europe. The Argotti Botanical Gardens also form an important scientific adjunct of the university.

The government expenditure for secondary and university education in 1909-1910 was £10,236, which, with the appropriation for elementary schools and £1442 for the office expenses, gave a total of £39,210 (\$190,560).

MALVERN COLLEGE. — See GRAMMAR SCHOOL; COLLEGE; COLLEGE, ENGLISH; PUBLIC SCHOOLS.

MAN, ISLE OF, EDUCATION IN. — From early times there existed in the Isle of Man, as elsewhere, parochial church schools; but the island is chiefly remarkable for the earliest educational experiment in compulsory education. At the very time that education in England was falling into its worst period, the Manx clergy and the King of Man (Lord Derby) gave the island a statutory system of education. This act was first passed in the shape of articles at a convocation of the clergy at Bishop's Court on Feb. 3, 1703-1704; it was approved at a Tynwald Court the next day, and confirmed by Lord Derby; and on June 6, 1704, was publicly proclaimed upon the Tynwald Hill according to ancient form and custom. It was a compulsory act: "all persons shall be obliged to send their children as soon as they are capable of receiving instruction to some petty school, and to continue them there until the said children can read English distinctly." The parents who neglected the duty were subject to fine, if duly "presented" for neglect by the minister, churchwardens, or Chapter Quest; moreover, the fine was to be inflicted if the children were not sent regularly. The fees were sixpence quarterly, if only reading were taught, and ninepence, if writing were included. The fees could be recovered by regular process. But the education was to be free, if the parents or relations were duly certified as poor persons. Exception as to regular attendance was made,

if the children were needed at home in harvest time. It is interesting to note this provision was followed in the English Elementary Education Act of 1876 (Section 9). Children so allowed leave of absence had to receive special Sunday instruction every third Sunday at the parish church from the schoolmaster at least an hour before evening service. The act provided for efficient schoolmasters and for the quarterly inspection of the schools. It proved efficient, but it was found necessary by an act of 1813 to increase the fees to 2s. 11d a quarter for every child that learned English only, while 3s. 6d. was charged for each scholar taught to read and write. The lower scale was "altogether inadequate in the present day." Soon after this the National Society (*q.v.*) began to make grants to the schools, and nine school building grants were made by the English Treasury between 1835 and 1840. The Manx legislature in 1881 passed a further act to make better provision for schoolmasters and school management. By an act of 1872 an education board and school committees were formed, and the principles of the English act of 1870 were adopted. An act of 1878 made education compulsory under the new system, and further acts were passed in 1881 and 1884. The law was amended and consolidated by an act of 1893, which defined the term "elementary education." This act was amended in 1898, and by an act of 1899 the present Council of Education assumed control. The Manx authorities in many ways have offered an historical object lesson in education to modern educational areas.

MANCHESTER COLLEGE, NORTH MANCHESTER, IND.—A coeducational institution founded in 1889 under the control of the Church of the Brethren. Academic, Bible, collegiate, normal, music, and business departments are maintained. Students are admitted on completion of a high school course. The A.B. degree is conferred. The teaching staff consists of twenty members.

MANCHESTER, UNIVERSITY OF, MANCHESTER, ENGLAND.—One of the recently founded English universities. It was established in 1851 by will of John Owens as the Owens College for the purpose of "providing or aiding the means of instructing and improving young persons of the male sex (and being of an age not less than fourteen years) in such branches of learning and science as are now, and

may be hereafter, usually taught in the English universities." Another object of the foundation was to furnish an institution of learning free from denominational tests and subscriptions, to which Owens was opposed. At the time there was no place except the University College, London, which satisfied these requirements. Thus the college marked the beginning of a new era in higher education in England, and paved the way for some twelve other similar institutions established in populous commercial and industrial centers. Work was begun in Quay Street, in a house which was formerly the residence of Richard Cobden, in 1851 with A. J. Scott as the first principal, assisted by four professors and two teachers. The first scholarships (Victoria and Wellington) were established in 1852. In 1853 a chair of history was founded and filled by R. Copley Christie, who also taught political economy and jurisprudence. For several years it seemed that the college could not succeed. But in the sixties marked progress was made, and has been maintained ever since. In 1870 the age of entrance was raised to sixteen. In 1872 the Manchester Royal School of Medicine, founded in 1824, in which John Dalton taught chemistry, was incorporated with the college. The requirements had already outgrown the existing accommodations, so a new site was acquired, and new buildings were opened in 1873, and additions have been made continually (Whitworth Engineering Laboratory, 1887 and 1909; Manchester Museum, 1887; Christie Library, 1898, Whitworth Hall, 1902; chemistry laboratories, 1895 and 1905; physical laboratories, 1908; Students' Union and gymnasium, 1909; botanical laboratories, 1911). The chair of organic chemistry, the first of its kind in the country, was founded in 1874, and in the same year the chair in geology, filled by Professor W. Boyd Dawkins, was established. In 1874 a course of lectures was given to women, but they were not admitted to the regular classes. The governors were opposed to mixed classes, and in 1877 refused to sanction their admission. In that year the College of Women was opened in close proximity to the college and was taken over in 1883. Women are now admitted to all classes except engineering. In 1880 the Owens College became the first constituent part of the Victoria University, and was soon joined by University College, Liverpool, and Yorkshire College, Leeds. In 1889 Professor A. W. Ward was appointed principal in succession to Principal J. G. Greenwood (1857-1889), and in the same year the first parliamentary grant was received and scholarships were founded by local authorities. A Day Training Department for Men was opened in 1890, and was followed two years later by a similar department for women. Principal Ward was succeeded in 1897 by Mr., now Sir, Alfred Hopkinson, the present vice-chancellor.

In 1903 Owens College became by charter the Victoria University of Manchester, with power to grant degrees, diplomas, and other distinctions. Local interest was stimulated by this step, and many local authorities make annual grants to the university, while numerous private bequests have recently been made. The aim of the university is so far as possible to meet the requirements and needs of the community. The university was one of the first to grant a degree in commercial subjects. In addition to its reputation in the scientific branches (chemistry, physics, engineering, geology), the university has strong departments in history, English literature, and education, while the medical department, which has always enjoyed a high rank, has been considerably strengthened by the propinquity of the new Royal Infirmary. The university works in conjunction with other institutions in maintaining several departments: music with the Royal Manchester College of Music, technology with the Manchester Municipal School of Technology, and theology with several local theological colleges. Some of the courses at these institutions are recognized for degrees in the university. In the same way the medical department has obtained clinical facilities in many of the local hospitals. The university by its power of inspecting and examining schools plays an important part in promoting and supervising secondary education, and it also has representatives on numerous local education committees. Degrees are granted in the following faculties: arts, science, law, music, commerce, medicine, theology, and technology. The governing body consists of the chancellor (in 1912 Lord Morley), the vice-chancellor, the court, the council, the senate, and the boards of faculties. The university is maintained by income from endowments and invested funds, fees, and grants from the local and central authorities. There is a strong student activity, which centers round the Students' Union, housed in an excellent building opened in 1909, the Students' Representative Council, numerous clubs and societies, and the Athletic Union, for which a large athletic field was acquired in 1901. The enrollment in 1911-12 was 1557 day students. The teaching staff numbers 242 members.

MANCINUS, DOMINIC.—Writer of the *Liber de quattuor virtutibus et omnibus officiis ad bene beateque vivendum pertinentibus*. (Leipzig, 1505 (35 leaves), also 1512, 1516) He wrote approved little works in which his fame was far

spread. Tritheim in his *Catalogus Scriptorum Ecclesiasticorum* (1493) states that Mancinus, of whom he speaks very highly, was a contemporary. A translation of the work was made into English prose, entitled *The englysche of Mancynye upon the foure cardynal vertues*, published by Pynson (c. 1520). This anonymous rendering contains a preface in which the translator shows how the book may be used for double translation. About 1523 Mancinus's book was translated into English verse by Alexander Barclay under the title of *The Mirroure of good Maners* (also published by R. Pynson). In 1568 George Turbeville translated the same book into English verse, with the title a *plaine Path to perfect Virtue*. The object of the Latin verses of Mancinus is to inculcate in the most pleasant form the four cardinal virtues, which he names as Prudence, Justice, Magnanimity, and Temperance. The book was very popular and in use in English schools at any rate till the first half of the seventeenth century, when it was on the list of books of which the Stationers' Company retained the privilege of publishing. Barclay in his Prologue states that the book is to be used to teach "maidens of tender age" as well as boys. Mancinus also wrote in Latin verse another well-known book: *De Passione domini nostri Jesu Christi*, c. 1490. F. W.

MANDEVILLE, BERNARD (1670?-1733).—Author of the *Fable of the Bees*, or *Private Vices Public Benefits*, which first appeared in 1705 under the title of *The Grumbling Hive or Knaves turned Honest*, a doggerel poem giving an allegorical account of the prosperity of a hive in a reign of vice and its decline under the rule of virtue. The work as well as the later additions made to it (notes, an *Inquiry into the Origin of Moral Virtue*, *Essays on Charity and Charity Schools*, and a *Search into the Nature of Society*), because of the satirical and cynical tone caused considerable criticism. Here it is only necessary to refer to Mandeville's interesting arguments against charity schools, arguments which have been levied frequently against the spread of elementary schools. The precept and the example of good parents has much more influence than education. Clothing and educating children relieves the parents from responsibility and pauperizes them. Education does not diminish crime, which is fostered by circumstances rather than vice in nature. Those who establish charity schools are diminutive patriots and interfering meddlers. In any case education is bad for the poor, for it trains them to ease and idleness, and makes them discontented with their lot; "the knowledge of the working poor should be confined within the verge of their occupations." Education "incapacitates them (children of the poor) ever after for downright labor, which is their proper province, and in every civil society a portion they ought not to repine or grumble at, if exacted from them with discretion

and humanity." Sir James Fitzstephen Stephen remarks of this essay that it is "perhaps the first specimen of a way of writing about popular education which prevailed down to our own times."

MANHATTAN COLLEGE, NEW YORK CITY. — See CHRISTIAN BROTHERS, SCHOOLS OF.

MANIA. — A symptom in a number of diseases, — paresis (*q.v.*), dementia precox (*q.v.*), epilepsy (*q.v.*), hysteria (*q.v.*), and senile conditions, — including motor excitation, evidenced usually by speech, and mental excitement; or a disease condition, the excited form of manic-depressive insanity (see CIRCULAR INSANITY). The disease is manifested by motor unrest or excitement, by emotional exhilaration, by loquaciousness and by apparent ease in thinking. In a mild form the maniacal state is evidenced by a distractibility, viz a constant flitting of the attention from one thing to another. The flighty character is one supposed to result by exaggeration in maniacal excitements. In the acute form of the disease the excitement is manifested by great activity, motor and mental, by false ideas of power and by exorbitant exhilaration. On account of the prominence of the exaggerated ideas of power the patient is led to perform certain acts which he would not do under normal conditions. The exaggerated feeling of well-being and power leads to ideas of wealth and superiority, and these at times attain an absurd character like those in paresis. The mental exhilaration often leads to the enunciation of words corresponding with the course of ideas, with little or no apparent connection, and in extreme cases there may result an apparent verbal confusion or incoherence similar to that in dementia precox.

Since mania is only one form of manic-depressive insanity, it sometimes alternates with melancholia (*q.v.*), and at times the symptoms are complex, including the principal ones of mania and others usually associated with melancholic states. Thus we find forms of mixed mania, which are called maniacal stupor and unproductive mania. The disease is believed to arise from an hereditary taint, but is curable or recoverable. On the other hand, it is recurrent, attacks appearing throughout the life of the individual at more or less regular intervals. It may alternate with the depressed form of manic-depressive insanity, and result in the circular types (see CIRCULAR INSANITY).

From the psychological and pedagogical

side, this diseased condition is of interest for two reasons. First, it commonly begins in childhood or in the adolescent period, the first attack being of short duration. As a rule, in the later successive attacks the duration is increased. Secondly, the symptoms are considered to be typical exaggerations of the normal reactions of the individual. The early beginning is at times correlated with the stresses of school life, the attacks (although the statistics are meager in this point) beginning more frequently during the second half of the school year. The excitement is considered by some authors, with good reason, to be simply exaggerations of the normal excitability of the individual. It is believed that the child who is normally excitable will, under stress, develop maniacal symptoms, while the usually morose and depressed child will develop the depressive symptoms when he or she becomes abnormal. The curative methods employed are those of rest, etc., and these must be kept in mind by the teacher.

MANITOBA SCHOOL CASE. — A legal and constitutional case of great importance in the history of the struggle between denominational and public schools. Under §22, 1, of the Manitoba Act educational affairs were left to the Manitoba Provincial Legislature, provisos being added for the safeguarding of denominational interests, for an appeal in case of dispute to the Governor-General in Council, and finally for control by the Dominion Parliament through remedial laws. From 1871 to 1889 a system of denominational education existed by which Catholics and Protestants maintained their own schools. But as in course of time the character and distribution of the population changed so that there were many denominations entirely unprovided with schools, and as it was felt that a homogeneous educational system was desirable, a law was passed in 1890 establishing a government Department of Education, and Advisory Board with full control over state and rate-aided public schools; books and religious exercises were to be ordained by the Advisory Board; and religious exercises were to be nonsectarian and

optional. This law was at once attacked by the Catholics as a violation of their rights and privileges under § 22, 1, of the Manitoba Act. A test case, the Barrett case, was brought to court and carried through to the Judicial Committee of the Privy Council in England in 1893, but the decision was against the Catholics on the ground that no denominational or other schools had existed before the Act. In the meantime a petition was drawn up by the Catholics appealing to the Governor-General to protect their rights and privileges acquired since 1870, and complaining of the injustice of taxing Catholics to maintain what to all intents and purposes were Protestant schools. This appeal became the subject of litigation, and in 1895 the Judicial Committee of the Privy Council in England decided that an appeal lay to the Governor-General in whose jurisdiction it was to make some remedial order. A Remedial Order was issued in 1895 by which Catholics were permitted to maintain their own schools, were to share in any public grant to education, and were to be exempted from supporting any other schools. The province refused to obey the order, and the Dominion government took up the matter, but without taking any decisive action. At the general elections in 1896 the Liberals were returned in a large majority, the separate schools question forming an important part in the struggle. A compromise was put forward by Sir Wilfrid, then Mr., Laurier, Dominion Premier, and Mr. Greenway, Premier of Manitoba, by which a clergyman or authorized religious teacher was to be given access to Catholic schools to give religious instruction, and where the numbers permitted a Catholic teacher might be employed. The Catholics refused to accept any arrangement which did not give them their own school. The Pope was invited to send an Apostolic Delegate to consider the situation, but the Manitoba Government legalized the Laurier-Greenway compromise before he arrived. This law (the Public Schools Act, 1897) is the basis of the present system.

MANITOBA, UNIVERSITY OF, WINNIPEG, MAN. — A provincial university established by the Manitoba legislature in 1877.

Six colleges are affiliated with the university. Courses are offered in arts, medicine, engineering, law, pharmacy, and commerce, all but the last leading to their respective degrees. The enrollment in 1910-1911 was 744. The faculty consists of twenty-three members.

MANN, HORACE (1796-1859). — American educator and statesman. He was born at Franklin, Mass., the 4th of May, 1796, and received the rudiments of his education in the district schools, being prepared for college by an itinerant schoolmaster. He entered Brown University in 1816, and was graduated three years later. He was two years tutor at Brown, when he took up the study of law at Litchfield, Conn. In 1823 he was admitted to the bar of Norfolk County, Mass., and during the next fourteen years he was engaged in the practice of law and in legislative labors. He was for six years a member of the house of representatives of Massachusetts and three years a member of the state senate. In the latter body he was directly responsible for the enactment of four important acts: (1) a law against the use of alcoholic beverages; (2) against the traffic in lottery tickets; (3) the establishment of state hospitals for the insane, and (4) an act creating the State Board of Education.

The new board was given power to select a secretary who should have the general oversight of the schools of the commonwealth. It was through the persuasions of his friends Edwin Dwight and Governor Edward Everett (*q.v.*) that Mr. Mann was induced to give up the profession of law and undertake the reorganization of the Massachusetts school system. His task was by no means an easy one. The growth of the district school system and the extension of private schools had greatly weakened the efficiency and influence of the public schools. He entered upon his new duties in June, 1837. He wrote to a friend: "My law books are for sale. My office is to let. The bar is no longer my forum. I have abandoned jurisprudence, and betaken myself to the larger sphere of mind and morals."

As secretary of the State Board of Education, Mr. Mann's first effort was to educate public opinion with reference to the needs and purposes of public education. The lyceum movement (*q.v.*) had made public lectures popular, and he laid under tribute brilliant clergymen, distinguished lawyers, prominent men of letters, and well-known college professors as speakers at the hundreds of public meetings held throughout the commonwealth. Through these public meetings he literally stirred the thoughts and feelings of the entire state, and made possible subsequent legislation which led to the reestablishment of a common school system in Massachusetts.

His next important reform was the improvement of the teaching force of the state, and this he accomplished by the organization of

A GROUP OF AMERICAN EDUCATORS.

teachers' institutes (*q.v.*) and the establishment of state normal schools. For his institutes he secured the best available instructors of subjects taught in the common schools, as well as lecturers on the art of teaching and the professional aspects of education. But he early recognized the need of more extended training for teachers; and through the generosity of his friend Edmund Dwight he was enabled to make the experiment of special schools for this purpose. Two normal schools were accordingly organized — at Lexington (now Framingham) and Barre (now Westfield) — before the end of his second year; and during his third year another school was opened at Bridgewater. Through these normal schools, and similar institutions subsequently organized, Mr. Mann demonstrated to the people of Massachusetts the value of better trained teachers; and the state assumed the entire responsibility of the normal schools.

Another important feature of Mr. Mann's labors was the collection and diffusion of information concerning the actual condition of public education. A law of 1826 had required of the school committees in the different towns of the commonwealth annual statements concerning school attendance, expenditures, etc.; but little use had been made of such returns. In Mr. Mann's hands they became "powerful instruments in educating the public," and they formed the framework of the twelve reports that he issued during the period of his secretaryship of the Massachusetts State Board of Education. These reports were issued as public documents and widely distributed; and more recently Mr. Mann's son has issued an abridged and edited edition of the same in four volumes (Boston, 1891).

The twelve reports on the condition of education in Massachusetts and elsewhere, together with his discussions of the aims, purposes, and means of education, occupy a commanding place in the history of American education. The first report deals with the construction and hygiene of schools — ventilation, heating, seating, and playgrounds — and the physical factors in school life; the duties and responsibilities of school committees; the enforcement of school attendance laws, and the needs of higher standards in the teaching force. The second report is devoted largely to the course of study and to a discussion and criticism of the current methods of teaching reading, spelling, and composition. Mr. Mann was strongly opposed to the alphabetic method (*q.v.*) of teaching reading, and he warmly endorsed the word method. The question of child labor (*q.v.*) and the dangers of employing young children in factories formed an important part of the third report. In the same report he discussed the importance of school libraries and the formation of reading tastes during the school course. The district system (*q.v.*), "entrenched behind statutory rights and im-

memorial usage," was the burden of the fourth report. Mr. Mann was convinced that "no substantial and general progress could be made so long as the district system existed"; and during his remaining eight years in office he "kept up a continuous fire of argument, entreaty, fact, philosophy, statistics, and testimony." But it required thirty years more to complete the work of reform in this direction.

The fifth report is essentially a pedagogic document. Mr. Mann discusses the teacher, normal schools, pedagogical books, educational journals, school management, corporal punishment, and the relation of the State to education. One of his biographers holds that in his fifth report Mr. Mann reached the climax of his power and success and that it was received at home and abroad in the spirit of highest appreciation (Hubbell). He established in 1838 the *Common School Journal*, ten volumes of which were issued during his secretaryship, and after his retirement William B. Fowle (*q.v.*) became its editor and publisher. The sixth report reverts to the course of study and more particularly to its enrichment, and it contains one of the earliest exhaustive American discussions of the educational value of the study of physiology and hygiene.

In May, 1843, Mr. Mann went to Europe, where he spent five months in the study of educational conditions in Great Britain, Belgium, Holland, France, Germany, and Switzerland. His seventh report embodied the results of his educational tour abroad, and it was the pretext for an attack upon Mr. Mann by the schoolmasters of Boston. His praise of European schools, and particularly his commendation of oral instruction, the word method in teaching reading, and the abolition of corporal punishment in Germany, wounded the sensibilities of the Boston schoolmasters, and a bitter controversy ensued, during which time twenty-five pamphlets were printed attacking and defending Mr. Mann. As Mr. Hinsdale remarks, "The controversy attracted much attention, and made a deep impression on the public mind. It had much to do with fixing Horace Mann's place in educational history. The champion of the new régime had met the champions of the old and overthrown them in the arena of public debate."

In his eighth report Mr. Mann discusses the value of local and county educational associations, the value of vocal music in the elementary schools, and the use of the Bible in schools. It will be recalled that it was through the aid given Lowell Mason (*q.v.*) by Mr. Mann that singing was made a feature of public school work. The ninth report urges the employment of women teachers in the primary schools, the value of teachers' institutes, and the place of moral instruction in public education. The tenth report is a history of the Massachusetts school system. The eleventh report discusses the relation of education and crime, and the

twelfth report — prepared after Mann had resigned his secretaryship — reviews the changes in education in Massachusetts during the past twelve years, and discusses the problem of education for defective and dependent children.

In 1848 Mr. Mann was chosen a member of Congress from Massachusetts to succeed John Quincy Adams. He served in this capacity for five years, full of eventful history. In 1853 he became the first president of Antioch College (*q.v.*), which position he filled until his death on Aug. 2, 1859. His educational writings include the twelve reports as secretary of the Board of Education of Massachusetts (Boston, 1838-1849), editorials and articles in the *Common School Journal* (1838-1848), *Lectures on Education* (1848), and numerous papers in Barnard's *American Journal of Education* and the *Proceedings of the American Institute of Instruction*. Extracts from his reports and addresses have been published by his son, George Combe Mann (Boston, 1891, 4 vols.). No American educator has been more widely discussed than Horace Mann. Five different works dealing with his life have been published in the United States, three in France, two in Spanish countries, and one in Italy. W. S. M.

MANN, MARY PEABODY (1806-1887). — Wife of Horace Mann, was privately educated. She was associated with her husband in his public school reforms, and with her sister, Elizabeth Palmer Peabody (*q.v.*), in the organization of kindergartens in Boston. She wrote *Life of Horace Mann* (Boston, 1865; republished 1891), and was joint author with Miss Peabody of *Culture of Infancy* (Boston, 1863)

W. S. M.

MANNERS AND MORALS, EDUCATION IN. — A term of peculiar significance in

Renaissance and post-Renaissance education, when there was formed a combination of chivalric and formal literary education. Then a direct training in manners and formal morality became an essential part of the dominant education. The importance of conduct had been stressed in educational thought and practice from earliest times. Oriental education, in its various types, is largely training in formal conduct, often having little or no relation to moral principles of fundamental importance. With both the Greeks and Romans conduct was the essential product of education, and within the scope of conduct striven for by formal education was much which could be included under manners. During the middle ages a sharp division existed between the literary education of monks and ecclesiastics, and the education in conduct and manners of the nobles and gentry. With the Renaissance these two types were fused, with the result that the gentry aspired to a literary education, which indeed in time came to be the test of gentility, and on the other hand the Church insisted on broadening the scope of morals to include formal manners. Still, while many of the treatises on manners were written by churchmen, most of them found their inspiration in the traditions of chivalry, and the earlier works were direct contributions to chivalric education (See CHIVALRIC EDUCATION; GENTRY AND NOBLES, EDUCATION OF; RENAISSANCE, EDUCATION DURING THE; SOCIAL REALISM.)

The baronial system developed the plan of education in noblemen's houses (see CHIVALRIC EDUCATION), especially in the houses of the Chancellors of the Kings, in whose hands the court patronage lay. In this training the cultivation of manners and morals took a prominent place. The late Dr. Furnivall brought together in the *Babes Book* (Early English Text Society) the following manuals: *The Babes Book* or a "Lytyl Reporte" of *How Young People should behave*, c. 1475 A.D.; *The A B C of Aristotle*, c. 1430 A.D.; *Urbanitas*, c. 1460 A.D.; the *Lytylle Childrens Lytyl Boke*, c. 1480 A.D.; the *Young Childrens Book*, c. 1500 A.D.; the *Stans Puer ad Mensam*, attributed to John Lidgate, c. 1460 A.D.; *How the Good Wife taughte her Doughter*, c. 1430; *How the Wise Man taught his Son*, c. 1430. More comprehensive treatises are the following. (1) *The Boke of Nurture, or School of good manners, for men, servants, and children . . . necessary for all youth and children* by Hugh Rhodes of the Kinges Chappell, 1577. (2) *The Boke of Nurture following Englyndis gise*. By one, John Russell once usher of the chamber and marshal in hall to Humphry Duke of Gloucester. (3) *The Boke of Keryngge*, printed by Wynkyn de Worde, 1513. (4) *The Booke of Demeanor and the Allowance and Disallowance of certain Misdemeanours in Companie* (taken from Richard Weste's *Schoole of Virtue*,

1619). (5) *The Boke of Curtasye*, c. 1430 A.D. Sloane Ms., 1986, Brit. Mus. (6) Bishop Grossetest's *Household Statutes*, c. 1450. (7) *The Schoole of Virtue and booke of good Nourture for children and youth to learne theyr dutie by. Newly Augmented by the author F. S* [eager], 1557. (8) *A Series of Latin Graces*

Further, Dr. Furnivall enriched his book with a collection of French and Latin poems on Manners and Meals. An Italian series of *Books of Courtesy* was edited by W. M. Rossetti in 1869. The most finished of all these Courtesy books was Baldassare Castiglione's (*q.v.*) *Cortegiano* in 1528. Miss A. T. Drane (*Christian Schools and Scholars*, 1881) gives an account of English Education in the fourteenth century, and quotes the rules for the household drawn up by Elzéar de Sabran, in Puy-Michel in Provence, anticipating the training in morals and manners of a household like that of Sir Thomas More at Chelsea. With regard to schools, we have the classical maxim of William of Wykeham in founding Winchester College (1393) that "Manners maketh Man." In the directions issued to the Master of the Henxmen, who had the training of the young gentlemen of the Court of Edward IV, he was required "to shew the schools of urbanitie and nourture of England . . . to have all courtesy in words, deeds and degrees," and diligently to keep them in all rules of precedence, and it was his special business to sit with them in hall, and "have respect to their demeanings." Esquires were appointed to keep the young henxmen (*i.e.* the children sent to the King's court for training) "honest company . . . in talking of Kings and other policies." This talking and telling of tales, though the medieval romance was condemned by writers like Erasmus and Vives, in whose time it had become a source of corruption, was a recognized method of moral culture, in accordance with the idea of the times, *e.g.* one of Caxton's productions was, in 1484, "the translation of Geoffroy de la Tour Landry's *Book of Fayre Ensamplis and then-syngementys and techyng of his daughters* originally written in 1371. The stories are composed with the idea of inciting to good conduct, and are taken, some from the Scriptures, some from the lives of Saints, others from popular tales. They show the idea of the moral training of the women in the age.

It is interesting to note here and refer for further details to the article on JEWISH EDUCATION that a large number of Hebrew books of morals appeared in the eleventh, twelfth, and later centuries dealing as much with the manners in general intercourse and table manners as with the conduct of the religious man.

Turning to the Renaissance textbooks of manners and morals, the subject claimed the attention of Juan Luis Vives (*q.v.*) in his *Introductio ad Sapientiam*, his *Satellitium*, and his two epistles *De Ratione Studii puerilis*, all published at Louvain in 1524. *Pietas literata*,

a title which has been appropriated as the aim of Sturm, certainly was as marked in Vives. As Sir Richard Moryson, the English translator (1540) of the *Introductio ad Sapientiam* says, the collection of precepts therein contained are calculated to root the love and desire of virtue in the pupil's heart, "extirpating from it all manner of vice." It is, in fact, a treatise of Christian morals, for the young pupil, consisting of maxims or aphorisms. The *Satellitium*, which Vives dedicated to Princess Mary, daughter of King Henry VIII and Catherine of Aragon, was to be a "body guard," not like that of the old emperors, against attacks on the body, but his symbolical maxims (some 200 in number) would preserve the princess child, by admonitions, from all vices and faults. In the *De Ratione Studii puerilis*, Vives requires the pupil to learn the *Distichs* of Cato, the *Mimi* of Publilius Syrus, the *Sentences of the Seven Wise Men*, as edited by Erasmus (1513). The child is bidden to take pleasure in stories which teach "the art" of life — such as those of the boy in Aulus Gellius, Joseph in the Holy Books, of Lucretia in Livy, Griselda, and so on. The authors to be read are chiefly medieval Christian poets such as Prudentius. The use of medieval Christian moralist poets was enjoined by Colet's Statutes (1518) for St. Paul's School, and by the Statutes (1583) for St. Ewen's School. Right on from Chaucer to Vives it should be possible to be said of the pastor and teacher — as Chaucer said of the Clerk of Oxenford, "Souninge in moral vertu was his speche."

Of the many foreign books of moral maxims, a typical one may be named, printed at Lyons in 1576 in French and Italian, entitled *Trésor de Vertu O Tresoro di Vertu*, in which are contained all the noble and excellent sentences and instructions of all the first authors, Hebrew, Greek, and Latin, to lead each one to a good and honorable life.

Wider in circulation than Vives' *Introductio ad Sapientiam* was the *De Civilitate Morum puerilium* (1526) of Erasmus. He states in the Preface that the first element in the instruction of children is the awakening of the child to piety, the second, to learning, the third, to the duties of life, and fourth, to be cultivated from the earliest age, in the rules of civility. It is becoming for a man to control his deportment, his gestures, his clothing, as well as his intelligence. Those who represent the cause of learning must be noble, and ought therefore to show the fruits of courtesy and good breeding. Erasmus proceeds in detail to describe the essential characteristics of good manners and morals in chapters on graceful bearing, clothing, behavior in church, at meals, in meeting others, at games, and on going to bed. Erasmus points out that we cannot choose our fatherland, or our parents, but every one can acquire good qualities and manners. Led by Vives and Erasmus, the Renaissance writers endeavored to win manners and morals, for

the young scholar, not away from, but as common ground with, the nobles and gentry. Thus Lawrence Humphrey (*q.v.*) in the *Nobles*, 1560, requires the reading of Erasmus's *De Civilitate* by the young nobles, while in 1568 Dean Nowell's Statutes at Bangor prescribed the same book of Erasmus for the Third Form. There is an instance in 1588 of the Headmaster of the King's School, Canterbury, Anthony Short, being admonished by the Dean and Chapter "to have a greater care and to be more diligent than he hath been, that his scholars may better profit in learning as well as good manners and civility than late they have done."

Erasmus's book was widely circulated abroad, and was translated into English and published in 1532, by Robert Whittington, poet laureate, as *A lytil Booke of good maners for children*. In England, however, William Lily's lines on Manners and Morals (*De Moribus*) were read, and ordinarily learned by pupils in the authorized grammar. Manners and morals formed an important element in the Colloquies and in other textbooks, as, *e.g.* in Coote's *English Schoolmaster*, 1596. In 1633 John Clarke of Lincoln Grammar School wrote his *Dux Grammaticus*, in which is curiously included a treatise on manners, which he regards as an indispensable part of grammar school training, so that the boy shall perform his religious duties, his duty to his fellows and to himself, in the house, at table, to visitors, and to superiors of all kinds. One of the well-known books of the Jesuits was on this subject, viz. *Youths Behaviour, or Decency in Conversation amongst Men. Composed in French . . . now turned into English by Francis Hawkins, Nephew to Sir Thomas Hawkins, translator of Caussin's Holy Court*. 4th ed., 1646. This book is said to have been translated by the child at eight years of age. The original was by La Flèche: *Bien-séance de la Conversation entre les hommes*, 1595, and had been translated into Latin, 1617, by Leonard Périn. (See GENTRY AND NOBLES, EDUCATION OF.) Charles Hoole (*q.v.*) recommends the book as well as Erasmus' *De Civilitate*, for he explains that in a school the "sweet and orderly behaviour of children" brings more credit than even sound teaching, "because this speaketh to every one that the child is well taught, even if he learn" but little else.

In addition to the requirement of the teaching of Manners and Morals by the private tutor in the nobleman's family, and in the private as well as in the public grammar schools, the still more important training in the ordinary home and household must be borne in mind. In 1537 Richard Whitford wrote *A Worke for Householdiers* in which the full details are given especially in connection with morals, to be inculcated into the household adult, child, family, and servants, and a treatment is given of lying, oaths, conduct at church, on the Sunday, and of due reverence and respect to parents.

Whitford was a Roman Catholic, but the same type of textbook was sanctioned by the Protestant Puritans, *e.g.* by Robert Cleaver and John Dod in 1612, giving full details as to the duties of husbands and wives, parents and children, masters and servants. William Gouge, in his *Of Domesticall Duties*, 3d ed., 1634, takes the highest ground for the inculcation of good manners in the child, viz. that "not only heathen men, but also the Holy Ghost Himself hath proscribed many rules of good manners." Still more interesting is the treatise of Hezekiah Woodward: *A Child's Patrimony laid out upon the Good Culture or Tilling over his Whole Man* (1640), one of the most interesting educational works of the seventeenth century especially from the moral side. The *Gentleman's Calling*, c. 1660, and the *Ladies' Calling* (c. 1673), and Clement Ellis's *Gentle Sinner* (1660) abound in the treatment of the training of Manners and Morals, and substantially all the writers on educational theory and practice in the seventeenth and eighteenth centuries deal with the subject. It will be recalled that Daniel Defoe (*q.v.*) wrote a book which had enormous circulation in the eighteenth century, called the *Family Instructor*, continuing the series of manuals for practical treatment of the relations of fathers and children, masters and servants, husbands and wives. Throughout this class of book the Bible is the basis; for a great mass of practical household treatises are founded on the Ten Commandments.

Otherwise the sources from which the manuals for manners and morals were drawn were mainly detached sayings of Solon, Pythagoras, Theognis, Phocylides, Cicero, Cato, Seneca, and of course, Plutarch, Plato, and Aristotle. (Golding made his translation of Seneca's *Beneficia* in 1577.) The permeating influence of Aristotle's *Ethics* joined with the Christian view can be best seen in the noble plan of the *Faerie Queene* of Edmund Spenser (*q.v.*), 1590-1596, which "is disposed into twelve books, fashioning XII. morall virtues," of which he only wrote on six, viz. holiness, temperance, chastity, fidelity, justice, and courtesy. Substantially, the *Faerie Queene* is an educational moral treatise. Nor were suggestions for practical training in manners and morals wanting. In another less known Utopian romance, the *Nova Solyma*, 1648, first translated into English by Walter Begley in 1902, the father in placing his son with the best of tutors says he will not only be made proficient in the liberal arts, but also in the "true moral virtues," and to become a "good man" is the "greatest blessing you can have." The methods of training are described. Pupils are required to practice letter-writing to men of various ranks, to study the best word and gesture in ordinary intercourse, and the most appropriate language for disputing, joking, rebuking, etc. "They have to go through all this in character as on the stage." George Snell in the *Right Teaching of*

MANNHEIM SYSTEM

Useful Knowledge (1649) suggests that the child should be trained to act the taking of messages courteously, the making of an obeisance, and the *going through* of what is required in their childish duties in preparation for the right performance of the actual duty itself. The religious sanctions for manners and morals in the Sabbath observances, long sermons, catechisings, learning by heart of Scriptures, exercise of parental and pastoral authority, made Puritanic training in morals *practical*; the eighteenth and early nineteenth century moral stories and goody-goody tales were the literary survival of an older, stern, and unceasing discipline in school and home. This aspect of the subject is treated further under LITERATURE, CHILDREN'S; while the modern status of the entire subject is considered under MORAL EDUCATION.

MANNHEIM SYSTEM. — See GERMANY, EDUCATION IN.

MANNING, JAMES (1738-1791). — First president of Brown University. He studied at Hopkins Academy, and was graduated from the College of New Jersey (now Princeton) in 1762. After spending a brief period as a traveling evangelist, he opened a Latin school at Warren, R.I., which in 1765 became Brown University. Five years later it was removed to Providence. Manning served as president of the institution until his death in 1791. At the same time he was pastor of the Baptist church in Providence that had been founded by Roger Williams. He was a delegate to the Continental Congress in 1785-1786, and he led the movement which secured the adoption of the constitution by Rhode Island. He was also active in the movement looking toward the establishment of a public school system, and his most important educational publication is *Report in Favor of the Establishment of Free Public Schools in the Town of Providence*. MANUAL LABOR INSTITUTIONS

MANSFIELD, JARED (1759-1830). — Textbook author. He was graduated from Yale College in 1777, and taught for many years in New Haven and in the Friends' Academy at Philadelphia. He was also instructor in the military academy at West Point (1802-1828). He wrote a series of mathematical textbooks. W. S. M.

MANTUA. — See VITTORINO DA FELTRE.

MANTUANUS, BAPTISTA SPAGNUOLI (1448-1516). — Humanist author of Latin poems which for a time seem to have had a greater vogue than the classical works. His chief work was *Bucolica seu Adolescentia* (1502), of which numerous editions soon appeared abroad and in England. Though styled eclogues, only two of the poems deal with rural life. The work early became a popular school textbook, and editions were issued giving parallel passages from the classics. The eclogues were imitated in English as early as 1514 by Alexander Barclay; they were translated by Turberville in 1567, and imitated again by Spenser in *Shepherd's Calendar* (1587). It was recommended for school use by Colet, and was prescribed by statute in several schools. Spagnuoli is the "good old Mantuan" quoted by Holofernes in Shakespeare's *Love's Labour's Lost*, IV, ii, 95.

MANUAL ARTS. — See MANUAL TRAINING; also INDUSTRIAL EDUCATION; TECHNICAL EDUCATION.

MANUAL LABOR INSTITUTIONS AND THE MANUAL LABOR SOCIETY. — The movement for the organization of manual labor schools in the United States began about 1825, and drew its inspiration chiefly from the work of Fellenberg (*q.v.*). Such schools were organized in Connecticut in 1819, in Maine in 1821, in Massachusetts in 1824, in New York in 1827, and in New Jersey in 1830. The purpose was to unite training in agricultural and mechanical pursuits with the ordinary school studies. (See AGRICULTURAL EDUCATION.) The Oneida Manual Labor Institute, at Whitesboro, N. Y., was in existence from 1827 to 1834. A part of the day was devoted to work in shops and fields, and the remainder of the day to classroom work in the English branches. George W. Gale (*q.v.*), the director of the institute, aimed to make his institution largely self-supporting through the results of the boys' labors.

The Manual Labor Society for Promoting Manual Labor in Literary Institutions was

organized in New York in 1831 for the purpose of "collecting and diffusing information calculated to promote the establishment and prosperity of manual labor schools and seminaries in the United States, and for introducing the system of manual labor into institutions now established without diminishing the standard of literary and scientific attainments." Zachariah Lewis was the first president, and Theodore Frelinghuysen and Jeremiah Day were the vice-presidents. Theodore F. Weld, who had been connected with the Oneida Manual Labor Institute, was engaged as field agent.

The arguments in favor of manual labor schools, as opposed to purely literary institutions, were thus stated by the society: (1) they provide a system of education that is natural; (2) they interest the mind; (3) they have good moral effects; (4) they train in habits of industry, independence of character, and originality; (5) they render prominent all the manlier features of character; (6) they give power for acquiring a knowledge of human nature; (7) they greatly diminish the cost of education; (8) they increase the wealth of the country; and (9) they tend to do away with absurd distinctions in society. The first annual report of the society was published in 1831 (120 pp.). This, however, was the last, for the society soon disbanded on account of lack of interest in the movement and the opposition of existing literary institutions. Thus the manual training movement in the United States was deferred for a half century. (See MANUAL TRAINING.) The society was also active in the matter of gymnastics in schools; and in no small measure the credit for the early recognition of this form of physical training in American schools is due to the Manual Labor Society. (See GYMNASTICS.)

MANUAL TRAINING. — In spite of many objections, the term "manual training" has come to be generally applied to all forms of constructive handwork when used as an agent in general education. When used in the broadest sense, instruction in domestic art and science, and constructive work in various materials in the lower grades are included. In a narrower conception, the term is restricted to work with mechanical tools given to boys. The tendency in American usage is to distinguish sharply between manual training as a feature of general education and specialized tool instruction given to selected groups for purely vocational ends.

Place of Manual Training in the various National Systems — Manual training was first recognized as a valuable feature of school work in European countries. As early as 1858 Otto Cygnaeus, who later organized the public schools of Finland (*q.v.*) on a modern basis, outlined a plan of handwork for the primary

schools of that country, and in 1866 some form of manual work was made compulsory in all primary schools for boys in country districts as well as in the training colleges for male teachers.

It was Sweden, however, that took the most active part in the early development of manual training. In 1872 the government reached the conclusion that schools for instruction in sloyd were necessary to restore the waning physical and moral health of the nation due to the tendency towards concentration in cities, and the decline of the old home industries. The schools first established dealt with various lines of the old Hus Slöjd occupations, such as carpentry, turning, wood carving, brush making, bookbinding, coopers' and wheelwright work, and exhibited more of an industrial than a cultural plan. This was gradually changed, however, as the movement gained headway, until a well-organized scheme of educational tool work for boys between twelve and fifteen years of age, aimed mainly at the production of domestic utensils, was developed into a recognized school sloyd system. In 1877 the work was introduced into the Folk Schools as a voluntary subject, and government aid was granted in support of the instruction. A sloyd school was established at Naas in 1872 for teaching boys and young men. Three years later a second school, known as the Sloyd Seminarium, was organized under the direction of Herr Otto Salomon for the training of teachers. This institution has been a very active and stimulating force in the development of manual training in Sweden, and particularly through its summer courses for teachers it has exercised a strong influence upon the thought and practice of other countries. At the present time, sloyd instruction is given in all regular normal schools of the country.

Interest in the principle of manual training developed early in France. In 1873 the Ecole Salicis was established at Paris, in which constructive work in various forms was made an important feature of the curriculum. Manual training was made compulsory in the elementary primary schools of the country by a law in 1882, but the provisions of this law are, even at the present time, only partially realized because of the failure of the communes to provide workshops. Almost from the first, French educators developed a system of instruction for every grade of the elementary schools. Such schemes have been characterized by variety of materials and processes, by their close dependence upon drawing, and by a precise mathematical and rather formal quality. A distinctive feature in the French shopwork of the upper grades is that the theoretical instruction is given by the classroom teacher while the practical instruction is given by artisan teachers. The largest development of manual training in the elementary school is

to be found in the city of Paris, where nearly 200 schools are equipped either with wood-working shops or with metal-working shops.

In Germany an active propaganda in manual training has been maintained for many years, but as yet comparatively little has been accomplished towards incorporating manual training into the work of the common schools. A large number of workshops have been established in various parts of the Empire, which are in many cases supported by individuals or societies. Instruction in these shops is in most cases given outside of school hours on an optional basis. In a few cases, as in Munich, the work is given during the regular school day and is obligatory. The ministries of several of the German states make annual contributions in aid of manual instruction, but the work still depends to a considerable extent upon private or corporate support. Manual work for girls in the form of needlework, on the other hand, has for a long time been compulsory in the common schools of Germany. Work in cookery for the older girls is now appearing in a number of places. Courses in paper, cardboard, and pasteboard, as well as in wood and metal, are features of the German scheme of manual work, and the making of simple apparatus for scientific instruction is common. The Manual Training Seminary at Leipzig, founded in 1887 by the Association for Manual Training for Boys, under the leadership of Dr. Waldemar Goetze, is the active center of the movement in Germany. This seminary is the main institution for the training of teachers, and a large proportion of those teaching shopwork in Germany have attended its summer courses.

In England the development of manual training dates from about 1887, when centers of shopwork were established in the London schools. The Board of Education for England and Wales awards special grants for manual training instruction given to boys and girls at least eleven years old. Teachers are required to possess certificates either of the City and Guilds of London Institute or of the Educational Handwork Association. Teachers' certificates issued by the former body are accepted as a qualification for teaching shopwork by the Board of Education of England and Wales, by the Scottish Education Department, and by the Department of Agricultural and Technical Instruction for Ireland. In the years 1892-1911 the institute granted certificates to 5240 teachers of woodwork and to 501 teachers of metal work. English manual training in the elementary schools is generally a reflection either of the Swedish sloyd or an exercise and project system developed by teachers who have received practical training in the trades. At the present time, manual training is represented as a compulsory feature in the schools of almost all the large cities of England. In London

in 1910 there were 240 centers at which instruction was afforded to some 60,000 boys.

In the United States, manual training came into being partly as the expression of a new educational philosophy and partly from dissatisfaction on the part of the public with the results of the purely bookish curriculum of the schools. The first appearance of constructive work for clearly definite cultural purposes appears to have been in connection with the classes of the Workingmen's School founded in 1878 by the Ethical Culture Society of New York. This institution comprised a kindergarten and elementary school in which manual work from the first formed a vital and important part of the educational program. It was, however, in the secondary school that manual training first gained serious attention in American education. In 1880, through the efforts of Dr. Calvin A. Woodward, the St. Louis Manual Training School was opened in connection with Washington University. This school was a completely equipped high school, giving instruction in various lines of shopwork and in mechanical drafting, as well as in the regular secondary school subjects, with exception of the classics. The work of this school attracted wide attention, and the success with which mechanic arts instruction had been incorporated in the curriculum led to the rapid organization of similar schools in other large cities. In Chicago, Toledo, Cleveland, and Cincinnati privately supported schools were organized from 1884 to 1886, and public manual training schools were established in Baltimore in 1884, Philadelphia 1885, and Omaha 1886. The first provision for girls' work in these schools was made in the case of the Toledo Manual Training School, and included sewing, dressmaking, millinery, and cooking. The shopwork instruction given in these institutions comprised joinery, turning, pattern-making, forging, and machine work, and sometimes foundry practice and tinsmithing. The character of this work has been very similar in different schools, and until late years has been almost uniformly based upon the principles of the "Russian System," so called because the ideas involved first gained recognition in the United States through the exhibit of the Imperial Technical School of St. Petersburg at the Centennial Exhibition in 1876. The central idea of this system of shopwork instruction which was developed in a technical school for the instruction of engineers, is the analysis of a craft into its fundamental processes and typical constructions, and the presentation of these elements in an orderly and sequential scheme as separate exercises.

The rapid development of this type of secondary school, which has continued steadily since its inception, has resulted in an

institution peculiarly American. In other countries the introduction and spread of manual training has been confined to the elementary school, and no institution exists in Europe of a purely educational character that represents any parallel to the comprehensive and costly equipment of these schools, nor, it should be said, to their rather vague and indefinite educational status. Established with the double purpose of affording a more liberal and realistic training for boys of secondary school age, and of developing capacities for industrial careers, the records show that apart from the large number that go forward into engineering schools, only a trivial percentage of graduates from manual training high schools enter directly into industrial work, and that this small number go almost wholly into the "white shirt" occupations of draftsman or administrative assistant. Of late years a tendency has become apparent to intensify the industrial side of the curriculum in such schools, and to transform them into technical schools with a definite vocational basis. (See INDUSTRIAL EDUCATION.)

It was not until between the years 1887 and 1890 that manual training reached the public elementary school. Experimental classes in carpentry, the expense of which was borne by Mrs. Quincy A. Shaw, were conducted at the Dwight School in Boston in 1882. These were taken under the care of the city and transferred to temporary quarters in the English High School building in 1884, but the work was not given a place in the course of study until 1888. In Springfield, Mass., sewing was introduced in the schools in 1884, and in 1886 a manual training school was established, at which pupils coming voluntarily from the elementary schools were given instruction in knifework. In 1885 the Legislature of New Jersey passed a law providing that the state would duplicate any amount between \$500, and \$5000 raised by a city or town for instruction in manual training. This led to the early introduction of the work in a number of places in various parts of the state, first of all in Montclair. In New York City the Industrial Education Association was established in 1886 for the purpose of providing instruction in manual training for boys and girls in voluntary classes, and two years later was organized as a college for the training of instructors to undertake the task of supplying teachers for the new field. In 1888 the city of New York began the introduction in the public schools of a manual training course of study, including drawing, sewing, cooking, and woodwork.

Content of Course—The early work in manual training in the elementary school was almost uniformly limited to the two or three upper grades, and consisted of shopwork for boys and sewing and cooking for

girls. From these grades handwork slowly made its way downward, and at the present time such work, dealing with a variety of materials, is given in all grades in many of the larger cities. The report of the Commissioner of Education for 1910 states that in more than seven hundred cities of the United States, public schools have manual training in several years of the course, generally in the elementary grades, but frequently in all the years from kindergarten through the high school.

Educational Value. Underlying Theory.—In the early agitation for the introduction of manual training in the eighties, the claims put forward for the new subject as evidenced in the discussions of the National Education Association, and particularly in the meeting of the Department of Superintendence in 1888, were in the main based on the conception of formal discipline. Manual training was entitled to a place in the school because it exercised the observation, trained the reasoning powers, and strengthened the will. Although it is doubtless true that public support of the new movement was due to a vague but sincere conviction that the introduction of handwork stood for industrial training, educators as a rule most carefully refrained from advancing a claim for utilitarian value in the work, and all utterances were for the most part expressed strictly in terms of the prevailing faculty psychology.

The early practice of manual training in the elementary school was experimental and formal. The type exercise was the universal form in which handwork appeared, and it was not until the influence emanating from the Sloyd School of Boston (established in 1888) began to be felt that toolwork for boys assumed a more invigorating form. The fundamental principle of sloyd, which places emphasis on the value of working for a useful end, and so enlisting the interest of the worker, soon found acceptance in the general practice in the elementary school, and to a certain extent modified the methods of the manual training high school.

About this same period, the doctrine of formal discipline began to lose its place as the cornerstone of manual training philosophy. By the beginning of the present century the conviction had developed that constructive work comes into natural relations with the worker only when he contributes something of his own thought to attain the end placed before him. Out of this attitude, aided by a deeper study of the thought of such educational leaders as Froebel, Pestalozzi, and Herbart, and clarified by the emphasis of the psychologists on the unity of the mental processes, has developed the conception of manual training as a means of expression, a means of expression in terms of form, color, materials, muscular activity, and concrete

ends, a means of expression peculiarly adapted to child life.

During the last seven or eight years, the growing emphasis placed upon the social meaning of education has caused attention to be turned more and more to the subject matter or content side of manual training, and the conception of manual training, at least in the elementary school, has come more and more to be that of an educational instrument interpreting the fields of art and industry in terms adapted to child life and the limitations of the school.

All of this development in the philosophy of manual training has tended away from the employment of self-contained, formal courses towards the use of handwork as a medium of social experiences leading to the acquisition of knowledge. One of the most complete expressions of this idea is the employment of constructive activities in the lower grades in the form of social occupations, which serve as centers for instruction in other branches. This type of work was developed to a notable extent in the University Elementary School conducted by Professor John Dewey from 1896 to 1905 in connection with the University of Chicago.

Vocational Education and Manual Training.—With the attention given to industrial education in the United States of late years, manual training has undoubtedly lost something of its importance in the public mind. It is probable, however, that this attitude is only temporary, for all thoughtful consideration agrees that manual training in elementary schools constitutes an invaluable basis, and, under the peculiarly unsettling influences of American life, a most necessary foundation for an effective system of industrial education. On the other hand, it seems probable, from many experiments now being conducted, that a semi-vocational or a pre-vocational type of manual training is likely to assume importance in large cities, which will afford to boys and girls compelled to leave school at the compulsory age limit, an elective opportunity for one or two years before that time to acquire some measure of industrial intelligence and to learn from a number of industrial experiences the general field for which they may be best fitted. MANUAL TRAINING, HYGIENE OF.—

Manual training when given under proper conditions is an occupation distinctly favorable to health. It is important, however, that certain hygienic rules should be observed. First of all are certain obvious matters. The room should be large, well lighted, and well ventilated; or, better still, when conditions permit, the work should be out of doors. There should be suitable benches, ample in size, and adjusted in height to the pupil's work. Cleanliness in the room, the work, and the pupils should be rigorously demanded. The pupils should not work for long periods without change and recreation. Fine and delicate work, like certain forms of woodcarving, where there is a confusion of lines, should be omitted, at least in the earlier grades. As a rule exercises should be chosen which can be done standing, and the pupils should be taught to take a correct posture. Frequent change of position is desirable. Exercises which permit many movements of the body are preferable to those that require only a few; and exercises which especially hinder the circulation and retard breathing should be avoided. The muscles on both sides of the body should be exercised. Pupils should be taught not to press the tools against the body. Dust, poisonous colors, and the like, should be avoided.

Woodwork at the carpenter's bench is one of the most healthful kinds of manual exercise. It permits many movements, different postures of the body, and fosters all-round development. The lighter forms of woodwork are especially good for younger children. Woodcarving has its disadvantages on account of the fine work often required and the tendency to a bad posture. Scroll work is unhygienic, because the position of the body is likely to be bad, fine sawdust is often inhaled, and the strain on the eye is considerable. Tooled leather work, cut leather work, and the like, are also in many respects bad.

In all forms of manual training the hygiene of the eye should be considered. There should

always be sufficient light, at least ten-meter candles at each desk on the darkest days, and the work so arranged that no pupils will face the source of light. The hours for work may well be in the early afternoon. In the case of the finer work, especially for girls, the instruction should be omitted in dull weather when the light is insufficient.

Manual work for girls deserves special consideration from the hygienic point of view. The work must not be too fine and difficult, it should be kept at a proper distance from the eyes, and a proper posture should be maintained. The rules given by Cohn and Weber may be taken as norms. "I have classified hand-occupations," says Cohn, "in four divisions, according as the degree of fineness of the meshes and stitches lets the work be seen with greater or less difficulty, or not at all, at a distance of one foot. All those coarse kinds of work in which the meshes and stitches can be clearly distinguished at arm's length by a healthy eye are not injurious. Such are knitting, crocheting with wool, netting, coarse darning, and ordinary making of garments. The second kind of work has to do with meshes and stitches which a healthy eye can only see with a great effort at a distance of one foot and at an angle of one minute. To this class belong fine darning, appliqué of muslin on net for curtains, embroidery in colors, the old German Holbein embroidery (so called), mignardise crochet, and the favorite filet-guipure. The third class includes fine white needlework, English and French embroidery, button-holing, satin-stitch, and marking. This kind of work, by its greater minuteness, leads very frequently to myopia or asthenopia. The fourth class, that of superlatively fine needlework—point lace, petit-points, fine pearl embroidery, and genuine lace work—is absolutely injurious. There is, moreover, a special reason for avoiding satin-stitch in schools; namely, that this work is stretched on a frame, which cannot be brought near the eye like the other kinds of work, but the eye has to be brought near to it."

In some of the occupations for girls care should be taken to avoid strain of vision on account of the colors used. Black on black or white on white cause strain because of lack of contrast. On fine work the pupils should work for but a short period, ten minutes or so continuously, and then the eye should be relieved by a short pause and exercises in looking at objects at a distance. According to Cohn manual work should never be done by artificial light unless it be the electric light. Children with serious eye defects should be excluded from the work.

In regard to the question when manual training should begin, the answer is that it may be begun at an early age provided it is of the right kind. Kindergarten children, for example, can use a hammer in driving a nail, and it forms a healthful exercise; but they should not attempt

the finer and more complex occupations like fine weaving and sewing.

Certain general principles apply to manual training and to all forms of motor training. The exercises at first should involve the large muscles, and those requiring finer and more complex coordinations should come later. The work should be given in right sequence, that in the earlier years being propaedeutic to what comes at a later period. And it is important from the point of view of hygiene as well as pedagogy that there should be individualization, adaptation to the physiological and psychological age, or the stage of development, and an appeal to the interests of children. Manual training is often especially valuable for those children who are in some way defective. Not only are the defects likely to be discovered in the manual work, but this often furnishes a wholesome form of activity that is prophylactic against disease. Psychiatrists often use various forms of manual work, especially agriculture, as a means of cure in nervous breakdown; such exercises are perhaps equally important for the prevention of nervous disease.

The deeper meaning of manual training, as of all forms of motor training, is not without importance for hygiene. It is only by exercise of the peripheral organs that proper stimulation is furnished for the development of the brain. Even consciousness itself is apparently conditioned by stimulation from the peripheral sense organs. It is noteworthy that the nervous system is developed in the embryo from the epiblast, the outside germ layer, not from the meso-blast, and then it is folded in. Thus, genetically, the nervous system is developed by contact with the external world, and its later and higher developments are dependent upon peripheral stimulation. The importance of this is shown in large letters in the training of defectives, as in the classic case of Seguin's boy, where an idiotic hand, incapable of coordinated movements and control, by systematic exercises beginning with the larger muscles of the shoulder and arm, was educated in a year or two so that it could execute such highly coordinated acts as catching a ball, buttoning a coat, and the like.

Thus the brain and the nervous system are conditioned in their development by motor exercise, and manual training represents in an important way a group of habits that are among the alphabets of health. Again, the habits of attention, accuracy, self-reliance, and self-control that are fostered by manual training are of vital significance in mental hygiene. And, finally, manual training furnishes opportunity for the development of normal reactions toward others, emphasizing important social relations; and this work is allied with the positive, creative, productive, and coöperative activities that are of vital significance in social hygiene.

MANUALS, TEACHERS'. — The term "manual" originally meant an abridgment of a subject. It was so used by the Greeks (*Enchiridion*); and this use of the term is rather general to-day. In France, since the period of the Revolution, and in our own country, since about 1830, the term has had special educational significance, in that it has been made to cover only such helps as were of special value to teachers in the development of subjects of study. Such manuals, however, were prepared as early as the time of Comenius (*q.v.*). During the six years (1612-1648) that he was in the service of the Swedish government, the great Moravian educator prepared a large number of manuals on ancient and modern languages, morals, science, and the arts for the use of Swedish schoolmasters. Soon after the French Revolution, manuals as helps to teachers in moral and physical sciences were published in France. The great educational movement of the first quarter of the nineteenth century in the United States gave birth to numerous teachers' manuals. The earliest American manuals, dating from the year 1830, pertain to subjects not previously taught in the schools, such as physiology, music, and calisthenics. Somewhat later the introduction of drawing in the schools led to the publication of numerous manuals on art instruction. With the spread of the Oswego movement (*q.v.*), a demand was created for manuals on common objects. The Grube method, the phonetic method, and scores of other specific methods of giving instruction in definite branches of study have likewise contributed to the literature of teachers' manuals in the United States. *The Instructor's Manual*, published by Samuel R. Hall, in 1852, covers the entire field of education. Many of the

recent teachers' manuals have aimed to give definite suggestions for carrying out the course of study. Such is the aim of the three volumes published by James MacAllister in Philadelphia in 1887 (*Manuals of the Graded Course of Instruction in the Philadelphia Public Schools*). More recently the term has been used to cover the helps prepared by authors of textbooks in the use of their particular books, as Zucht-mann's *Teachers' Manual of the American Music System* (1893) and Frye's *Teachers' Manual of Geography*. MANY-SIDED INTEREST. — In the article on Interest (*q.v.*) it is noted that the term "interest" is used in an objective sense to denote the typically important concerns of life — science, politics, religion, art, etc. Herbart defined the aim of education as the development of many-sided interest — that is, of regard for all of these significant human values. The term "interest" obviously designates the active and alert identification of the self with these concerns; the term "many-sided" denotes the need of non-one-sided susceptibility. The notion was the counterpart, from the realistic side, of the current idealistic conception of complete and harmonious development of all the individual's powers or faculties as the aim of education. J. D.

MAP or MAPES, WALTER (fl. 1200) — English ecclesiastic, author, and satirist. He was born on the border of Wales, probably in Herefordshire, of a noble family. He studied at Paris between 1150 and 1160 for he mentions Girard la Pucelle as one of his teachers. By 1162 he was back at the English court, where he acted as secretary and itinerant justice. He traveled frequently with and on behalf of the King, Henry II, and attended the Lateran Council. In 1176 he became canon of St. Paul's and precentor of Lincoln. After 1196, when he was archdeacon of Oxford, nothing more is heard of him. Map was for long definitely known as the author of *De Nugis Curialium*, a gossiping and witty account of the life of the times as seen by a member of the court.

A number of poems attributed to Bishop Goliath indicating the excesses and licentiousness of monks and ecclesiastics are now thought to have been written by Map. In addition to many shorter poems, the most famous in this series are the *Apocalypse of Goliath* and the *Confession of Goliath*. From the latter of these are drawn, not from the same context, the lines of the famous drinking song: —

Meum est propositum in taberna mori.
Vinum sit appositum morientis ori.
Ut deant cum venerint angelorum chori
"Deus sit propitius huic potatori."

While there are certain difficulties in the way of accepting Map as the author of all Goliardic poems and of the large number of Arthurian legends (*Lancelot of the Lake*, the *Quest of the Holy Grail*, and the *Death of Arthur*) attributed to him, all that can be said is that his name has been attached to them by long tradition. The poems and the *De Nugis* afford valuable first-hand evidence of the life and thought of the time from one who by his position and experience was able to draw an entertaining picture.

MAPS, CHARTS, GLOBES, AND ATLASES. — Of the several means which have been devised to represent the surface of the earth and indicate the form, size, and distribution

of geographic features, as well as the geographic distribution of a wide range of facts and phenomena, the map and chart are best known and most generally used. The distinction between map and chart based on common English usage is that the representation on a reduced scale and a flat surface of the whole or a part of the earth's surface is a *map*, while the representation under similar conditions of the facts and phenomena relating to the sea is a *chart*. As the surface of the earth is nearly spherical, a sphere or a section of a sphere furnishes a much more accurate ground for the construction of maps than a flat surface, but the difficulty of handling and housing large globes greatly limits their use. A globe three feet in diameter is very unusual, the majority being eighteen inches or less. When maps of different parts of the earth's surface are gathered together in a single volume, it is called an *atlas*. As the maps must be printed on pages of the same size, and as the areas represented differ greatly in size, they are necessarily drawn to different scales. The common type of atlas is one in which the maps are for the greater part political in character. Other types of atlases will be mentioned later.

Maps. — The use of maps among civilized people is almost universal. Every schoolboy who has studied his geography knows something about them, and travelers, students, and the general public turn to them instinctively when in need of certain kinds of information. They are of such value in engineering and com-

merce and in such general use for scientific, military, political, and educational purposes that it is rather remarkable that they are so little understood or appreciated. They make use of a symbolism which in late years has developed to the proportions of a language. To the trained explorer, engineer, and navigator this language is as easily read as a printed page and conveys even more exact ideas. For the majority of users, however, maps are consulted because they show approximately the form of natural and political divisions, furnish a means of tracing routes of exploration, travel, and trade, and show the location of places in reference to each other. The layman usually lacks the ability to read maps and knows no hint of the great variety of facts shown or of the scientific accuracy of their presentation.

Classification of Maps. — A classification of maps may be made according to (1) the area represented, (2) the facts shown, (3) the scale employed, and (4) the purpose for which they are to be used. In area represented, distinction is generally made between (a) the earth as a whole, shown on a "world map," which pictures the entire surface of the earth in a single map; or on a "hemisphere map," which shows the surface in two hemispheres; and (b) parts of the earth, as shown on a "general map" for a continent or large political division, or a "map sheet" of a topographic or similar survey.

Facts Shown. — Classified according to the facts shown, there are: (1) *Political maps*, which show primarily the location of settlements and the division of continents into countries, and countries into smaller political and administrative divisions. The map base upon which such facts are represented generally shows certain physical facts as well, especially the natural boundaries and the chief drainage lines. (2) *Physical maps*, which may show the physical features and conditions of a given region in detail, or the distribution over the whole or a part of the earth of certain physical facts or phenomena such as the average rainfall or the location of the ocean currents. (3) *Industrial and Commercial maps*, which show such facts as the distribution of population according to density, the distribution of industries in which the people are engaged, the location of important commercial and trade routes, the position of commercial and industrial cities, and trunk lines of communication. (4) *Geological maps*, constructed to show the rock formation underlying the surface covering of the earth, the geologic age to which they belong, or their economic importance. (5) *Ethnological maps*, to show the distribution of people according to race, religion, color, speech, or custom. (6) *Historical Maps*, in great variety, used to show the conditions as they were in some part of the world at some previous time in the world's history, or used in a series to show how conditions have changed

or developed from time to time during the lapse of years.

Scale.—In considering the classification of maps according to scale, it must be borne in mind that, based upon the system of linear measurement in use, a decimal system may be adopted, as among the French and German map makers, or a more arbitrary scale such as is frequently used by British and American map makers. Under this classification, there are:—

(1) Maps on a scale from 1: 500 to 1: 10,000, usually referred to as plain or detail maps. Included in this group are the maps prepared by engineers having in charge the construction of canals, railways, systems of irrigation, and the plans of cities and villages. Most objects may be shown in their correct form and true to scale.

(2) Maps on a scale from 1: 10,000 to 1: 150,000. The most important maps in this group are the topographic maps which are now being made, or which have already been made by practically all of the great governments of the world. These maps are necessarily drawn and printed in sheets of convenient size for handling, the number of sheets running into hundreds for small countries and thousands for large countries. In the European countries especially they are regarded as of the utmost importance for the war departments, and for that reason in many countries their execution has been intrusted to such a department. In other countries, special bureaus or departments are maintained for the work. These maps have also been found of importance to agriculture and commerce, in works of internal improvement, for recording geological researches or the classification of soils, and in many other ways. On them it is usually possible to show many objects true to scale, although others, such as rivers, and roads, are necessarily very much exaggerated.

The sheets of the topographic map of the United States are published in three scales: (1) 1: 62,500, which is approximately one mile to one inch, used for densely settled and industrially important parts of the country. (2) An intermediate scale of 1: 125,000 used for the greater part of the country. (3) 1: 250,000, or about four miles to one inch used for the desert regions of the west. The sheets on the largest scale show an area of fifteen minutes of longitude by fifteen minutes of latitude; the intermediate scale thirty minutes by thirty minutes, and the smallest scale one degree by one degree. The execution of the work is by the Geological Survey of the Department of the Interior. The topographic map of the United Kingdom on a scale of one inch to a mile was completed in 1890, and consists of 697 sheets (488 of the new series). It is published (a) in outline with contours in black, (b) with vertical hachures

in brown or black, and (c) in five colors. The topographic map of the German Empire is on a scale of 1: 100,000. It was completed in 1909 in 674 sheets. The sheets issued since 1901 have been printed in color.

There are several excellent topographic maps of France in existence, one on a scale of 1: 80,000, another on a scale of 1: 1,000,000, and a third on a scale of 1: 200,000; the last two are based on the first. Still another is in preparation on a scale of 1: 50,000. Each sheet is bounded by parallels and meridians, and their relief is shown in contours of ten-meter intervals printed in brown.

(3) Maps on a scale from 1: 15,000 to 1: 1,000,000 and smaller. These include the general maps of continents and countries and their larger divisions. In maps drawn on these smaller scales it is impossible to show all geographic features or to show even the selected ones in their correct form. The first difficulty is avoided through the careful selection of facts to be shown, and the second by the use of symbols.

Use.—In any classification according to use, the school map must be distinguished from all others. Whether in the form of a wall, text, or atlas map, it includes but few details and is usually designed to furnish clear and definite information concerning features and places discussed in the school textbooks.

Collecting the Data.—Before the preparation of a map can be undertaken, it is necessary to assemble the facts which are to be shown when it is completed. First of all, it is necessary to know the position, form, and dimensions of all the objects which are to be represented. The position of a point on the earth's surface is usually stated in terms of its latitude and longitude. Its latitude is its distance north or south of the equator, — the equator being the zero of latitude, — and its longitude is its distance east or west of a selected prime or zero meridian. There is, therefore, a north or south latitude and an east and west longitude. Each circle is divided into 360 degrees, each degree into sixty minutes, and each minute into sixty seconds. The poles of the earth are in latitude ninety degrees, while the meridian, halfway around the earth, from the prime meridian, is both 180 degrees east and 180 degrees west longitude. The division of the circle into 360 degrees was introduced among the Greeks chiefly by Hipparchus (about 180–125 B.C.), and to him also has been given the credit of originating the idea of fixing the position of places on the earth by means of their latitude and longitude. As the position of certain points on the earth's surface has been determined by astronomical means with great exactness, the position of other points and objects are usually determined with reference to these. It is quite as important, although less customary, to indicate the third element of position, viz. the height of a place

MAPS

above, or its depth below, an ideal plane of reference, called sea level. This is usually mean tidal height as determined at some selected station from a series of observations extending over a long period of time.

Projections. — When the necessary data has been collected, the map is drawn. As already

FIG. A.—The left-hand half of the above figure shows the orthographic polar projection. The half circle is divided into ten-degree arcs, *LA-AB-BC* and *Ga-ab-bc-etc.* As the eye in the projection is assumed to be at an infinite distance, these points are projected upon the line *PN* at the points numbered 8, 7, 6, 5, etc., by parallel lines drawn at right angles to *PN*. The parallels are drawn as concentric circles passing through the points thus determined, and the meridians are drawn as straight lines from the circumference to the pole at ten-degree intervals. The right-hand half of the figure shows the stereographic polar projection. The half circle is again divided into ten-degree arcs. The eye is assumed to be at *G*. Points *a, b, c, d, etc.*, are projected upon line *PM* at 8, 7, 6, 5, etc. The parallels are drawn as concentric circles passing through these points and the meridians as straight lines from the circumference to the pole and at ten-degree intervals. The two shaded spots *I, 2, 3, 4* and *I', I'', I''', I''''* represent the projection of exactly the same part of a sphere and show how and where this part would appear in the two projections.

pointed out, this can be done with the greatest accuracy on the surface of a sphere. The equator, poles and prime meridian are first located, and the surface of the sphere is then covered with a network of parallels and meridians. By means of this net, the outlines of continents and islands, the boundaries of states and nations, and the form and position of geographic features may be correctly shown. A representation of any part of the earth's surface must therefore, if kept true to scale, be developed upon a sphere or a part of a sphere. In practice, however, this is utterly impossible. The uses to which maps are put make it necessary that they should be on some flat surface, such as paper or cloth, in order

MAPS

that they may be rolled, folded, or bound together, and carried about easily.

The network of parallels and meridians is, however, as necessary for the flat map as it is for the globe. It is of course possible to make use of a perfectly arbitrary net, such as is made by equally spaced lines crossing each other at right angles. Maps constructed on this projection are known as *plain maps* (or *charts*) and were originated by Marinus of Tyre, who lived about 100 A.D. He is regarded as the founder of mathematical geography. Many forms of projection have been devised, as mathematicians and astronomers have, since ancient times, sought to make the unavoidable errors as small as possible, and to devise forms of projection adapted for special uses. Five forms of projection, or modifications of them, are in very common use. These are the *orthographic*, the *stereographic*, the *globular*, the *conical*, and *Mercator's*. Briefly, the characteristics of these projections are: (1) *Orthographic*. In this projection the circles of the sphere are supposed

FIG. B.—The left-hand half of this figure shows the orthographic equatorial projection. The crowding of parallels and meridians toward the outer edge is characteristic of this projection. After the distance between the parallels has been determined (as shown in Fig. A) they are drawn as straight lines, as the eye is at an infinite distance and on a level with all planes. The spaces between the meridians on the equator are determined in the same way, and the meridians are frequently drawn as the arcs of circles, although other methods of drawing them are also in use.

The right-hand half of the figure shows the stereographic equatorial projection. In this the meridians and parallels are crowded near the center.

to be seen by an eye placed at an infinite distance and projected upon a plane which passes through the center of the sphere and perpendicular to the line of sight. The meridians and parallels are crowded toward the outer edge of the map. (2) *Stereographic*. By this

MAPS

method the center of projection is in the surface of the sphere, while the projection is made upon a plane at a right angle to the diameter which passes through the center of the projec-

FIG. C.—The globular equatorial projection shown above is developed from the smaller circle whose center is at B on the line 90-90 drawn tangent to the smaller circle at O. This tangent line becomes the polar diameter of the larger circle, and to determine the 10-degree intervals on this diameter the following method is used: The equatorial diameter of the smaller circle is prolonged beyond its circumference to A, a distance equal to the line CD, which is one half the chord of a 90° arc. From A through 90°-80°-70°-etc., marking off 10-degree intervals on the circumference of the smaller circle, lines are drawn which intersect the polar diameter of the larger circle at 90°-80°-70°-etc. These measurements are then transferred to the equatorial diameter, and in this way three points are located for each parallel and meridian. As both parallels and meridians are arcs of circles, it only remains to find the centers of these circles by the usual methods and to complete the projection. The 10-degree intervals found by this method are approximately equal, and the projection is often constructed arbitrarily and called the arbitrary projection.

tion. In this projection the meridians and parallels are crowded toward the center of the map. (3) *Globular*. A form of projection in which the surface of a hemisphere is projected

FIG. D.—This shows the globular polar projection. The 10-degree intervals are determined as for Fig. C above. The parallels are concentric circles, and the meridians are drawn as straight lines from the circumference to the pole.

upon a plane which is parallel to the base of the hemisphere. The center of projection is in

MAPS

the axis produced beyond the surface of the other hemisphere, a distance equal to one half the chord of a ninety-degree arc. This projection was designed to overcome the crowding of the parallels and meridians shown in the orthographic near the edge, and in the stereographic near the center. As a result, the parallels and meridians are about equally spaced, and the map

FIG. E.—In this diagram the forty-fifth parallel has been selected as the center of the area to be mapped, and the cone is tangent to the surface of the sphere at that parallel. The position of the other parallels being determined, they are drawn as concentric circles with the pole as a center. The meridians are straight lines radiating from the pole and at equal distances on any parallel.

is often arbitrarily drawn in that way. (4) *Conical*. In this projection the surface of the sphere is projected upon the surface of a cone tangent to the sphere. The point of sight is at the center of the sphere. (5) *Mercator's*. This form of projection shows the meridians as parallel to each other, and the parallels as straight lines crossing the meridians at right angles. It has many variations but in the best the meridians and parallels are so spaced that, at all

FIG. F — Conic Projection of the World.

places, the degrees of latitude and longitude have the same ratio to each other as on the sphere.

Filling In.—After the net of parallels and meridians has been drawn, it is a comparatively easy matter to fill in the outlines of countries, including the coast line, rivers, roads, and railroads, and to indicate the positions of cities and villages. In the nature of things maps will often fail to show all the facts of nature. No map can show all of the irregularities of a coast line or all the windings of a river, and the smaller the scale of the map,

MAPS

the more these and other facts must be generalized. On some coasts tidal changes affect the position of the actual coast line, from hour to hour, and the best that can be done is to show on large-scale maps the extent of land alternately covered and exposed. On the smaller

FIG. G.—In this modified form of Mercator's projection the distances between the parallels which are here drawn at fifteen-degree intervals are determined by dropping a line perpendicular to OF and parallel to $A'L$ from the end of each radius to the next radius. $AK = A'K'$, $BN = B'N'$, $CP = C'P'$, etc. The meridians are parallel and equidistant, their distance apart being the same as that between the equator and the first parallel.

scale maps even the dots and other symbols used to indicate the position of cities cover much too great an area, as do also the lines for the rivers and the roads.

Methods of showing Relief.—It was not until toward the close of the eighteenth cen-

FIG. H.—Mercator's Projection.

tury that scientific methods were developed for showing accurately the surface features of the earth. Up to that time, map makers had been content to indicate the position and general direction of the large or important elevations by means of molehills and serrated ridges, which gave little idea as to their extent and none as to their form and the steepness of their slopes. Two methods are now in general use which may be said to satisfy

MAPS

scientific requirements. One of these is by the use of contours, and the other is by the use of hachures. In the contour maps each contour passes through points at the same distance above sea level. If the area to be mapped includes a bit of seacoast, the coast line itself may be taken as the first contour and the zero of elevation. The remaining contours will then be drawn at such intervals as to show clearly the character of the relief. A contour which is ten feet above sea level is drawn where the coast line would be if the land was depressed by that amount. Whatever the interval chosen, the contours are farther apart on gentle than on steep slopes, although crowded contours drawn at an interval of ten feet may indicate a much gentler slope than more widely spaced contours drawn at much greater intervals. Contours are used on the topographic sheets now being issued

FIG. I.—The sketch shows a river valley with terraces and a high hill and steep cliffs. The map shows how these features are expressed by the use of contours.

by the Geological Survey of the United States government. The way in which contours show relief is well brought out in the ideal sketch and corresponding contour map (Fig. I) which is used by the Survey to explain their meaning. Contours were first used in 1728 by M. S. Cruquius in his chart of the Merwede.

While contoured maps show the height of the land and furnish sufficient data to determine in a general way the steepness of mountain slopes, they fail to show the modeling of the earth's surface as clearly as do hachures. This method makes use of lines which vary in thickness and in distance apart according to the steepness of the slope represented. They are drawn in the direction which would be taken by flowing water, and

when contour lines are used on the same map, they cross the contours at right angles. The method was first given scientific form by Major J. G. Lehmann, although proposed at a somewhat earlier date by Ludwig Müller. The scheme as outlined by Lehmann assumed vertical illumination and a consequent variation in the amount of shade from nothing for a horizontal surface, to absolute darkness for a vertical surface. He suggested, however, that its use be limited to regions in which the slopes did not exceed forty-five degrees, assuming that steeper slopes would be, in a military sense, practically impassable. This

FIG. J.—This figure shows the three hachure systems described in the text. The Austrian method represents the highest development of this method of showing relief.

resulted in white for horizontal surfaces, black for slopes of forty-five degrees, and for intermediate slopes at five-degree intervals, a proportion of white and black determined by the formula $W : B = (45 - n) : n$ in which n represents the slope for which the proportion is sought. If the slope is twenty degrees, the proportion will work out

$$W : B = (45 - 20) : 20 = 25 : 20 = 5 : 4.$$

The full scale is shown in Fig. J, with the proportion of black and white indicated for each interval. The system has had very wide application, and changes have been made from time to time in various countries, either for the purposes of securing greater

clearness, as in the Müffling system, which uses dotted and wavy lines and alternating thick and thin lines for this purpose, or to provide for steeper slopes, as in the Austrian system, which reserves solid black for slopes of eighty degrees. In large general maps upon which contours are drawn at considerable and frequently irregular intervals, the strata are usually shown by several colors or by tints and shades of one color. In the map of the world on a scale of 1 : 1,000,000 proposed by Professor Penck and now under construction by several governments the colors to be used are blue for the sea, green for lowlands to 300 meters, yellow between 300 and 500 meters, and reddish tints for greater elevations. The use of the mezzotint shading instead of the line shading is sometimes resorted to, and in contour maps the results are often excellent. Maps shaded upon the assumption of an obliquely lighted surface are often very artistic in appearance, but they lose in scientific accuracy.

All maps employ some symbols, and the details shown in the topographic surveys have led to the use of a very considerable number. The facts shown on the topographic sheets of the United States may be divided into three classes: (1) relief, printed in brown; (2) drainage, printed in blue; and (3) culture, printed in black. The full-page illustration shows the symbols used on these maps.

In the placing of names on a map there is no uniformity of practice, but in the matter of orthography uniformity is being rapidly introduced through governmental and other boards on the spelling of geographical names.

Relief Maps.—Many attempts have been made to make relief maps, chiefly for school use. It has been urged with reason that by their use the children may be given more accurate notions concerning the surface of the earth and the effect of relief upon climate, the distribution of life, the location of settlements, and the development of routes of trade and communication. The best relief maps are those which are constructed on a large enough scale to permit the showing of elevation true to scale. This cannot be done, however, on small-scale maps. In these the heights are greatly exaggerated, the slopes absurdly steep, and the generalization of the surface features very considerable, but even these when properly constructed are undoubtedly valuable, although it may be questioned whether children gain much of value when they attempt to make crude maps of this sort out of sand, clay, putty, papier-mâché, etc.

Printing.—After the map has been drawn, it still remains to be printed. In the early days this was done from wood blocks or from copper plates on which the map had been engraved. Wood engraving for maps was abandoned many years ago, but copper engraving, especially when combined with etch-

ing, is still in use. Other quicker and cheaper processes have been discovered such as lithography, zincography, algraphy, and heliography, and these give very satisfactory results.

Charts. — The surface of the earth measures approximately 196,940,000 square miles, of which 145,054,000, or nearly three fourths, is sea. Over much of this vast surface ships carry goods and passengers. Some of them are tramps, trading from port to port as contracts offer, but for the most part they follow well-defined routes and enter and leave their regular ports at stated intervals. It is of the greatest importance that they should be able to do this without undue danger or delay, and, to make this possible, every maritime nation has made or is making extensive and accurate surveys of its coasts and harbors. In some instances, notably in the case of Great Britain, colonial interests have led nations to extend their surveys to the coasts and harbors of other countries whose governments are less able to undertake them or less interested in so doing. In spite of all that has been done, there are long stretches of coast and large ocean areas which have never been accurately surveyed and charted.

Charts are essentially maps for the use of navigators. As such they must include depth curves and characteristic soundings, show the nature of the bottom, and indicate the position of buoys, lighthouses, and other aids to navigation, as well as the position of the coast line at high and low water. Currents are shown by arrows and described in notes, as is also the range of tides. On the large-scale charts channel lines and ranges are given, and life-saving stations, ports showing storm warnings and time balls, are indicated. Forbidden anchorages are also shown. Most charts show enough of the coast to indicate its character and mark clearly every prominent feature or fact of interest to the navigator, especially if it may serve him as a landmark.

Collecting the Data. — As in the construction of a map, so with the chart, the first step is the collection of the data to be shown on the completed chart. The position of the area to be charted is obtained by astronomical observations and by reference to points whose positions have already been determined and a net of parallels and meridians is then drawn. Such topographical features as are deemed important are next located. These always include high and low water lines, offshore rocks, lighthouses, and streams of all sizes, and usually include many other features of importance. The survey of the sea bottom is especially important, as it is only by this means that sunken rocks, reefs, shoals, sand bars, and other dangers may be located. This work is done by sounding. The soundings are made in a series of lines, from a boat whose position is accurately determined at short intervals, over the entire area to be charted. In shall-

low water the soundings may be taken by hand by casting the lead overboard and noting the depth indicated when the lead reaches the bottom and the line is vertical. For greater depths machines are used. At best this method of determining the configuration of the sea bottom is unsatisfactory, as there exists no means of ascertaining depths between soundings. Near the shore and in harbors and about their entrances soundings are therefore close together. After all of the soundings have been compiled, the characteristic ones are selected and plotted on the original sheet, the depth curves are drawn, and shoals, bars, anchorages, and channel depths located. In harbors in which sediment is being constantly deposited and wherever the sand bars are being shifted by the action of waves and ocean currents, new soundings must be frequently taken and the charts corrected. The constant increase in the size of vessels making use of harbors make frequent surveys necessary. Usually, however, surveys are made only at considerable intervals, but changes and corrections are being made constantly as new dangers are discovered and as changes are made in buoys and lights.

Scale. — Harbor and channel charts are published on scales varying from 1:5000 to 1:60,000, coast charts on a scale of 1:80,000, general coast charts on a scale of 1:400,000, and general sailing charts on a scale of 1:1,200,000.

Projections. — The Mercator projection is used for nearly all general sailing charts. Its characteristics have already been briefly stated. The three other projections chiefly used in the construction of charts are the polyconic, gnomonic, and globular. The polyconic is similar to the conic already described, except that instead of a single tangent cone several are used, each parallel being the base of a right cone which is tangent to the sphere along that parallel. The radii increase in length as the distance from the pole increases, and the parallels are therefore not the arcs of concentric circles and are not strictly parallel. The division of each parallel into degrees of longitude is correct, and the meridians are therefore more and more curved as the distance from the central meridian increases. The latitude scale is correct on the central meridian only. In the gnomonic projection the eye is at the center of the earth, and the projection is upon a plane tangent to the earth's surface. The globular projection has already been described.

Globes. — The advantages and disadvantages of maps and charts drawn on the surface of a sphere have already been pointed out. They are of the utmost importance in geographical instruction, as it is only by their use that children gain correct ideas as to the form, size, and position of the great land and water bodies and their chief divisions.

The Manufacture of Globes.—In the manufacture of globes a core or matrix is first covered with many layers of paper pasted together; this covering is then cut apart, the core removed, and the two hemispheres at once joined together along the line of the equator. The sphere is then mounted on an axis and coated with whiting, which is smoothed and allowed to harden. The paper gores upon which the map has already been printed are then mounted with the greatest care so as to adapt them to the surface of the sphere. The number of gores used varies from twelve to twenty-four. Nearly all globes are mounted upon standards in such a way that the axis is inclined approximately 23½ degrees out of the perpendicular.

Atlases.—The practice of showing the geographical distribution of all sorts of facts and phenomena has become very common in recent years and has resulted in the publication of many special atlases of which the following are characteristic: (1) atlas of geology; (2) atlas of hydrography; (3) atlas of meteorology; (4) atlas of commerce and statistics; (5) atlas of plant distribution; (6) colonial atlas; (7) school atlases of various sorts; (8) and historical atlases. In each type special methods and symbols have been developed in order to show the facts as clearly, accurately, and completely as possible.

For the place of the subject in the study of geography and the general question of teaching method, see GEOGRAPHY, TEACHING OF, and the references there given. C. T. Mc. F.

MARBLE, ALBERT PRESCOTT (1836–1906).—School superintendent. He was educated at Bowdoin College and Colby University, graduating at the latter institution in 1861. He taught in the public schools of Maine and Wisconsin; was principal of the Worcester Academy (1866–1868); superintendent of schools at Worcester (1868–1894) and at Omaha (1894–1896); and from 1896 until his death

he was assistant superintendent of schools in New York City. He was active in the councils of the National Education Association and the Massachusetts Teachers' Association. His publications include *Sanitary Condition of School Houses* and numerous articles in educational journals. W. S. M.

MARBURG, ROYAL PRUSSIAN UNIVERSITY OF, GERMANY.—The first Protestant University in Germany, established in 1527 by Philip of Hesse as a center for the propagation and support of Lutheranism. A Pädagogium or preparatory school was established at the same time. Imperial recognition was not obtained until 1541, but degrees were granted before that date, the privilege being granted by a local ruler for the first time. Among the early humanistic teachers were Buschius, Eobanus Hessus, and Schuppianus. The university was well attended, and in 1600 there were about 1000 students. The introduction of Calvinism in 1608 by the Landgrave Maurice drove many teachers and students away, and for them the Landgrave of Hesse-Darmstadt founded the University of Giessen (*qv*). The two universities were combined in 1625 at Marburg, but only for a few years. The Thirty Years' War almost led to the extinction of the university, which was recreated in 1753 as the University of Hesse-Cassel. It was for a long time strongly denominational under the Reformed Church, an exception being made only for Christian Wolf (1723–1740). This attitude tended to disappear during the period of Enlightenment, and even the theological faculty admitted Lutherans by 1821. The university, however, at no time during this period attained great standing; the medical-scientific faculty was weakened by the development of the Collegium Carolinum at Cassel, transferred to Marburg in 1786. A few chairs were added at the end of the eighteenth century, but the endowment was still small until under the Kingdom of Westphalia (1806–1813) the funds of the institutions at Rinteln and Helmstedt were transferred to Marburg. In the middle of the last century the university suffered largely through political complications, and progress was so slow that for a time a proposal was in the air to amalgamate again with Giessen. The union of Hesse with Prussia in 1866 marked the beginning of a new era in the history of the university. The government treated the institution generously. The development of new chairs, seminars, institutes, and equipment has been very rapid. Special emphasis has been laid on the provision of facilities for the study of modern languages and philology. A strong summer school is maintained and is well attended by foreign students. The following faculties are maintained: theology, law, medicine, philosophy (philosophy, history, and natural science sections). The enrollment in the summer semester of 1912 was 2014 students.

MARCEL, CLAUDE (1793-1876).—Educationalist and French consul at Cork. From 1825 to 1865 he lived away from France, and thus came to take an interest in other languages and the teaching of them. His chief book was entitled: *Language as a Means of Mental Culture and International Communication; or Manual of the Teacher and Learner of Languages*, two volumes, London, 1853. Of this work Marcel published an abstract in French, *Premiers Principes d'Éducation avec leur Application Spéciale à l'Étude des Langues* (Paris, 1855). Marcel investigates thoroughly and comprehensively the whole field of education, and attempts thus to place language teaching in its true perspective. He treats of physical, moral, and intellectual education in his first book; of the signs of our ideas and importance of their acquisition in various languages in the second book; the three great agents of education (parents, teachers, methods) in the third book; the native tongue in the fourth book; order and relative importance of the different branches of a language, in the fifth book; of grammar, in the sixth book; then in successive books, of words; of reading; hearing; speaking; writing; and the time for learning a foreign language. He reduces his principles to twenty "logical" axioms. His methods were adapted to Italian by M. Jean Damiani, and to German and Latin by M. G. Théodore. The gist of Marcel's most valuable treatment of the teaching of modern languages is a recommendation of the direct or natural method. Marcel, in 1867, wrote a translation of part of his large book into French, under the title of *Étude des Langues ramenée à ses véritables Principes, ou l'Art de penser dans une Langue étrangère* (translated and published in New York, 1869) and a small pamphlet: *Méthode rationnelle suivant pas à pas la Marche de la Nature pour apprendre les Langues étrangères, avec ou sans Maître* (translated and published in New York, 1875).

MARCH, ANDREW FRANCIS (1825-1911).—Philologist and leader in the American movement for spelling reform (*q.v.*); graduated at Amherst College in 1845. He taught in the public schools for four years, and then took up the study of law. In 1856 he accepted the post of professor of English language and comparative philology at Lafayette College, which he occupied for forty years. He was one of the earliest advocates of simplified spelling in the United States, and was president of the Ameri-

can Spelling Reform Association from 1876 to 1905. He wrote numerous pamphlets on the subject. His other educational writings include *Method of Philological Study, Parser and Analyzer for Beginners, Comparative Grammar of the Anglo-Saxon Language, Anglo-Saxon Reader, The A B C Book*, and many articles on philological subjects. He was editor-in-chief of the *Standard Dictionary* and the American editor of the *Oxford Dictionary*. W. S. M.

MARCUS AURELIUS.—Roman Emperor from 161 to 180 A.D.,—a wise ruler, a brave general, a just and temperate man. His reign was marked by several great misfortunes: a plague, a famine, and successive inroads of the barbarians along the northern and eastern borders of the Empire. Though the barbarians were in the end successfully checked, they were a source of anxiety to the Emperor throughout his reign. The most serious impeachment of Marcus's good judgment was his persecution of the Christians.

The significance of Marcus Aurelius in the history of education lies in the fact that he established at Athens certain chairs of academic study with endowment from the imperial funds, and, by thus virtually creating what has been called the University of Athens, advanced the cause of education throughout the Empire. Certain steps had been taken by the previous Emperor, Antoninus Pius, looking toward the establishment of academic studies on a formal basis under the direction of the central government, but not before Marcus was anything like organization of the educational forces of Athens undertaken. Marcus was from his youth a friend and companion of Greek philosophers and at all times an admirer of Greek learning. Even after he became Emperor, he attended the lectures of the famous sophist, Herodes Atticus. In the second half of his reign he established at Athens, by the side of the chair of rhetoric, established in the reign of his predecessor, a second chair of greater dignity than the former. The higher salary which went with it was to be paid from the imperial funds, and the appointment to the chair was to be made by the Emperor. Later, probably in 176, he endowed at Athens two chairs in each of the four principal schools of philosophy—the Academic, the Peripatetic, the Stoic, and the Epicurean. The appointments to these chairs were to be made, after examination of the candidates, by Herodes Atticus. The holder of the chair of oratory ranked, at least in dignity, above the other professors. Marcus aimed to make of the city a real university center; as Dio Cassius says, "he gave to the whole world teachers at Athens, with

annual salaries, in every branch of literary study."

The *Meditations or Thoughts* (τὰ εἰς ἑαυτὸν) of Marcus Aurelius in twelve books are a collection of moral reflections and ethical maxims written in the spirit of the Stoic philosophy. The first section deals with his own education, and is a document of great value in revealing the character of Roman education under Stoic ideals.

MARENHOLTZ-BÜLOW—WENDHAUSEN, BERTHA VON (1810-1893).—The friend and admirer of Froebel (*q.v.*), who contributed more than any other person to make his work public. Of her early life it is not necessary to say anything here. She met Froebel in 1849, and at once appreciated the aims of the man who had been mentioned to her as "an old fool." She helped to introduce the unworldly teacher to others who could assist in bringing him into public notice. The chief among these was Diesterweg (*q.v.*). But her own efforts were considerable. Entering on her propaganda work in 1851, she did not relax her efforts until her death in 1893. In 1851 she lectured to a group of women in Berlin, explaining the *Mutter- und Koselieder*. With Diesterweg's help she founded a kindergarten at Pankow; but the period was unfavorable for any new educational ventures. In 1851 the establishment of kindergartens was forbidden in Prussia. After Froebel's death, which was a great blow to her, she devoted herself to the idea of founding an international Froebelian Society. She went to London in 1854, where she attracted attention. She lectured on Froebel and the kindergarten, and gave practical illustrations of this work in ragged schools (*q.v.*). Dickens noticed her in the *Household Words*; and an account appeared in the *Times* and *Athenaeum*. While in London she published *Women's Educational Missions, being an Explanation of Froebel's System of Infant Gardens*. In 1855 she went to Paris, where she did similar work, was noticed in the press, and wrote *Manuel des Jardins d'Enfants*. She carried her propaganda into Belgium and Switzerland. In 1861 she returned to Germany, and with the help of a women's society founded a kindergarten in Berlin (1863), the prohibition having been removed in 1860. Then she established, with the cooperation of Karl Schmidt, Professor Virchow, and others, *Erziehung der Gegenwart*, an educational magazine. In 1870 she settled in Dresden, where she founded the *Froebelstiftung* with a kindergarten, a training

college for kindergartners, and a home for kindergartners and governesses. In 1872 she succeeded in bringing into existence the *Allgemeine Erziehungsverein*. Her zeal for the work took her to Italy, where she aroused interest in the kindergarten in Florence, Rome, Naples, and Venice. Many of her works have been translated into English and include the following among others: *Die Arbeit und die neue Erziehung* (*Handwork and Headwork*), 1864; *The Child, Its Nature and Relations*, 1872; *The Child and Child Nature* (London, 1906); *The Kindergarten and the Importance of Children's Play*, 1882; *Reminiscences of Friedrich Froebel* (Boston, 1887); *Theoretisches und Praktisches Handbuch der Froebelschen Erziehungslehre* (Cassel, 1886-1887).

MARGARITA PHILOSOPHICA.—See ENCYCLOPEDIAS; ENCYCLOPÆDISM.

MARIA THERESA (1717-1780).—Queen of Hungary and Bohemia, archduchess of Austria, and wife of the Holy Roman Emperor, Francis I. Interested as Maria Theresa was in securing the welfare of her country, she devoted considerable attention to education, not only in her immediate dominions, but also in Belgium. During her reign the control of the clerical party was diminished, the Jesuits expelled, and a general system of education introduced under the control by a Board of Studies (*Studienhofkommission*), in which the secular power was uppermost. She gathered around her the most capable educators of the day, *e.g.* Felbiger (*q.v.*), Kindermann (*q.v.*), and Van Swieten. The new law was promulgated in 1774, and its introduction, "... we have observed that the education of both sexes, the basis of the real happiness of nations, requires our especial care," shows her deep concern for reform. She had also encouraged the first university lectures in Vienna on experimental physics (1745) and mechanics (1757). In 1749 she had founded a military school at Wiener-Neustadt, in which "shall be formed men only and of them soldiers. In Belgium she had also reorganized the secondary school system, after expelling the Jesuits. A board of studies was appointed, classics were edited, corporal punishment was abolished, and public examinations were introduced. To supply the need, new schools, Theresian Colleges, were added. The reorganization of schools of art, design, and architecture was also encouraged by her.

MARIETTA COLLEGE, MARIETTA, OHIO.

— A coeducational institution founded in 1830 as the Institute of Education, and chartered in 1832. A collegiate department only is maintained. The entrance requirements are fifteen units. The degrees of A.B. and A.M. are conferred. The total enrollment in 1911-1912 was 152. There is a teaching staff of eighteen members.

MARION, HENRI (1846-1896). — French educator who exercised a decisive influence on the real trend of educational methods in the University of France. He was active in the organization of secondary education for girls. He gave the first course of Educational Psychology and Morals at the Normal School of Fontenay-aux-Roses. The chair of Science of Education at the Sorbonne was established for him, and was occupied by him with great distinction until his death. Marion was the author of *Devoirs et Droits de l'Homme* (1879); *Leçons de Psychologie appliquée à l'Éducation* (1881); *Locke*, in the portrayal of whom he gives, according to M. Boutroux, a picture of himself; *La Solidarité morale*, in which he points out to what extent determinism, which leads to freedom, in realizing itself binds the individual to his own past by habit and to the racial past by heredity and education. *Mouvement des Idées pédagogiques en France* (1889); *Instructions sur la Discipline* (1890), which brought about a transformation of the discipline in French education by substituting order as willed by the pupils for order imposed from the outside; *L'Éducation dans l'Université* (1892); and, posthumous, *L'Éducation des jeunes Filles; la Psychologie de la Femme* (1900). Endowed with great charm, an excellent teacher, a man of good sense, a steadfast character, of fine and sensitive feeling, Marion exercised a decisive influence on several generations of teachers. His principle was that all means of the educative process ought to lead to the formation of a moral person (*moralisme*), and that national education well directed ought to improve the race and bring humanity to a better state (*méliorisme*).

MARTINEAU, JAMES (1805-1900). — English philosopher and divine, brother of Harriet Martineau, was educated at Manchester College, and became a Unitarian minister. He was for forty-five years professor of mental and

MARTINIQUE

moral philosophy at Manchester New College, London. He exerted a wide influence as a preacher, and won a high reputation as a writer on religion and philosophy. This was somewhat injured by his radical criticism of Spinoza and his idealistic theory of the Church, which was of an academic and impracticable character and fell still-born. In philosophy he was an intuitionist, holding that men have a power of conscience by which they can estimate moral values without the help of experience. His best work was done as a teacher of ethics and a defender of fundamental truths against the attacks of atheism, skepticism, materialism, and other negative tendencies in the nineteenth century. He wrote many volumes of sermons and essays for the periodical press. His chief works are the *Types of Ethical Theory*, the *Study of Religion*, and the *Seat of Authority in Religion*. These contain his best teaching in its final form.

MARTINIQUE.—See FRENCH COLONIES, EDUCATION IN.

MARWEDEL, EMMA (1817-1893). — Kindergarten. She was educated in the schools of Germany, and for six years was connected with the kindergarten training department of the Industrial Art School for Women at Hamburg (1865-1871). Through the efforts of Elizabeth P. Peabody (*qv*) she was induced to come to America and engage in the work of training kindergartners. She conducted training schools for kindergartners at Washington from 1872 to 1876, and at Los Angeles and San Francisco from 1876 to 1890. Among prominent American kindergartners trained by Miss Marwedel are Kate Douglas Wiggin and Nora A. Smith. Her published writings include *Conscious Motherhood, or the Earliest Unfolding of the Child* (Boston, 1889), and *The Connecting Link to Continue the Threefold Development of the Child from the Kindergarten to the Manual Labor School* (San Francisco, 1890).

MARYLAND AGRICULTURE COLLEGE, COLLEGE PARK, MD.—A state institution established by legislature in 1856 and opened in 1859. The following departments are maintained: agriculture, botany and vegetable pathology, chemistry, civil, electrical, and mechanical engineering, physics, English and civics, entomology and zoology, horticulture, languages, mathematics, military service, ora-

MARYLAND

tory, physical culture, veterinary, and preparatory. Students are admitted by special examination. The degrees of B.S., M.S., A.M., M.E., and C.E. are conferred. The enrollment in 1910-1911 was 416. The teaching staff consists of thirty members.

MARYLAND COLLEGE FOR WOMEN, LUTHERVILLE, MD.—Chartered in 1853 and 1895 as an institution for the higher education of young women. Preparatory, collegiate, and music departments are maintained. High school graduates are admitted to the junior class. The degrees of A.M. and B.L. are conferred. The teaching staff consists of eighteen members.

MARYLAND, STATE OF.—One of the original thirteen states. It is located in the South Atlantic Division, and has a land area of 9860 square miles. In size it is about the same as New Hampshire or Vermont. For administrative purposes the state is divided into twenty-four counties, and these in turn into school districts. In 1910 Maryland had a population of 1,295,346, and a density of population of 130.3 per square mile.

Educational History.—The original colonial charter made no mention of education. In 1695 the colonial assembly passed two acts, one for the encouragement of learning, and the other a supplicatory petition for the erection of free schools. The first was repealed in 1704, and the second in 1696, and neither resulted in any action. In 1796 a "petitionary act for free schools" was passed, looking to the erection of free schools of a higher grade in each county. As a result of this, King William's School was founded at Annapolis as a preparatory school for William and Mary College. The plan inaugurated at this time, of founding one free higher school in each county, directed the educational efforts of Maryland for a century and a half, and is still to be seen in the annual appropriations to certain schools and academics, in consideration of the free instruction of a certain number of pupils. In 1723 a fund for the erection and support of a free higher school in each county was begun, by an import tax on pitch, pork, and tar; and trustees, called visitors, were appointed for each county, to manage the fund for each county, establish and maintain the school, and to have perpetual succession as a body. In 1728 the visitors were directed to see that the masters of each higher school taught as many poor pupils gratis as the visitors might direct. A county system of higher schools, or academics, was thus definitely established, and the principle of charity school education for the children of the poor became a fixed policy. What had been intended to be free schools, due to lack of funds with which to maintain them, were gradually transformed into pay schools with a fixed number of poorer pupils. Almost no mention of education occurs

in the laws from this time on until after the close of the Revolution. The schools languished for want of funds, and a number gave up their funds for other purposes.

The first state constitution, adopted in 1776, was amended twelve times during the next seventy years, but without any mention of the subject of education. The constitution of 1851 was similarly silent, except for the one provision forbidding ministers, teachers, and religious orders and sects from receiving property left as a legacy or gift for their support. The first mention of education occurs in the constitution of 1864.

In 1782 Washington College was established at Chestertown, on the east shore, and in 1784 St. John's College was established at Annapolis, on the west shore. Annual legislative grants forever, of £1250 and £1750 respectively, were promised, and the two institutions together were to constitute the University of Maryland. In 1798 the policy of dispersion, which has wrought such havoc in education in Maryland, was begun, when the annual grant to Washington College was reduced £500 and the sum spent in making grants of £100 each to five academies, two of which had just been chartered. In 1805 the University of Maryland act was repealed, and the money ordered to remain in the treasury until otherwise disposed of; and in 1811 the sum was ordered to be distributed to a number of schools and academies. In 1827, and again in 1831, unsuccessful attempts were made to divert the academy funds to elementary education; and in 1831 the academy grant was equalized to \$800 for each county. This system remains to the present time, the state virtually supporting two systems of secondary education. In 1823 each academy was ordered to receive at least one poor child for every \$100 of public money received, and this proportion has since been increased. The Maryland school law of to-day defines in detail the number and method of selection of the free pupils for these schools. In 1812 a new charter was granted to the College of Medicine in Maryland, and it was allowed to affiliate with its schools of law, divinity, and the liberal arts. The law and medicine faculties still survive, as departments of a so-called University of Maryland.

In 1799 the Benevolent Society of the City of Baltimore was organized to provide elementary education for the female children of the poor. In 1805 St. Peter's School for poor children was established. Between 1801 and 1817 many academies and higher schools were incorporated and aided, and during these years the lottery, as a means of aiding education, reached its height. In 1812 a school fund had been begun by a tax on banks, which in 1813 was changed to a rate of taxation on bank stock. In 1814 the unclaimed estates of persons dying intestate were added in Baltimore. In 1817 a lottery to raise \$50,000 a year for five years

was ordered, the proceeds to be added to the fund. In 1825 certain interest received from the United States was ordered added, and, in 1839, some railway stock was substituted for a portion of the Surplus Revenue previously added.

In 1816 the first direct tax, a tax on the property of five counties to provide schooling for the poor children of those counties, was levied, and later in the same year this tax was extended to all the counties of the state. The tax was to aid rather than to provide, and the children benefited were a class and not all.

In 1826 the first general school law for Maryland was enacted, but the uniformity of its action was nullified by the provision that the law could go into effect in any county only after its adoption by popular vote in the county. A Superintendent of Public Instruction for the state was to be appointed by the Governor; the justices of the levy courts in each county were to appoint a board of nine county commissioners, and eighteen additional inspectors of primary schools, who were to visit the schools once each quarter, and to report as to their condition. Counties were to be divided into school districts, and three district trustees, a district clerk, and a district collector, were to be elected for each. All teachers were required to hold teachers' certificates, issued on examination by the Inspectors. The income from the state school fund was to be apportioned to the counties and to the districts on the school census, and all additional funds were to be raised by district taxation. The act was to apply to the city of Baltimore, if within five years the city did not establish a system of schools. The law was so far in advance of public sentiment that it could not be put into operation, and the close of the Civil War found Maryland without any effective system of public instruction beyond the limits of the city and county of Baltimore (See BALTIMORE, CITY OF.) From this time on no further attempt was made to establish a state school system.

The state constitution of 1864 was the first to mention education. This, and the law of 1865 based upon it, provided for a centralized and an effective system of administration, with a State Superintendent of Public Instruction; an *ex officio* State Board of Education, county school commissioners appointed by the State Board of Education; a state school tax of not less than ten cents on the \$100; and an additional tax of five cents to build up a permanent school fund of \$6,000,000. The State Superintendent was to report to the next legislature a plan which would provide for a uniform system of free public schools for six months each year in each school district of the state. A normal school was established in Baltimore by the legislature of 1865.

In 1867 a new constitution was adopted, which is still in force; and in 1868 a new school

law was adopted as provided for in the constitution. This was more in harmony with the strong feeling of local liberty in the state, and has remained as the basis of the present system. The State Board of Education and the state superintendency were abolished, but some of the functions of the State Board were given to the board of trustees of the state normal school, and the principal of the normal school was made an *ex officio* superintendent. The board of county school commissioners was to be elected by the people instead of being appointed by the State Board. An elected "board of school-house district trustees" was created to appoint the teachers and manage the property of each school district. The school term was increased to ten months, and county taxation was authorized to supplement the state school money. No provision was made for the education of colored people, except to provide that taxes paid by them should be spent on their schools. This law was much more popular than that of 1865, and much greater progress was made under it.

In 1870 the 1868 law was repealed and reenacted with some changes. The State Board of Education was restored, under the name of State School Commissioners, and made to consist of the principal of the normal school and four others, appointed by the Governor from among the presidents and examiners of the county boards of school commissioners. County boards were, in turn, to be appointed by the judges of the circuit court, instead of elected, and school district boards were made to consist of three trustees, appointed annually by the county boards, instead of being elected. Life teachers' certificates were provided for for the first time. In 1872 provision was made for the establishment of schools for colored children in each county, and a state appropriation was made therefor. In 1874 the Governor was added to the State Board of Education (name changed in 1872), and the Board was given some legislative powers. The election of teachers by district boards of school trustees was made subject to the approval of the county boards. In 1904 the State Board of Education, and in 1906 the county boards of school commissioners, were reconstructed and given their present form.

In 1896 a normal department was organized at Washington College, Chestertown, and in 1898 a second state normal school was provided for at Frostburg. In 1908 a third state normal school was provided for colored teachers, to be located in Baltimore, and college courses in pedagogy were allowed to be approved by the State Board of Education for state certificates. In 1908 aid for high schools providing manual training courses was first given by the state, and in the same year state grants for commercial courses in high schools were also provided. In 1904 provision was made for an annual state grant of \$150,000, to be distributed

to the counties and to the city of Baltimore, on school census, to provide free textbooks. In the same year a law was enacted, providing for a minimum salary of from \$300 to \$450 per year for white teachers, and in 1908 this law was amended so as to provide higher minimum salaries for teachers of experience. A state pension law was also enacted in 1908, and an educational commission appointed. In 1910 the high schools were classified and standardized, and definite aid extended to them out of the state school fund.

Present School System. — The educational affairs of the state are under the care and supervision of a State Board of Education, consisting of the Governor, the State Superintendent of Public Education, and six citizens appointed by the Governor for six-year terms, two of whom must be of the minority political party. The principals of the state normal schools and the head of the normal department of any state schools are *ex officio* members, but without the right to vote. It is the duty of the State Board to carry out the school law, and in doing so they may make rules and regulations having the effect of law; they are to interpret the school law, decide disputes, and their decisions are final; to issue uniform blanks and to require uniform accounts and reports; to examine candidates for the office of county superintendent, and they may suspend or dismiss county superintendents for cause; to grant professional certificates to teachers of long and successful experience; and to act, *ex officio*, as a Board of Trustees for the state normal schools, and to approve a pedagogical course for colleges wishing to be permitted to grant teachers' certificates to their graduates.

The State Superintendent of Public Education is also appointed by the Governor, for a four-year term, and may be removed from office by the State Board of Education by a two thirds vote. His salary is fixed by the State Board. He is *ex officio* a member of this body, and its secretary and executive officer. It is his work to inform himself as to the condition of education in Maryland; to work to improve educational conditions; to receive and examine all reports from county boards; to endorse normal school diplomas from other states; to arrange dates for teachers' institutes, and to help in the preparation of the program; to print and distribute the laws, an Arbor Day pamphlet, an Institute Manual, the Proceedings of the Maryland Teachers' Association, and such circulars as may be needed; to serve *ex officio* as a member of the State Library Commission; with the principal and one of the faculty of a state normal school to examine the high schools of the state and to report the results to the State Board of Education; and personally to inspect the manual training courses in the high schools of the state, and to approve them for state aid.

For each county there is a board of county school commissioners, also appointed by the

Governor. In six of the larger counties the board consists of six members; in the remaining counties, of three. The term of office is six years, one third appointed every two years, and one third being of the minority political party. No teacher is eligible, and the Governor may remove any member for cause. This board elects the county superintendent of public education, who also acts as treasurer and secretary of the board. The county board has general supervision and control of the schools of the county, and may make rules and regulations, not contrary to law, for that purpose; may select sites, build, repair, and furnish schoolhouses; is to adopt, purchase, and distribute the textbooks to be furnished; must approve the appointment of the principal teachers for all schools, and appoint all assistant teachers, on the advice of the principal; may consolidate schools and transport pupils; may determine the amount of county school tax to be levied; may change the boundaries of districts as seems desirable; hears all charges against teachers, and settles all disputes within the county subject to appeal to the State Board; must maintain one or more free schools for colored children in every election district; must maintain a high school when presented with a high school building by any election district or districts; and must make a report annually to the State Board of Education and to the people of the county.

The county superintendent of public education, elected by the county board, acts as its executive officer. He examines all candidates for county teachers' certificates, and grants certificates to those who pass; must visit each school in the county from one to three times each year, depending upon the number of schools in his county; attends all meetings of the board, and may speak, but has no vote; prepares an annual report for the State Board; and must devote his entire time to the work of supervision. His salary is fixed by the county board.

For each school district a board of district school trustees is appointed each year by the county boards. Each district board is allowed, on approval by the county board, to elect its principal teacher, who thereupon becomes *ex officio* secretary of the district board. These boards have the care and repair of the schoolhouse and furniture of the district; may make repairs, if approved by the county board; may exercise general supervision over the school, subject to the rules and regulations of the county board; may admit, suspend, or expel pupils and may levy additional district taxation to provide a longer term of school. The city of Baltimore is a district operated under a special charter. (See BALTIMORE, CITY OF)

School Support. — Maryland received no school lands, and the permanent school fund, including the Surplus Revenue fund, which has

but a nominal existence, is about one million dollars, and yields about \$50,000 a year, or about 1.5 per cent of all revenue raised. The annual state school tax of sixteen and one eighth cents on the \$100 produces about 40 per cent of all money raised. The remainder comes from the free school fund, and grants for secondary education. The annual state grant of \$150,000 for free textbooks now comes out of the general state school tax. About 58 per cent comes from a county school tax of fifteen cents, which, by agreement between the county school board and the county commissioners, may exceed fifteen cents. The total amount expended for education in 1909-1910 was \$4,060,341, of which 44 per cent was expended by the city of Baltimore.

Educational Conditions. — Of the population of 1910, about 20 per cent were negroes, and about 90 per cent were native born. Of the foreign born, one half were Germans and one sixth Irish. Only in three counties do the negroes equal the whites in number. It is necessary to maintain two school systems for the two races. Aside from the city of Baltimore, which contains 42.8 per cent of the total population of the state, the state is essentially a rural state, as 49.2 per cent live in rural districts.

The law requires a school term of ten months "if possible." The average length of term for eleven counties and the city of Baltimore was ten months, for eleven counties it was nine months. In respect to length of term provided, Maryland ranks with the New England states. The attendance, however, is poor, being but an average of 102.9 days for each pupil enrolled in 1909. Twenty-one per cent of the total enrollment and 22 per cent of the teachers were in the colored schools, which is more than their percentage of the total population. The state has no general compulsory education law, which accounts for these low figures. Baltimore city and Allegheny County enforce attendance. Of the total population of 1900, ten years of age or over, 11.1 per cent were illiterate. Of the two races, 5.2 per cent of the whites and 35.1 per cent of the colored race could not read or write. The average value of all the schoolhouses in the state, including the city of Baltimore, is but about \$1600. In the rural districts, and particularly in the negro districts, many of the school buildings are of small value.

Teachers and Training. — The state employed 5414 teachers in 1910, 3736 being outside of the city of Baltimore. Of this number 823, or 22 per cent, were employed in the colored schools, 212 being in the city of Baltimore. No statistics are available to show the kind and amount of training which these teachers have had. Two grades of county teachers' certificates are issued on examination, the difference being in the subjects examined on. A very meritorious provision is that each

MARYLAND

certificate is valid for six months after obtaining a school, after which, if the Superintendent's inspection warrants, the certificate is made valid for five years. County superintendents must hold a certificate issued by the State Board of Education, which also issues, without examination, life diplomas for seven years of successful teaching, five of which must have been in Maryland. Normal school diplomas from outside of the state may be accepted by the State Superintendent, and the diplomas of the three state normal schools and the normal department of Washington College are also accepted in any county.

SCHOOL	LOCATION	FOR MAINTENANCE	FOR
Maryland State Normal School	Baltimore	\$20,000	Whites
Maryland State Normal School	Frostburg	7,000	Whites
Normal Department Washington College	Chestertown	4,500	Whites
Maryland State Normal School No. 3	Baltimore	5,000	Colored

The salaries of teachers are fixed by the county board, at the time of employment, except that no white teacher can be paid less than \$300 a year, and no white teacher of three years' experience less than \$350 a year. If the teacher holds a first-class certificate and has taught in Maryland five years, the minimum is \$400, and if eight years, \$450. Any incapacitated or indigent teacher of sixty years of age or more, who has taught twenty-five years in the schools of Maryland, may be retired on an annual pension of \$200.

MARYLAND

The Maryland Teachers' Reading Circle was established in 1890, for the improvement of teachers in service, and the law requires that this shall be encouraged by the State Board of Education. A teachers' institute, of at least five days, must be held in each county, and teachers are required to attend. The state now maintains four normal schools (see above table). For each of these, county and city boards of school commissioners are to select candidates for admission and grant a certain number of scholarships for the course.

Secondary Education — The state at present maintains a double-headed system of secondary education, and, as a result, few good public high schools, outside of Baltimore, have been developed in the state. Many of the old academies have surrendered to the state and become public secondary schools, but seventeen of the old incorporated academies and schools still receive state grants of from \$150 to \$3000. The law of 1910 attempted to classify and standardize the high schools of the state, provided definite state aid for approved schools, to be paid from the state school fund instead of by special appropriations, and made the approval of both the County and the State Board of Education necessary for the establishment of new schools. This new law will do much to give Maryland a good system of secondary education. The county agricultural high schools, provided for in 1912, will also prove a very important feature.

Higher and Special Education. — The same policy of dispersion of aid which characterizes secondary education also applies to higher and special education. The University of Maryland consists only of medical and law departments, first opened in 1807 and 1814 respectively. The Maryland State Agricultural

College, at College Park, was opened in 1859. Some state aid has from time to time been extended to Johns Hopkins University. In 1912 a state school of technology was established in connection with the university, with a state tax of $\frac{1}{2}$ cent annual revenue. This will produce \$50,000 each year. The dispersion of educational effort may be seen from the table of colleges in the state on previous page.

The state maintains the Maryland School for the Deaf and Dumb, at Frederick; and grants state aid to St. Mary's Industrial School (for boys) and St. Peter Claver's School, both at Baltimore. The Maryland (reform) School for Boys, at Baltimore, and the House of Reformation, for boys, at Cheltenham, are supported by public funds. E. P. C.

MARYVILLE COLLEGE, MARYVILLE, TENN.—A coeducational institution founded in 1819. Preparatory, collegiate, education, music, and art departments are maintained. The entrance requirements are fifteen units. The degree of A.B. is granted by the institution. The total enrollment in 1911-1912 was 649. The teaching staff consists of thirty-nine members.

MASON, LOWELL (1792-1872).—First apostle of public school music in the United States. He was born at Medfield, Mass., and received the rudiments of an elementary education in the common schools. After several years of teaching in the district schools of Massachusetts, he went to Georgia, where he taught music and conducted choirs and singing societies. Returning to Boston in 1827, he organized the Boston Academy of Music with the aid of William James Webb (*q.v.*). Through William C. Woodbridge (*q.v.*) he became interested in the Pestalozzian movement and went to Switzerland to study the work of Nägeli (*q.v.*) and Pfeiffer. He brought back with him a collection of Swiss and German schoolbooks containing class music and songs.

Failing in his efforts to induce the city of Boston to include music as one of the required studies of the elementary schools, he organized classes of children on Wednesday and Saturday afternoons and taught gratuitously from five to six hundred children for several years. The juvenile concerts that he gave from time to time convinced the people of the value of his work, and music was made one of the required subjects in the course of study.

In addition to his work with the children and the Boston Academy of Music, he was president of the Handel and Haydn Society, and in a variety of ways he sought to improve and extend musical taste in New England through the giving of concerts, the formation of singing societies, the organization of church choirs, and the establishment of lecture courses on musical subjects. In 1837 he became associated with Horace Mann (*q.v.*), and during the next twelve years he gave much of his time to the training of teachers of common school music in the institutes and normal schools of Massachusetts. "His long continued work as a practical teacher, his rare tact in developing the vital principles of instruction, his sympathy with youth and childhood, and the perfect simplicity and elementary character of his teaching gave him an indescribable power over his audiences."

His influence was likewise great through his published works. His *Juvenile Psalmist* was published in 1829. It was one of the first music books ever published for Sunday schools, and it was widely used. During the next few years he published fourteen music books for children. He also published many works for glee clubs, church choirs, and singing societies; and his *American Tune Book*, six hundred thousand copies of which had been sold before his death, greatly enriched American hymnology. As a creative tone artist, he limited his efforts to church tunes; but many of these are highly creditable productions. His contributions to the pedagogy of music may be found in the *Proceedings of the American Institute of Instruction* and the educational journals of his day. W. S. M.

MASON, LUTHER WHITING (1821-1896).—Music educator and author. He was self-educated, became supervisor of music in the schools of Kentucky and Ohio (1853-1861), and during the Civil War served as a drum major. From 1865 to 1880 he was connected with the public schools of Boston as supervisor of music. The next three years (1880-1883) he spent in Japan as organizer of public school courses of music in that kingdom. He wrote a series of music textbooks widely used in the United States. W. S. M.

MASSACHUSETTS AGRICULTURAL COLLEGE, AMHERST, MASS.—A coeducational institution established under the Morrill Land Act of 1862 and opened in 1867. In 1882 the state experiment station was located at and later incorporated with the college. All instruction is free to citizens of

MASSACHUSETTS COMMISSION

Massachusetts, to candidates who meet the entrance requirements — fourteen units of high school work. The following departments are maintained: agriculture, horticulture, botany, entomology, plant and animal chemistry, veterinary science, mathematics, social sciences, and humanities. Extension work is conducted by the college, and provides short courses, lecture courses, and correspondence courses. The degrees of B.S., M.S., and Ph.D. are conferred by the college. The enrollment in 1911-1912 was 520. The faculty consists of sixty members.

MASSACHUSETTS COMMISSION OF INDUSTRIAL AND TECHNICAL EDUCATION. — See COMMISSIONS, EDUCATIONAL.

MASSACHUSETTS INDUSTRIAL COMMISSION. — See COMMISSIONS, EDUCATIONAL.

MASSACHUSETTS INSTITUTE OF TECHNOLOGY, BOSTON, MASS. — An institution incorporated in 1861 for the purpose of "aiding generally by suitable means the advancement, development, and practical application of science." It was not until 1865 that it was possible to make an actual beginning even with the most modest equipment in leased rooms of a building in Sumner Street, Boston. The equipment in men, however, was strong from the beginning, the best known of the original faculty of ten being Rogers, the founder and first president, and Eliot, afterwards president of Harvard. The courses in these early days were especially designed to prepare men for mechanical and civil engineering and for the professions of the architect and the chemist. In 1881 President Rogers was succeeded by General Francis A. Walker, under whose guidance the number of students increased from 300 to 1200 and the number of the instructing staff from 39 to 153. Following General Walker were: James M. Crafts (1897-1900), Henry M. Pritchett (1900-1907), and Richard C. Maclaurin (1909-).

The Institute is one of the land grant colleges, and in addition to the income that this position secures, it receives an annual grant of \$100,000 from the legislature of Massachusetts. Its tuition fee is \$250, and its budget for 1911 was \$615,571. The government is vested in a Corporation, consisting of five *ex officio* members, thirty-five life members, and fifteen members elected for terms of five years from a group of candidates nominated by the alumni. The Corporation conducts much of its business through an Executive Committee consisting of the president, treasurer, and five other members. The instructing staff in 1911 consisted of 245 members, of whom 91 were of professorial grade. These professors constitute the faculty, which has the immediate supervision of all matters relating to the courses of instruction and to the admission and conduct of

MASSACHUSETTS, STATE OF

students. Exclusive of the summer school, the number of students in 1911-1912 was 1566, of whom 399 were from other colleges, and 212 were college graduates representing 112 colleges. Over a hundred came directly from foreign countries and almost every state in the Union was represented. There were only seven women, although women are admitted to any of the courses. The regular course of undergraduate study runs between the end of September and the beginning of June for four years, and leads to the degree in any one of the following fourteen branches: civil engineering, mechanical engineering, mining engineering and metallurgy, architecture, chemistry, electrical engineering, biology and public health, physics, general science, chemical engineering, sanitary engineering, geology and geodesy, naval architecture and marine engineering, and electrochemistry. In each of these courses a large proportion of work of a literary and scientific character is insisted upon, and a serious effort is made to break down the barriers between professional and cultural studies. Opportunities are also afforded for study and research leading to the advanced degrees of M.S., Ph.D., and Doctor of Engineering. Although research is carried on in all departments, there are laboratories especially designed for purposes of research in physical chemistry, applied chemistry, and public health, and contributions from these laboratories are published periodically by the research departments. R. C. M.

MASSACHUSETTS, STATE OF. — One of the most important states, educationally, in the Union. The first permanent settlement in New England was made at Plymouth, in 1620. Salem was settled in 1628, and Boston, Charlestown, Newtown (Cambridge), Roxbury, Dorchester, and Watertown were settled by the Massachusetts Bay Company in 1630. The Massachusetts Bay Colony at once became the leading colony, and in 1691 Plymouth Colony was united to it by the new charter granted by William and Mary, which remained in force until the Revolution. In 1788 Massachusetts entered the Union, as one of the thirteen original states. In size the state has but 8039 square miles, being fifth from the smallest state, but in population it ranked sixth from the largest in 1910, and the density of population, 418.8 per square mile, is only exceeded by that of Rhode Island.

Its population in 1910 was 3,366,416. For administrative purposes the state is divided into 33 cities and 321 towns. The towns are small, being somewhat analogous to a Western township. The cities are towns which have incorporated under a city form of government, or a segregated area so incorporated. There are also fourteen county divisions, but these are little used.

Educational History. -- Education began in Massachusetts under most favorable auspices. The colonists who settled in the Massachusetts Bay and Plymouth colonies were men of broad and liberal education, who had come to the new world for conscience' sake. The population of our country has never been so highly educated since as it was during the first fifty years of Massachusetts history. Many had been educated in the endowed grammar schools of England, and one man in every 250 was a graduate of an English university. Almost all had been conspicuous in Church and State in the mother country before coming to the new world. Their religion called for a knowledge of God's word, and this in turn called for education. They early set up schools, patterned closely after those they had known at home. Fearing that education and religion might die with the first generation, they provided at once for institutions to perpetuate both.

The beginnings of education in Massachusetts were made at Boston, in 1635, when the town, then five years old, requested Brother Philemon Purport to become schoolmaster. The Boston Latin School traces its history back to this time. (See BOSTON, CITY OF.) The next year the General Court of the colony voted an appropriation of "£400 toward a school or college," which was located at Newtown in 1637. In 1638 John Harvard, dying, bequeathed his library and half his property to the new college, and the name of Harvard College was given to the new institution, and the town where it was located was renamed Cambridge, in loving memory of the *alma mater* of so many of the early colonists. The grant made by the court for the new college was a most important one, and was equal to the entire colony tax for a year.

Other towns also established schools at an early date. Charlestown arranged with William Witherell in 1636 "to keep a schoole for 12 month, to begin the 8 day of August, and to have £40 this year." In 1637 Rev. John Fiske opened a school in Salem. Dorchester opened a public tax-supported school in 1639. Newbury granted ten acres of land to Anthony Somerby in 1639 "for his encouragement to keep a school one year." Schools were opened in Ipswich in 1641, Cambridge in 1642, and Roxbury in 1645. In 1641 the General Court appealed to the elders of the church to prepare "a catechism for the instruction of youth in the grounds of religion." In 1642 the court

enacted the first school law of the colony, which was an attempt to provide generally what a few towns had so far provided individually.

By this law the court, in view of the neglect of many parents and guardians in the training of their children "in learning and labor . . . profitable to the commonwealth," ordered the selectmen of the towns to take account of all parents and masters as to their children's education and employment. They were to divide the towns so that each should have the oversight of a certain number of families, and they were to see that the children could read and understand the capital laws of the country, and that they were also put to some useful work. Parents or masters refusing to give proper accounts were to be fined, and their children might be taken away from them. The civil authorities might be called upon by the selectmen to secure the enforcement of the law. This law laid down certain principles of fundamental importance in the matter of public education. Education was by it declared to be necessary for the welfare of the colony; the obligation to furnish it was placed upon the parent; and the right of the colony to compel parents to furnish it was asserted.

Five years later, in 1647, the colony in a new law went still further, and required the towns to furnish a school or schools. This law of 1647, commonly known as "that old deluder Satan law," is the real foundation of the Massachusetts school system, and has often been called the mother of all of our school laws. A college had been established, and elementary schools and grammar schools were now ordered established in all towns. Every town of fifty families must appoint a schoolmaster to teach the children of the town to read and to write. The wages of the schoolmaster were to be paid by the parents, or by the town, as the majority might order. Every town of 100 families must also provide a grammar school, the master of which was to be able to instruct the youths sufficiently to enable them to enter the university. In 1654 the court ordered that all teachers must be sound in the faith and free from scandal in their lives, on pain of dismissal. Plymouth Colony also attempted somewhat similar legislation, though somewhat later, and on the union of Plymouth Colony with that of Massachusetts Bay in 1691, the law of 1647, with its various amendments, became the common school law for the entire united colony. In this new law the colony laid down still further fundamental principles. Towns were now to be compelled to provide schools; a standard of instruction was fixed by the colony; public taxation could now be resorted to to provide what the colony required; and higher education, leading to the university, also must be provided, and might be provided at public expense. The law of 1654 declared the right of the colony to examine and certificate all teachers. These principles were so fundamen-

tal in their nature that we have acted along these lines ever since, while they were at the same time so far in advance of the people that it was found difficult to enforce the laws, and even Massachusetts has not fully caught up with them yet.

The fine for failure to comply with this law was at first fixed at £5. A supplementary law of 1683 further required all towns of 500 families to maintain two grammar schools and two writing schools, and in the reenactment of the laws in 1692, under the new province charter of 1691, the penalty for neglect to maintain the required schools was raised to £10. In 1701 the Massachusetts Court complained that the law was "shamefully neglected by divers towns, and the penalty thereof not required." At the same time the penalty was increased to £20, and a law was enacted whereby the master of the grammar school must be approved by the minister of the town and by the ministers of the two nearest towns, or by any two of them, and providing that no minister could be accepted as the schoolmaster of his town.

The grammar schools of Massachusetts did much, during the seventeenth century, to contribute to the fame of the colony as an educational center. The work of Ezekiel Cheever (*qv*), and of Elijah Corlett, who taught the school at Cambridge for forty-three years, are especially noteworthy. Other towns founded grammar schools during the seventeenth century, many of which were locally famous. Many grants in aid of schools, such as the grant of Thompson's Island to the town of Dorchester in 1636; the grant of 1000 acres of land by the General Court in Cambridge in 1659, for the support of a grammar school; the will of Thomas Bell in 1671, granting 200 acres of land to support a school for the children of the poor in Roxbury; and the income from the Cape Cod fisheries, granted by Plymouth in 1670, were made during the seventeenth century for the support of schools.

In the eighteenth century conditions changed. The early fervor for schools and learning in large part died out. It was a period of warfare and invasion, on the one hand; and of the founding of new settlements and towns, with a westward movement of the population, on the other. Between 1700 and 1760, 123 new towns were founded, and in the next ten years forty-five more, nearly all of which were west of the Connecticut River. Schoolmasters were becoming scarce, even by the end of the seventeenth century, due largely to the unwillingness of the towns to bear the financial burden of the schools; and special favors began to be granted to them in lieu of proper wages. In 1692, as an inducement to enter the work, teachers were exempted from taxes; in 1693 they were exempted from militia duty; and in 1699 they were exempted from the watch. Women teachers, too, became more common,

and the dame schools were gradually absorbed into the town school system. The "moving school" (*qv*) became common in the newer and more sparsely settled towns. Towns which felt themselves too poor to provide a sufficient number of schoolmasters employed one and sent him around among the districts, and he gave instruction in each in proportion to the contribution of each toward his support. The support of the required grammar school, too, became a grievous burden, and many towns were indicted for failure to comply with the law. In a few towns it, too, became a moving school. The school spirit declined, and the school decayed.

The constitution of 1789 and the school law enacted by the new state embodied into law the practices as well as the principles of the past 150 years. The old laws had contained requirements so high that they could not be enforced. While retaining the old principles, the new law set requirements capable of being enforced. The district system was legalized. Towns of fifty families were to support an English school for six months, instead of the whole year as before, and the school might be split up into any number of sessions. Towns of 100 families were to continue such a school for an aggregate of twelve months in each year. Towns of 150 families were to maintain an English school for twelve months, and a grammar school for six months, though such schools might be held in any number of places during the required time. Towns of 200 families were to maintain both schools for an aggregate of twelve months. The old law had required a grammar school in every town of 100 families, while the new law freed 120 towns from the old obligation. In 1824 another law freed all but seven towns, all of them commercial towns, from the ancient obligation. With the rise of the privately endowed academy having a more modern course of study the old grammar schools died out, and in many towns almost faded from memory.

All teachers in the higher schools were required by the law of 1789 to be college graduates, though, instead, a certificate from "a learned minister, well skilled in the Latin and Greek languages, settled in a town where the school are proposed to be kept," or from two equally well qualified ministers in near-by towns, would answer as well. Teachers in more elementary schools must also obtain a certificate, and the effects of the War of the Revolution are shown in the new requirement that only citizens of the United States could be employed as teachers, under penalty of a fine of 20s. a month. Ministers, selectmen, and other persons were enjoined to "use their best endeavors" that all should attend the schools, and the ministers and selectmen were appointed a visiting committee to look after the schools.

The decline in the desire for schools and learning, which set in in the eighteenth cen-

tury, continued and became more marked, and the first fifty years of the existence of Massachusetts as a state was a period during which the town schools reached their lowest level. The moving school and the district system (*q.v.*) destroyed the efficiency of the common schools, and the rise of the academy undermined the old town grammar schools.

For the purpose of locating the districts in which the moving school should be held, the towns had been laid off into districts. By the law of 1789 the division into districts was legalized and the district system established, and in 1800 the power to levy a local tax was granted. This meant the breaking up of the town into school districts, each with its own school, or fraction of a moving school. With the disintegration of the towns the old grammar schools disappeared. In 1817 these school districts were given full corporate powers, and in 1827 the full culmination of the district system was reached when the towns were required to appoint a prudential committeeman for each school district to care for the school property of the district and to select and appoint the teacher for the school. Towns might allow districts to select their own committeemen, and this procedure was the one usually followed. As Mr. Martin has so well expressed it, "the year 1827 marks the high-water mark of modern democracy, and the low-water mark of the Massachusetts public school system." Horace Mann termed this legislation the most unfortunate ever enacted for the schools of Massachusetts.

The first of the endowed academies was opened in Newbury in 1763. William Dummer, dying in Boston in 1761, left his mansion house and farm at Newbury to found and endow a school, to be maintained on the estate. In 1782 its name was changed to Dummer Academy. In 1778 Phillips Academy was established at Andover, in 1784 Leicester Academy was founded; and in rapid succession other academies were opened at Derby, Bristol, Marblehead, Westford, Westfield, Plymouth, and New Salem. To three of these state aid was granted in the form of Maine lands. Numbers of petitions for similar aid and charters now came in, and in 1797 a legislative committee was appointed to determine the future policy of the state toward these institutions. The report favored the continuance of the policy of aiding, by means of grants of land, these privately endowed academies, and by 1840 as many as 112 acts of incorporation had been granted for academies to be located in eighty-eight towns, and in every county of the state. These institutions were intended to prepare boys for the colleges. Their curriculum was more modern than the old grammar schools had provided, and many able students were attracted to them. A few took first rank; many others possessed only a local reputation. They upheld a higher standard of education and

teaching than the grammar schools had done. Under their influence Harvard College was able materially to increase its entrance requirements. On the other hand, the academies fostered the idea of private education, and thus acted injuriously on the public school idea. The wealthier patronized the tuition schools, and the poorer were left to get what they could from the free town schools. The limited and inefficient town schools led to the founding and endowing of the academies, and the more the academies succeeded and prospered, the poorer the town schools became. At about the same time that the district system became supreme the academies reached their greatest development. These were dark days for the public school idea. Boston made the beginnings of a new movement by the establishment of the English High School in 1821, the first public high school in America, a high school for girls in 1825; and the first evening high school in 1836.

Against this condition of apathy and indifference a number of public-spirited men began an energetic campaign. Mr. James G. Carter (*q.v.*) was the leader of the movement. Beginning in 1820, as a young college graduate, he devoted his energies for seventeen years to the building up of a sentiment for public education which finally culminated in the establishment of the Massachusetts Board of Education in 1837. With his voice and his pen he depicted the low state of education in Massachusetts, and aroused the state to action. Largely as a result of his efforts a number of laws of the first importance were soon enacted.

The first was a law which put a slight check on the district system, by differentiating school interests and instituting supervision. The law of 1789 had first required a form of supervision, through the medium of the ministers and the selectmen, or by a committee especially chosen for the purpose. Many towns took advantage of this and appointed school committees. School committee records in Newburyport date back to 1790; in Boston to 1792, and in Hingham to 1794. A law passed in 1826 made the appointment of a school committee compulsory, and gave to them charge and superintendence of the schools of the town. They could also determine the textbooks to be used, and were to examine and certificate all teachers. The districts objected most vigorously to this law, and the next year it was so modified as to virtually nullify it in many towns.

In 1827 another new law was passed, which, for the first time in the history of the state, made the entire support of the schools by taxation compulsory. Since 1647 support by taxation had been permissive and voluntary, and the schools of many towns had been so supported. In others fees had been charged, rate bills levied, voluntary contributions made, and various forms of maintenance employed. The law of 1827 made taxation compulsory on all

towns, and put into effect, after 180 years, the principles enunciated in the law of 1647.

In 1834 another bill of importance provided for the creation of a school fund, not to exceed one million of dollars. The Maine lands were to be the chief source of the fund, and, profiting by the experience of New York and Connecticut, the distribution of the income of the fund to the towns was made contingent on the raising by the towns of at least \$1 for each child of school age (four to sixteen years) and in addition making the school returns required by law.

In 1836 the first law relating to child labor was enacted. By it the employment of children under fifteen years of age was forbidden, unless they had attended school for three months during the school year.

In 1837 the act of the greatest importance of all was passed, creating the Massachusetts State Board of Education, to be composed of the Governor, Lieutenant Governor, and eight members to be appointed by the Governor, for eight-year terms, one to retire each year. They were to choose as their executive officer a secretary, and it was made his duty "to collect information of the actual condition and efficiency of the common schools and other means of popular education; and to diffuse as widely as possible throughout every part of the commonwealth, information of the most approved and suitable methods of arranging the studies and of conducting the education of the young." The board was without authority to enforce. Its work was to study conditions, publish results, and to persuade communities to take proper action. It was also to appoint assistants to the Secretary, known as agents, who were to travel about the state studying conditions. At one time the board had six of these in the field, examining schools, advising committees, and stimulating communities to action.

On June 29, 1837, Horace Mann (*qv*) was elected as the first secretary, and was reelected annually for twelve years. With him began the great revival in education, not only in Massachusetts, but in New England, and its influence was felt in every Northern state. The history of this important period is largely the history of the work of Horace Mann himself. A new school system was created by his efforts; uniformity was introduced, a new interest in public education was awakened; and the new system virtually created was accepted by the legislature and the people, and has continued and developed ever since. The influence of his work extended to every Northern state, and the period of his labors is known in history as that of the great educational revival.

In 1838 the first public normal schools in the United States were established, partly by the legislature and partly by private support, two being opened at Barre and Lexington in 1839, and a third at Plymouth in 1840. In 1842 these schools were definitely adopted by the

state and named state normal schools. A fourth state normal school was established at Salem in 1854, a state normal art school at Boston in 1870, a sixth normal school at Worcester in 1874; and four additional schools were established in 1894. In 1847 the Lyman Industrial School for boys was established at Westborough, and in 1856 a similar school for girls was established at Lancaster. In 1847 the legislature authorized the towns to provide supplementary schools for adults, and ten years later such schools were made an integral part of the school system. In 1883 the support of such schools was made compulsory on all towns having a population of 10,000 or over, and in 1886 the support of an evening high school was also made compulsory on all towns of 50,000 inhabitants or over. In 1848 state grants of aid for teachers' associations were made for the first time.

In 1850 the first truancy law was enacted, the towns being permitted to enact by-laws to remedy the evil. As this proved ineffective, and as the number of persons in the state who could not read and write was rapidly increasing, due to foreign immigration, and as such persons have always been looked upon with distrust by the state, the legislature enacted, in 1852, the first compulsory attendance law in the Union. By the terms of this law parents were required to send all children between eight and fourteen to school for at least twelve weeks each year, unless excused from attendance on account of poverty, or because otherwise instructed. The school committee was to notify the town treasurer of violations, and he was to enforce the law. The exemptions and indirect provisions for enforcement practically nullified the law. In 1862 the towns were required to make by-laws against truancy, and in 1873 they were also required to appoint truant officers, and the appointment was given to the school committee instead of to the town authorities. Later the twelve weeks were changed to twenty weeks, and then to thirty weeks, and in 1898 all children seven to fourteen years of age were required to attend school during all of the time the public schools are in session. The poverty excuse was removed, and, later, the option of attending private schools was to be allowed only after the private schools had been approved by the school authorities.

In the early fifties a strong demand was made by the churches, in a number of states, for a division of the school money; and in 1853 the demand was made in Massachusetts. Not only was the demand refused, but the legislatures of 1854 and 1855 in succession approved of an amendment to the state constitution forever prohibiting such a division of funds. This was ratified at once by the people, and at the same time the daily reading of the English Bible in the schools, which up to this time had been voluntary, was made compulsory. Subsequent acts have so modified the law that the

children of parents who object may be exempted from attendance.

The first superintendent of schools in Massachusetts was employed by Springfield in 1840; but it was not until after Boston, in 1861, employed a superintendent that supervision became an important feature of the school system of the state. The commercial and manufacturing cities adopted the idea first, and from these centers it has extended to the whole state, — every child and teacher in the state now having the benefit of close and professional supervision. In 1888 the union of towns to employ a superintendent of schools was authorized, and the plan of aiding small towns to employ a superintendent of schools was begun, and in 1900 the formation of unions and the employment of a superintendent was made compulsory on all towns after July 1, 1902. Aid was also given to the poorer unions for the salaries of their teachers, where a superintendent is employed and receives state aid.

The law of 1647 had required instruction in reading and writing, and to this the law of 1789 had added English language, orthography, arithmetic, and decent behavior. In 1826 geography was added, and in 1857 the history of the United States. In 1858 drawing was made an optional subject, and in 1870 it was added to the list of regular studies. In 1885 instruction in temperance physiology and hygiene was added to the list, and in 1908 instruction as to tuberculosis and its prevention. In 1869 the consolidation of schools was authorized, and much has been done since 1885 in this work. In 1872 towns were authorized to support free industrial schools, but little was done in this direction until quite recently. In 1873 towns were permitted to furnish free textbooks and supplies to pupils, and in 1884 this was made a compulsory requirement. In 1893 school committees were authorized to provide evening lectures. In 1894 every town of 20,000 inhabitants was required to provide instruction in manual training as a regular part of its course of instruction. In the same year a law was passed providing for the inauguration of a state system of examination and certification of teachers, but no appropriation to carry the law into effect was made, and after remaining a dead letter for a number of years, it was repealed. In 1895 a high school tuition law was passed by which small towns were to be reimbursed for all or part of the tuition paid for the attendance of their pupils in other towns, and in 1898 the high school law was reenacted and made quite definite in the matter of its requirements on the towns. In 1898 the term of school required of small towns was increased from six to eight months. In 1899 the support of vacation schools was authorized. In 1906 the State Board of Education was directed to establish a state registry bureau for the employment of teachers. Medical inspection, made permissive at first, was re-

quired of cities and towns in 1906, the bill requiring the appointment of school physicians in each town or city, and making an annual examination of each school child compulsory. In 1908 an act was passed requiring all towns of over 10,000 inhabitants, not provided with proper playgrounds, to vote at the next election on the question of providing such. One playground was required for the first 10,000 inhabitants, and one for every additional 20,000. Of the twenty-five cities voting, twenty-three accepted the law. In 1908 a law authorized cities and towns to establish a pension law.

In 1905, on the recommendation of Governor Douglas, a Commission on Technical and Industrial Education was appointed. This commission made a very valuable report in 1906, and among other things recommended the creation of a Commission on Industrial Education of five to consider and plan for a comprehensive system of industrial and technical education for the state. This was done, the commission being created for three years, and being independent of the State Board of Education. In 1909 the legislature reconstructed the State Board of Education by abolishing both it and the Industrial Commission, and creating a new State Board of Education to consist of one member of the Industrial Commission, four members of the old state board, and four additional members, all to be appointed by the Governor and to serve for three-year terms, after the first appointments, to secure a retiring one third each year. The appointments were made during the early part of 1909, and the old State Board of Education, created in 1837, gave way to a new and a somewhat similar body, created to secure greater initiative and a more progressive policy. The old office of Secretary was abolished, and a Commissioner of Education was appointed instead. This is the most important change made in the Massachusetts school system in decades.

Present School System. — The new State Board of Education, created by the act of 1909, appoints as its executive officer a Commissioner of Education, and two Deputy Commissioners. The Commissioner is appointed for five-year terms, but may be removed from office at any time by a two-thirds vote of the Board. The board is free to go anywhere to secure these men.

The State Board of Education acts as a trustee for any funds created or donated for educational purposes; has control of the distribution of the income from the school fund to the towns, subject to the authority of the legislature; has charge and supervision of the normal schools of the state, acting as a board of regents, or trustees, for the ten schools; prescribes the form of all census returns, registers, and reports; requires all public schools, and all private schools, reform schools, and almshouses to report to it in full each year as

to their work and finances; has charge of the education of the deaf and blind of the state in institutions; since 1906 has conducted a teachers' registry bureau; arranges for teachers' institutes, and grants state aid to those properly organized; approves (certificates) superintendents of schools for such supervisory unions as receive state aid; and may form and readjust such unions so as to provide supervision for stranded towns. Succeeding to the powers of the Industrial Commission, it will have power to investigate the need for and to extend industrial education; to provide lectures on the subject; to visit and report on all such schools; to initiate and superintend the establishment and maintenance of such schools, with the cooperation and consent of the municipality involved; and to expend all state money appropriated for the purpose of aiding such schools. The board is required to make a detailed annual report to the legislature, showing the condition of education in the state and the work done by it and its executive officers. The seventy-five annual reports so far made by the board are of very great value, and might serve as models for other states. The board possesses little real power or authority, and most of its acts in the past have been performed through its secretary, or its agents. This will doubtless continue to be the case with the new board and its commissioners.

Each city and town has control of the schools within its boundaries. Cities, except as provided in their charters, operate under the general school law. A school committee, elected by the city or town, has charge of the schools in each. A number of cities operate under special charters or laws, and have different forms of organization, but all conform to the general school law in most particulars (See articles on BOSTON; CAMBRIDGE.) Each city or town is free to outline and prescribe its own studies, there being no state course of study or state requirements beyond the list of statutory school subjects and certain requirements as to types of schools which must be maintained by the larger towns. Each city or town of 10,000 inhabitants must provide evening schools for the instruction of those over fourteen years of age; every city or town of 20,000 inhabitants must provide instruction in manual training, as a part of its elementary and high school courses; every city and town of 50,000 inhabitants must provide an evening high school, if there are fifty children over fourteen years of age desiring to attend; every town of 500 families must maintain a four years' high school for forty weeks each year; and every town of less than 500 families must either maintain such a school or provide free tuition in the high school of some neighboring town. Other cities and towns may provide such instruction, and any town may provide playgrounds, vacation schools, evening schools, evening lectures,

kindergartens, and instruction in agriculture, sewing, and cooking.

Each town school committee is to have full charge of the schools under its jurisdiction; must appoint a secretary; selects and examines teachers for the schools, but may accept Massachusetts state normal school diplomas in lieu of an examination; may dismiss teachers, as it deems best, and, after one year of service in the city or town, may employ them at its pleasure; may consolidate the schools and transport the pupils at public expense; must prescribe the course of study and the textbooks to be used and must furnish textbooks and supplies free to all pupils in all the schools; may supervise and control all athletic organizations in connection with the schools; and may employ a superintendent of schools. Two or more towns may unite to form a supervisory union and employ a superintendent, for one-year terms. If such a union raised \$750 above the average paid during the past three years for the salary of the superintendent, the state will grant an additional \$750 for the same purpose, and in addition \$500 to increase the salaries of the teachers within the union. Towns having a valuation of over \$2,500,000 cannot share in these benefits. Such unions must last at least three years, and at the time of formation the aggregate number of teachers should not be less than twenty-five nor more than fifty.

Every town must provide a sufficient number of schoolhouses, and for failure to do so a fine of from \$500 to \$1000 may be exacted; and if a town fails or refuses to raise money for the support of schools it may be fined twice the highest amount ever before raised for schools. Three fourths of such fines shall go to the town paying it, to be used for schools, while the remaining one fourth is to be forfeited to the county and to be used for county purposes. All teachers must keep a state school register, and the secretary of each school committee must make the proper returns, including a school census of all children five to fifteen years of age; and towns failing to report may be fined from 10 per cent to 100 per cent of their share in the school fund, or, if not entitled to a share of the school fund, may be fined \$200, the income from such fines to be added to the principal of the state school fund.

All schools must be kept equally open to all children, without reference to race, color, or religion. Vaccination must be insisted upon by the towns. Every city or town must appoint one or more physicians for medical inspection, and provide them with proper facilities for their work. Pupils, janitors, teachers, and buildings must be examined. In cities this may be done by the Board of Health. Sick children must be sent home, and both the parents and the Board of Health notified. Tests of sight and hearing must be made at least once each year, the State Board of Health prescribing the nature of the tests and

furnishing the material for the tests to the teachers.

The Massachusetts system of school management is peculiar among the states. Much is left to the towns, and little has been given to the central authority. Only within recent years has the state shown a tendency to increase the power of the central authority and to make prescriptions in its laws. The state oversight has been that of advice rather than direction, suggestion rather than compulsion. School legislation in Massachusetts has been characterized by an exceeding tenderness for the feelings of the towns, and the intense individuality of the towns and cities has been unduly considered and respected. As a result a diversity of practices is still retained, such as varying fiscal years, and different methods of calculating the cost of the schools, such as would not be permitted in any state west of the Alleghany Mountains. Nearly all progressive legislation has had to go through certain stages in its evolution. The first has been the permissive, or voluntary stage, marked by an adoption of the measure by the more progressive cities and towns, and a determined resistance to it by a residue of rather unyielding conservatism. Finally, after a long and rather slow process of education, the legislature has been induced to order the resisting towns to comply. This is in part made necessary by the peculiar methods of school support in use in the state. Not, for example, until all but forty-seven towns had voluntarily extended their schools to eight, nine, and ten months, did the legislature pass the eight-month school bill. Not until all but thirty-nine towns had voluntarily abandoned the district system, did the legislature finally abolish it. Educational progress in Massachusetts is a process of the education of the people; results are reached somewhat slowly, but they are likely to be permanent when finally attained.

School Support — The state school fund, created in 1834, has been slowly increased until it reached the sum of \$5,000,000 in 1908. In 1894, when the principal of the fund was \$3,770,548, the legislature directed that \$100,000 be added from the general treasury each year until the fund reached \$5,000,000. Being one of the original states, Massachusetts never received any school lands from Congress, and the Surplus Revenue of 1837 given to it was spent for general purposes by the state. The income from the present fund, which is about \$220,000 at present each year, is distributed only to the smaller and poorer towns, all towns having an assessed valuation of over \$2,500,000 being deprived of any share in the fund. The basis of distribution is a combined and a sliding one, varying with both the assessed wealth of the town and the percentage of the town's taxes spent for schools. The state also makes certain small appropriations for superintendents' salaries (mentioned above), and

for high school tuition and teachers' institutes. All of these, together with the income from the state school fund, constitute 2.18 per cent of the total expense for education in the state. Certain local funds, tuition charges, and gifts constituted 3.43 per cent more, and the remainder, 94.39 per cent, comes from local taxation. In the cities and the larger towns, the entire income for schools comes from local taxation alone. Massachusetts stands almost alone in this particular, and the burden of local taxation and the resulting school facilities provided exhibit very great inequalities. What some towns can provide with ease, others can provide only with the greatest effort, and still others cannot provide at all and never will be able to provide.

The total amount expended for education during the last year for which reports are available (1910) was approximately \$20,000,000. Based on the total population of the state, this was equal to a per capita expenditure of about \$6 a year as against \$5.54 for the North Atlantic division, and \$4.27 for the country as a whole.

Educational Conditions. — Of the population of 1910, 98.8 per cent were white, and but 1.2 per cent colored; 69.8 per cent were native born, and 30.2 per cent foreign born; 22.2 per cent were estimated as being between the ages of five and eighteen; and but 48.7 per cent were males. While the population averaged over the state is dense (418.8 per square mile), many towns have but a small population. Only 7.2 per cent of the total population live in country districts, and 80 per cent live in cities of 8000 or over. The state is essentially a commercial and a manufacturing state, with many important manufacturing towns.

In material conditions the schools of the state make an excellent showing. Most of the city school buildings are among the best of their kind, and the average value of all the school buildings of the state was a little over \$15,000 in 1910. Of the total expenditures each year for education, only about 60 per cent is spent for salaries, about 21 per cent being spent for new and better school buildings.

In instruction the schools offer much that is commendable. Manual training is taught in all but the smaller towns. Domestic science is to be found in the curriculum of most of the cities and many of the towns. Agricultural instruction is offered in a few places. Drawing, long a required subject, has been carefully supervised by the state since 1871, and excellent work has been done in the subject. Text-books and supplies are furnished free in all schools. Medical inspection is general. Kindergartens, evening high schools, evening drawing and technical schools, public playgrounds, and vacation schools are maintained by the larger cities and towns. A few industrial schools have also been established recently.

The state presents many educational inequalities.

ities, due to the great inequalities of the towns in taxing power. In some of the smaller and poorer towns the schools naturally are far below the standard of the schools elsewhere in the state, and below what schools anywhere ought to be. As some of the towns are steadily growing poorer while the cost of education is constantly increasing, this will always be so so long as the state insists on each town carrying so largely the burden of local support. While the enlarged school fund has been of much service to the poor towns, there is still need of further aid looking toward a much greater equalization of the burdens and the advantages of education. As it is to-day, good schools not infrequently go with the lighter tax and poor schools with the heavier tax.

The average length of term provided in Massachusetts was 170 days in 1910, and in but a very few cases fell below 160 days. The larger towns and cities provide approximately 200 days of school. In the matter of school attendance the state is very strict. Every child seven to fourteen years of age, and every child under sixteen years of age who cannot read and write, must attend some school, taught in the English language, every day it is in session. If the child is absent five days in six months, without proper excuse, parents may be fined \$20. A private school may be approved for attendance only if it teaches all of the required studies and in the English language, and if the school committee is satisfied that it is as thorough and efficient as the public school. The bad physical condition of the child is not accepted as an excuse, unless efforts are being made or have been made to cure the child. Every town and city must appoint truant officers, though two or more towns may unite in making such an appointment. These officers may apprehend children without a warrant, and take them to school. Each county, either by itself or in union with another county, is required to maintain a County Training (Truant) School, for the confinement of habitual truants, absentees, and school offenders. Vicious inmates may be sent to the Lyman School for boys, if under fifteen, or to the Massachusetts Reformatory for boys, if over fifteen. Girls may be sent to the State Industrial School for Girls. Parents, if able, may be compelled to pay for the support of such children while in the schools.

The state is equally vigilant in the matter of child labor. No child under fourteen can be employed in any kind of labor during the hours that the public schools are in session, nor at other times before 6 A.M. or after 7 P.M. Saturday work in mercantile establishments is allowed. No child under sixteen can be employed without a work certificate, to be issued by the school authorities, and only to the proper persons. To be eligible, all such persons under the age of sixteen must be able to read and

write the English language, the standard for this test being that of admission to the fourth grade of the public schools. Every factory employing such children must keep the work certificates on file and keep a list of such children posted in the factory. Factory inspectors and truant officers are to seek out all cases of illegal employment and good fines are inflicted for violation of the law. All illiterate minors over sixteen must attend evening schools, and a record of attendance must be filed each week with the employer. Towns may license bootblacks and other occupations in which minors engage, and may control the admission of children to places of amusement. These laws have been made necessary by the great influx of uneducated foreigners into the mill towns and manufacturing cities of the state. The illiteracy among the native whites was but 0.8 per cent in 1910; but among the foreign whites it was 14.6 per cent, while for the state as a whole the average was 5.9 per cent.

The development of the private and parochial school in Massachusetts has been one of the marked features of the school work of the state during recent years. Nowhere are the parochial schools better organized or stronger than in southern New England, and the Roman Catholic Church has there made a strong effort to gather the children of the foreign immigrants into its parochial schools, so long as it is able to provide for them. The fact that Massachusetts has better attendance laws than most states, and insists upon all schools being taught in the English language, and upon private schools being as good as public schools, is largely because of this condition.

Teachers and Training — The state employed 15,278 teachers in 1910, 92.3 per cent of whom were women. Of this number, 13.7 per cent were graduates of colleges, and 50.4 per cent were graduates of normal schools. Of the total number of teachers employed, 14.3 per cent were in high schools, and 9.7 per cent in evening schools.

The certification of teachers is still in the hands of the town school committees, except that the legislature of 1911 provided for the certification of teachers in state-aided high schools by the State Board of Education. In the larger cities and in some of the towns, this is done in a very satisfactory manner, in many towns it is done only indifferently, and, in a few towns, according to reports made in recent years, the examination of teachers is conducted in a very perfunctory manner or neglected entirely. The law demands that the school committee "shall require full and satisfactory evidence" of the moral character of teachers, and "shall ascertain, by personal examination, their qualifications for teaching and their capacity for the government of schools." Massachusetts normal school diplomas may be accepted in place of an examination. The law is so lax that the way is open for any form of

abuse, and no general certification standards are possible under it. Only in the larger cities and towns do any real standards exist. No other form of certificates are issued, except by the larger cities, and no provisions exist in the law for the recognition of any form of certification from outside the state.

The state maintains nine normal schools, as follows: Bridgewater, Fitchburg, Framingham (formerly at Lexington), Hyannis, Lowell, North Adams, Salem, Westfield (formerly at Barre), and Worcester. In addition, the state also maintains the Boston Normal Art School. The cities of Boston and Lowell also maintain city normal schools. All of these schools rest upon the high schools in the matter of admission requirements.

Secondary Education.—There were 230 public high schools in the state in 1910, employing 2210 teachers and enrolling about 55,000 students. Boston maintains fourteen day and six evening high schools, and Boston, Cambridge, and Springfield maintain technical high schools in addition to the regular type of high schools. Besides the public high schools, there were ninety-one private high schools employing 725 teachers and enrolling approximately 6400 students.

All cities and towns of 500 families are required to maintain a high school, and all towns of less than 500 families are required to provide high school tuition for their pupils in neighboring high schools. If the valuation of the town is less than \$750,000, the state reimburses the town for all of the tuition paid; and, if over \$750,000, the state pays one half. In 1910 the state granted aid to ninety-seven towns for 1114 pupils, at a total cost of \$38,808.43. If any town of less than 500 families maintains a high school, the state grants it \$500 in aid (forty-four towns in 1908). All high schools must have a four-year course, and be maintained forty weeks each year. Two adjacent towns, each having less than 500 families, may vote to unite to form a union high school.

The work done in the high schools of the state is of good grade, and the standards maintained by the Massachusetts colleges insure a good quality of work along traditional lines.

Higher and Technical Work.—The Massachusetts Agricultural College, at Amherst, opened in 1867, is the only institution of higher learning maintained by the state. It offers courses only in agriculture, and enrolls about 250 students, practically all men. There has been agitation in Massachusetts within recent years looking toward the establishment of a state university, but the large cost seems to be a strong factor against the plan. For some years the state has provided forty scholarships for boys in the Massachusetts Institute of Technology and a like number in the Worcester Polytechnic Institute, and an alternative proposition has been made to increase these. So great has been the demand for these scholarships that the state has for a number of years divided most of them into half scholarships, and the number has been increased recently. The legislature of 1911 voted \$100,000 annually for ten years to the Massachusetts Institute of Technology in return for free scholarships. Harvard University was originally founded by the colony, and for 150 years was, in part, supported by it, but it is no longer connected with the state. Until after the Revolution, money for the salaries of the faculty was voted annually by the General Court, and the election of president and professors was under its jurisdiction, and until 1865 the chief officers of the commonwealth were members of the governing board of the university. Since 1865 all connection with the state has been severed. The State Board of Education was instructed by the legislature in 1911 to consider the whole question of state-aided higher education, and to report its findings at a subsequent session.

The different institutions of higher learning in the state, not including strictly professional schools, are :—

INSTITUTION	LOCATION	OPENED	CONTROL	FOR
Harvard University . . .	Cambridge	1638	Nonsect.	Men
Williams College . . .	Williamstown	1793	Nonsect.	Men

Special Institutions.—The commonwealth provides for the education of children whose physical or mental defects forbid their attendance upon the public day schools, by giving the Governor power, on the recommendation of the State Board of Education, to place all such defective children in special institutions and to pay part or all of the expense of their maintenance and instruction. Such children are under the care of the State Board of Education until discharged. The institutions approved are:—

The American School for the Deaf, at Hartford, Connecticut.

*The Clark School for the Deaf, at Northampton.

The Horace Mann School for the Deaf, at Boston.

The Sarah Fuller Home for Little Deaf Children, at Medford

*The New England Industrial School for Deaf Mutes, at Beverly

The Boston School for the Deaf, at Randolph.

*The Perkins Institute and Massachusetts School for the Blind, at Boston.

*The Massachusetts School for the Feeble Minded, at Waltham

The Boston Nursery for Blind Babies, at Roxbury.

(Those prefixed by * are maintained by the state.)

The state also maintains an Industrial School for Girls, at Lancaster, the Lyman Industrial School for Boys, at Westboro, and a Reformatory School for Boys at Shirley. The state also assists in the maintenance of large and well equipped textile schools at New Bedford and Lowell, and the law creating the Industrial Commission in 1906 provided for state aid to any town or towns of from one fifth to one half of the total cost of maintenance for industrial schools for the instruction of children over fourteen years of age in the principles of agriculture and domestic and mechanical arts. The law also provides for a Board of Commissioners of three, to be appointed by the Governor, who are to maintain, from state appropriations, the Massachusetts Nautical Training School, to provide a ship and all necessary books and materials, and to arrange for a six months' cruise each year in or near Boston Bay.

MASSACHUSETTS TEACHER.—See JOURNALISM, EDUCATIONAL.

MASTER or MAGISTER—The word appears to mean nothing more than chief (Magister), and the original sense of the word appears to be best preserved in such phrases as "master-cook," "master-mason," and the like. Perhaps its earliest use is in the title of the *Magister equitum*, or "master of the horse," the chief of the cavalry, appointed by the Roman dictator as *magister populi*, or chief of the whole people. In this sense it was always used as it is used to-day.

But already in classical times it had acquired a special connotation as meaning schoolmaster or teacher. Cicero in the *De Oratore* not only speaks of masters *simpliciter*—to mean teachers of boys, but also uses the medieval sounding phrase "masters of the liberal arts." Juvenal uses *ludimagister* and *magister* as equivalent terms. In medieval times this became its general and almost exclusive use, and from this use it had developed into a title of honor, which has now become our universal "mister" so universal that there is no one probably to whom it is not applied, except to a criminal in the dock. Alcuin in his poem, c. 770, *On the Bishops and Saints of the Church of York*, in his catalogue of the Library speaks of "Beda magister," "Beda the master," or "Master Bede," as if it was as much his recognized title, derived from his office of teaching the young monks, as in later days the "Venerable Bede," became. Alcuin also describes his own master Albert as having been made proclaimed "master in the city," when he was made master of the school of York. It is probably from the date of the rise of universities at the end of the eleventh and the early part of the twelfth centuries, from c. 1090 and perhaps first in connection with the Doctor of Laws at Bologna that the term *Magister* becomes used as a regular title; *Magister Inerius*, *Magister Abelardus*. It then became restricted, and from being used of any who taught school came to mean one who had taught school at one of the *Studia generalia*, a regent master of the schools of a university. At Bologna, however, the title "master," which was exactly equivalent to "doctor" or teacher,—Alcuin describes Egbert of York when teaching the school as *Egregius doctor*,—was dropped in the faculty of law for that of doctor. At Paris and Oxford, too, the title of "doctor," began to be more usually restricted to the theological masters, and at Salerno and elsewhere to the medical

masters, by whom it has now in common parlance been almost entirely annexed. But in theory always there was no distinction, and the Master of Arts was the teacher and held the highest degree in his faculty as much as the Doctor of Theology in his. But as it became usual and eventually necessary to take the course in arts and become a regent master of arts before passing on to the faculty of theology, which was the mistress of all the sciences, it came about that in later days doctor was esteemed as a higher title.

Perhaps the most curious thing about it was that the title of *magister* among the ecclesiastics completely eclipsed the title of *dominus*, or lord, so that eventually those who had not "risen to the height of the mastership," but had stopped short as bachelors, — at first a kind of pupil teachers, a sort of apprentices in the arts and the art of teaching, — became known as *Domini* in distinction from those who had become regent masters; and shared the title with the "inferior clergy" who had never been to the University at all, and the lay lords of manors and of Parliament. The height of the title of master was perhaps reached when it was bestowed upon the simple layman, Thomas Cromwell, when he was Privy Seal, and "Prime Minister" in the State and wielded, as Vicar-General of Henry VIII, papal powers in the Church, in contrast with William of Wykeham, who, when he occupied a similar position under Edward III, is called by Froissart simply "*Dominus*," "Sir Wiccan." Its gradual spread to every one of any position at all was due to the rise of the middle classes and the increase in the numbers of the peerage, to the invention of the order of baronets by James I, and the increase of the knighthood. A. F. L.

The general usage was transferred to the American colonies, where the term was applied to both Latin grammar and elementary school teachers, the former at first termed masters and the latter school masters, though the distinction was not clear nor the usage fixed.

See DEGREES; TEACHING AS A PROFESSION; UNIVERSITIES.

MATERIALISM. — The theory that matter is the sole ultimate existence, and that all mental phenomena are in reality effects of matter, so that, if our knowledge of matter were complete, we could deduce from its laws and conditions so-called mental phenomena with the same certainty as phenomena of heat or electricity. The atomic school of antiquity represented by Democritus and Leucippus is generally regarded as the founder of philosophic materialism. These tenets were taken up by the Epicureans and find a classic expression in the *De Rerum Natura* of Lucretius. The atheistic character of this school brought materialism into ill repute, and among the many heresies of the Middle Ages few were frankly materialistic in character. The Epicureans, however, de-

fended the liberty of the will, as they found it necessary to introduce chance and spontaneous variation of direction of motion into matter. Some of the modern materialists have been strong theists, as Joseph Priestley (*q.v.*).

The modern interest in the problem of knowledge and in consciousness (see IDEALISM) has tended to reduce the importance of materialism, if not actually to eliminate it. The objective idealist has claimed that "matter" itself is ultimately but a "category" of thought or spirit in its determination of an objectively knowable world. Subjective idealists have claimed that conscious facts are the only ones directly known, and that "matter" is at most but a dubious inference from mental phenomena. Others have claimed that the principles of the conservation of energy contradict materialism, since the circuit of transformations of energy is complete on the physical side alone. The seeming dependence of mental phenomena upon brain changes is in reality but the concomitance of two independent series — a doctrine that under the name of Parallelism (*q.v.*), has given a turn to the Leibnitzian conception of Preestablished Harmony which has been very popular. Others, like Spencer and Huxley, have held that from one point of view mental phenomena are resolvable into physical; from another, physical into mental. Hence, the conclusion that both series are but symbolic manifestations of some ultimate unknown and unknowable reality. Even those writers, who, like Haeckel, have more openly maintained a materialistic monism, have generally endowed "matter" with some primitive inchoate psychical impulses and feelings and have thus approximated pansychism or the doctrine that the world and mind are both arrangements of a more basic "mind stuff." • **MATERNITY.** — See PARENTHOOD, EDUCATION FOR.

MATHEMATICS. — Attempts to define so broad a subject as mathematics have not been very successful. Benjamin Peirce, one of the best of the American-trained mathematicians, said that "mathematics is the science that draws necessary conclusions." Such a definition trespasses upon the domain of logic; but there are many who would relate logic and mathematics, as sciences, more closely than is commonly done. Professor Bôcher has suggested a basis of definition: "We may seek some hidden resemblance in the various objects of mathematical investigation, and, having found an aspect common to them all, we may fix on this as the one true object of mathematical study. Or we may abandon the attempt to characterize mathematics by means of its *objects of study*, and seek in its *methods*

its distinguishing characteristic. Finally there is the possibility of combining these two points of view." When, however, we attempt to define the science with respect to its objects, we are confronted by so many difficulties that there seems but little hope of success. There seems more chance of favorable results in attempting to define the science by means of methods, and numerous efforts in this direction have been made. Professor J. W. Young has recently suggested the defining of "abstract mathematical system" as a system of symbols devoid of content except such as is implied in the assumptions concerning them, and then saying that "mathematics as a whole might then be defined as consisting of all such abstract mathematical systems together with all their concrete applications." These attempts at defining the science serve at least to show the broadening of the subject from century to century.

With this broadening of the science itself has come not merely the difficulty of definition, but also the difficulty of stating in concise terms the certain reasons for studying the subject. We may set forth certain reasons for studying this phase or that, but for studying a science that is so broad that we can hardly define it, and so far-reaching in its applications, it is manifestly well-nigh impossible.

In the elementary portions of the general field it is possible to assign some reasons for studying the science. Among these, utility stands out prominently, and indeed there are few parts of mathematics that have not very definite applications to some other line of science or to some of the arts. Not only is there the definite application of the present to be considered, but there is potential application. No one thought when complex numbers were first suggested that they would in our day play a part in the theory of electricity, for example; nor did the Egyptians and Greeks see in their shadow reckoning the forerunner of the trigonometry that uses the slide rule and logarithms in its computations, as at present. Certain of the reasons for the study of mathematics are set forth under the various branches considered in this work.

There is no well-defined basis for the satisfactory classification of the branches of mathematics. Indeed, the modern tendency is toward the uniting of these branches rather than their differentiation. In elementary mathematics this tendency shows itself in the use of the simple equation and the introduction of mensuration in arithmetic; in the use of the facts of mensuration thus learned in algebra; in the use of algebra in the elementary course in geometry; and in the use of both algebra and geometry to a greater extent than formerly in trigonometry. Many would like to see the union of elementary mathematics made still more close, and it is probable that the interrelation of algebra and geometry will become more and more pronounced.

D. E. S.

For a further study of the subject see the articles on the various branches of mathematics, including ALGEBRA, ANALYTIC GEOMETRY, ARITHMETIC, CALCULUS, ELEMENTARY MATHEMATICS, FUNCTION, GEOMETRY, TRIGONOMETRY.

MATHEMATICS, HISTORY OF. — See ALGEBRA; ANALYTIC GEOMETRY; ARITHMETIC; CALCULUS, COMPUTUS; CONICS; FRACTIONS; GEOMETRY; NOTATION; PROJECTIVE GEOMETRY; TRIGONOMETRY.

MATHEMATICS, LABORATORY METHODS IN. — At various times it has been sought to present elementary mathematics somewhat after the laboratory method of the natural and physical sciences. The movement has been fostered by those who see in algebra and geometry a powerful adjunct to physics, as well as by those who wish to make mathematics as concrete as possible. Within reasonable limits the spirit of such a movement is one that is approved by many teachers. Whenever it is possible to show the concrete applications of mathematics in such a way that the interest aroused thereby outweighs the loss in the theory that is occasioned by the time expended, the result is salutary. There have, however, been extremists who have abused the spirit of the movement, and have gone to the laboratory to illustrate, by tedious means, principles that are substantially axiomatic to the normal mind, thus sacrificing valuable time and even dulling the interest. This is seen in the laborious devices often employed for explaining the axioms of algebra, when a ruler balanced on a book answers the purposes much better. It is also seen in the great expenditure of time sometimes involved in graphic work that has little bearing upon the subject in hand, and particularly in the tendency that is sometimes observed to turn the class in mathematics into one in mechanics or general physics.

The result of the efforts has been valuable in the industrial schools, where the aim is not mathematics as a science, but the study of the relatively few types of application that are needed in the lower lines of mechanical work. Here the laboratory, with its practical measurements, its making of working drawings, and its use of such instruments as the slide rule, has a definite place. In the non-technical high school the spirit of the laboratory may profitably show itself in the use of concrete illustrations whenever such use elucidates the mathematical processes, and in making the subject as real as possible. But to devote any considerable amount of time to this effort has not, in general, been thought wise. There is a large field of pure mathematics that is and should be developed for its own sake, just as literature is developed, and it would be unfortunate to neglect this for the benefit of those who are abnormally unable to appreciate it.

The equipment for laboratory work includes drawing boards and instruments for graphic illustration and for the making of working drawings; the slide rule, logarithmic tables, and, if possible, one of the more elaborate forms of computing machines; measuring instruments, including calipers, scales for weight, diagonal scales, steel tapes, and units of capacity, in both the common and metric systems; sets of geometric solids; a transit and surveying rods; a blackboard ruled for co-ordinate graphs; a spherical blackboard, and similar material. Indeed, a considerable amount of this material should find place in every high school, even where the narrow type of laboratory work is introduced. D. E. S.

MATHER, INCREASE (1639-1723).—Sixth president of Harvard College. He was graduated from Harvard in 1656, and subsequently studied at Trinity College, Dublin, where he took his A.M. degree in 1658. Returning to America in 1661 he became pastor of a church in Boston. He became a stirring figure in the life of the colony, opposed the aggressions of King Charles II, and in 1688 was sent to England to procure redress of the grievances of the colony. He was acting president of Harvard in 1681 (after the death of President Oakes), but he declined at that time to become the permanent head of the institution. He succeeded President Rogers as president of Harvard on June 11, 1685, and held the post until Sept. 6, 1701. Through his efforts the college was authorized to create bachelors and doctors of theology. "As president he was careful not only to give the students direction in their literary pursuits, but also to impart to them religious instruction. He frequently called them one by one into the library, and there, with the affection of a parent and the fidelity of a minister of the gospel, he would confer with them respecting the salvation of their souls." It was largely through the efforts of Mather that the Presbyterian and Congregationalist bodies in New England were united. His writings include a history of the troubles of the English settlers with the Indians, and numerous religious works. W. S. M.

See HARVARD UNIVERSITY.

MATHEWS, JAMES MACFARLANE (1785-1870).—First chancellor of New York University. He was graduated from Union College in 1803, engaged in the work of the ministry, and was one of the leaders in the organization of New York University (then University of the City of New York) and its first president (1830-1838). He was the author of works on religion and travel. W. S. M.

MATURITY TESTS.—The difference between a child's general physiological development and his mental development has been emphasized by calling attention to the fact

that the child's mental age may be different from his physiological age. In an extreme case an imbecile may be twelve years of age and yet have the mental development of a child of two years of age. In order to ascertain the degree of mental maturity which a child has attained, series of tests may be applied to discover his relative ability in visual recognition, in language, in imagination, in power to deal with numbers, etc. C. H. J.

See GROWTH; TESTS, PSYCHOPHYSICAL.

MAUGER, CLAUDIUS (fl. 1650).—Teacher of French in London, a native of Blois, who had left France on account of religious persecution. He was apparently a teacher in France before he came to England, and obtained a living in London by private and school teaching, particularly in the girls' school of Mrs. Margaret Kelvert. In 1652 he published the *True Advancement of the French Tongue*, and in 1656 he issued the second edition of a *French Grammar*, in which a Latin as well as an English version is given, that points to the probability that the first edition was a French-Latin work published in France with the English added for the second edition as published in London.

See MODERN LANGUAGES IN THE SCHOOLS.

MAURICE, JOHN FREDERICK DENISON (1805-1872).—Divine and educational reformer; born at Normanston, near Lowestoft, England, the fifth child of Michael Maurice, who at the time of his son's birth was educating private pupils at Normanston Manor House. Frederick was educated by his father in Puritan principles. He was a precocious child. Intended by his father for the Unitarian ministry, he revolted against Unitarianism and the narrow outlook of English nonconformist circles in his time. With a view to becoming a barrister he entered Trinity College, Cambridge, in 1823, that university being chosen as it imposed no religious test upon students at matriculation. At Cambridge, Maurice was one of the founders of the Apostles' Club, and became an intimate friend of John Sterling. While still at Cambridge he was coeditor of the *Metropolitan Quarterly Magazine*, in which he declared his admiration for Coleridge and attacked Bentham. In 1828 he joined the debating society founded by John Stuart Mill, MacCulloch, Charles Austin, Romilly, and others, and is mentioned by J. S. Mill (*Autobiography*, p. 128) as a Coleridgean, and, with Sterling, representative of "a second Liberal, and even Radical, Party, on totally different grounds from Benthamism and vehemently opposed to it, bringing into these discussions the general doctrines and modes of thought of the European reaction against the philosophy of the eighteenth century." This became Maurice's habitual standpoint. He was opposed both to the Benthamites and to the Tories. For a short period he was editor of the *Athe-*

num. His mind gradually turned toward taking holy orders, and he resolved to go to Oxford, where he entered Exeter College in 1830. In 1831 he entered the Church of England. After a curacy near Leamington he became, in 1836, chaplain to Guy's Hospital, giving lectures to the students on moral philosophy twice a week. In 1837 he married the sister of Sterling's wife. In 1839 he became editor of the *Educational Magazine*, and delivered a course of lectures on the subject, *Has the State or the Church Power to educate the Nation?* In these lectures he protested against the theory that the secular State should take over the whole of national education out of the hands of the religious bodies. In 1840 Maurice was appointed Professor of English Literature and History at King's College, London, and in 1846, one of the professors in the theological department of the college and also chaplain of Lincoln's Inn. Among his congregation at the latter were Thomas Hughes (*q.v.*), J. M. Ludlow, and the nucleus of the Christian Socialist Party. They and Charles Kingsley (*q.v.*) became the devoted friends of Maurice. In 1844 he founded Queen's College, the first of the collegiate institutions in England for the higher education of women. He had been led to take an interest in this subject by the experience of his sister, Mary, who had established a school at Southampton. The profound movement in political and economic thought which stirred England and Europe from 1842 onwards led to the establishment (first in Sheffield, 1842) of people's colleges formed by the voluntary effort of workmen students for self-improvement and instruction. The idea of the Sheffield People's College suggested to F. D. Maurice and his friends in 1853 the foundation of a similar institution in London, and this led to the establishment of the Working Men's College, the most famous and influential of all efforts to promote the higher education of working people. The founders of this college laid stress upon the need for brotherliness and fellowship in all higher education, upon the fact that in its true form such education is mutual education and that teachers and taught must meet as human beings, with full confidence in one another and without reserve. The first of the fundamental principles of the college ran as follows: "Our position as members of a society which affirms the operation of trade and industry to be under a moral law (a law concerning the relations of men to each other) obliges us to regard social, political, and human studies as the primary part of our education." The teaching staff of the Working Men's College included Ruskin, F. J. Furnivall, T. Hughes, Professor Westlake, Dante Gabriel Rossetti, Lowes Dickinson, E. Vansittart Neale, Grant Duff, Thomas Woolner, Charles Kingsley, Ford Madox Brown, Frederic Harrison, and Edward Bowen. The lectures which introduced the idea of the Working Men's College

to the British public were subsequently published in 1855 by F. D. Maurice, under the title *Learning and Working*.

In 1853 a bitter theological controversy had severed Maurice's connection with King's College. In 1860 he was appointed to the charge of St. Peter's Chapel, Vere Street, London, and as a preacher had great influence on the most thoughtful men and women of his time. He died April 1, 1872, and is buried at Highgate.

Maurice is one of the most revered figures in the intellectual and spiritual life of England during the Victorian era. As to the validity and permanent significance of his contributions to the intellectual thought of his time opinions have always varied. A large circle found guidance in his teaching, ranking him with S. T. Coleridge among English thinkers. Frederic Harrison, on the other hand, and others inclining to the Positivist standpoint, speak of him as muddle-headed (see Frederic Harrison, *Autobiographic Memoirs*, 1911). From the educational point of view, Maurice's personal influence was of historic importance. He and his friends were the first to touch the older English universities with a sense of direct personal responsibility for the adult education of the working classes. M. E. S.

MAURITIUS, EDUCATION IN — The small island of Mauritius has been under British control for a century, having been acquired by conquest in 1810 and formally ceded to that power by the Treaty of Paris, 1814. The island, which has an area of 705 square miles, supports a population of 378,000; of this number two thirds are natives of African origin, Chinese, mixed peoples, and white settlers. In religion, according to the census of 1901, 206,000 were Hindus, and above 40,000 Mohammedans. The Roman Catholic Church claimed 113,224 and the Protestants, 6644. A dual system of free schools, government and denominational, is maintained, both aided from the public treasury. In the government schools 8634 pupils were enrolled in 1909, with an average attendance of 5433. In the state-aided denominational schools the enrollment was 10,631, and average attendance, 7234. Secondary and higher education are provided by the Royal College and its affiliated schools. The total government expenditure for education in 1909 was £40,394 (\$196,315). A. T. S.

ELTON. *Literary Remains and Memoir of Dr. Maxcy* (1844.)

MAXIMUS PLEANDES.—A celebrated scholar and writer who lived in the fourteenth century. He was a Greek monk, and spent the greater part of his life at Constantinople, where he pursued the study of theology, rhetoric, history, mathematics, and poetry. Little is known of his history except that he was sent as an ambassador to Venice, and that he was still living in 1352. Numerous works of his are extant, one of the most important being a work on arithmetic, based on the Hindu numerals.

D. E. S.

MAY, SAMUEL JOSEPH (1797-1871).—Normal school principal. Graduating from Harvard College in 1817, he taught for many years in the schools of Massachusetts. He was principal of the Framingham (Mass.) State Normal School (1842-1845), and was active in the American Institute of Instruction (*q.v.*). His educational writings include *Education of the Faculties*, *Revival of Education*, and numerous articles in educational journals.

W. S. M.

MAYNOOTH UNIVERSITY, DUBLIN.—

See IRELAND, EDUCATION IN.

MAYO, AMORY DWIGHT (1823-1907).—Educational author. He studied at Deerfield Academy and Amherst College. After teaching in the public schools of Massachusetts for five years, he entered the ministry, and for twenty-five years was pastor of Universalist and Unitarian churches, and for several years lecturer at the Meadville Theological School. He led the so-called Christian amendment movement which sought to incorporate in the constitution of the United States the right to use the Bible in the public schools. From 1880 to 1885 he was one of the associate editors of the *New England Journal of Education*, and during his closing years was engaged by the Bureau of Education of the United States in the study of educational problems. His published writings include *Religion in the Common Schools* (1869), *Industrial Education in the*

South (1885), and a series of articles on the history of American common schools, published in the annual *Reports of the Commissioner of Education of the United States*. W. S. M.

MAYO, CHARLES (1792-1846).—English educator, born in London and educated at Merchant Taylors' School and St John's College, Oxford, where he graduated in 1814. He was ordained in 1817, when already headmaster of the grammar school at Bridgnorth, Shropshire. In 1819, whether it was through the influence of Mr. Synge of Glanmore Castle, Wicklow, or whether he was persuaded by friends to take charge of some English boys at Yverdon, he joined Pestalozzi's establishment as its chaplain. Here he remained until 1822, when he returned to England and opened a school on Pestalozzian principles at Epsom; soon after (1826) he removed to Cheam. His work was strongly imbued with an intense moral and religious purpose. He met with great success, and intending pupils were placed on the waiting list years before they could be admitted. Hermann Krusi, Jr., taught here for a time. Through Mr. J. S. Reynolds, Mayo and his sister helped to found the Home and Colonial School Society (*q.v.*) and the training college for teachers connected with it. Mayo's great service to English education was to call attention to the Pestalozzian principles, although in introducing them generally to the schools he diverged widely from their spirit by formalizing them in model lessons and textbooks. He lectured on Pestalozzi before the Royal Institution in 1820 and collaborated with his sister in several schoolbooks and a memoir on Pestalozzi. Among his works may be mentioned *Observations on the Establishment and Direction of Infant Schools* (1827); *Practical Remarks on Early Education* (1837), frequently reprinted by the Home and Colonial School Society; a lecture on Pestalozzi's life prefixed to Miss Mayo's *Pestalozzi and his Principles*.

MAYO, ELIZABETH (1793-1865).—English Pestalozzian, sister of Charles Mayo, whom she assisted from 1822 to 1834. In 1843 she became associated with the work of the Home and Colonial Society (*q.v.*), and had charge of the criticism and professional training at the society's training college, duties which she exercised with great skill. She collaborated with her brother in several Pestalozzian textbooks, which formalized and in a large measure stultified the spirit of the work. Her own works enjoyed great popularity, and include: *Lessons on Objects* (1831); *Lessons on Shells* (1832); *Lessons on Scripture Prints* (1840);

On Religious Instruction (1849); *Model Lessons for Infant Schools* (1848-1850).

MEAN. — See STATISTICAL METHOD.

MEANING. — This term has come into common use in psychology to refer to that phase of experience which goes beyond the impression. Thus, as one looks at a word, the impression consists of certain black and white spaces. The word, however, calls up a whole series of ideas which give meaning to the impression. The meaning which attaches to an experience may be more or less complex. Thus the meaning which the student of constitutional history attaches to the date 1776 and the meaning which a child in the elementary school attaches to the same date will differ vastly in complexity.

The term "meaning" serves one very important function in psychological discussions. It draws attention to the fact that the additions which we make to impressions are not commonly in the form of full explicit memory images. Thus, the first time that the child learns the meaning of the word "dog" he sees the animal, thus adding a visual image to the sound. The second time he may call up an image of the dog, or he may see a second animal to add to his interpreting experience. The third and fourth times his experience continues to develop, until finally the word "dog" has a very full significance. Psychological analysis of this last stage reveals the fact that the meaning added to the word is not a mere series of reproductions of that which the child saw the first, second, third, and subsequent times. It is rather an epitomized and thoroughly assimilated residuum of all that has gone before. It may contain very little visual imagery. It may be for the most part a thrill of friendly emotion with a vague visual or tactual image. In any case, the meaning is a digest of the experiences rather than a train of images.

Teachers who insist on too much memory work will find a corrective for their methods in a careful study of the psychology of meanings.

MEASLES. — Measles is a highly contagious disease due, probably, to a bacillus hemophilus similar to Pfeiffer's influenza bacillus. This bacillus is frequently found in the secretions of the conjunctiva, the nose, and the respiratory tract.

The initial symptoms are similar to those of a cold, and the characteristic symptoms are an eruption of small red spots especially on the

forehead and the back of the neck, and in most cases a white spot, the so-called Koplik spot, on the mucous membrane of the inner surface of the mouth or on the conjunctiva. The disease usually remains at its height for a day or two and then gradually subsides, and, if there are no complications, in a fortnight or less, the patient has usually recovered. In many cases, however, serious complications, especially bronchitis, pneumonia, or tuberculosis, result. The period of incubation is from eight to sixteen days, sometimes still longer, and the patient may be a source of infection for other children three days before the disease can be diagnosed by ordinary methods. It is spread chiefly if not entirely by personal contact, apparently seldom if ever carried by a well person; only rarely does an individual have the disease twice. The eruption is probably due to the formation of antibodies in the organism to combat with the disease, a view in harmony with the popular idea that a generous breaking out is a good symptom.

In regard to the disease many erroneous ideas are prevalent. It is not ordinarily considered a serious disease; it is supposed that every one must have it, and apparently many think that the sooner a child has it, the better; and even physicians are apt to think it is uncontrollable. On the contrary, measles is often a fatal disease with young children. It is especially serious for weak and anæmic children, those who have latent tuberculosis, and those who have a tendency to certain diseases, such as disease of the ear, the heart, and the respiratory organs. According to Dr. Kerr, under whose supervision the extensive London investigations have been made, "measles is the most fatal disease of childhood and the one that plays the most havoc with school attendance" (Kerr. *Report of the Medical Officer*, London, 1905, p. 30). While not as serious in this country as in England, investigations in many countries have shown the great mortality where the disease occurs in the early years before the age of six. The total number of deaths from measles in the registration area covered by the U. S. Census for the year 1908 was 4611. In Prussia for the year 1906 it was 9107, and it is estimated that every year there are about 15,000 deaths from this disease in the United Kingdom.

The aim of hygiene is to postpone the disease to as late an age as possible. It should be kept out of the kindergarten at whatever cost to school work. The postponement of the disease even to the elementary grades means that a smaller number of children will have it at an early age. And the aim is also to make the time between epidemics as long as possible; for this again means that fewer young children will have the disease. In the view of some it is an uncontrollable disease, and thus we had better allow it to exist in chronic form than try to combat it and have periodic epidemics.

MEASLES

Modern studies, however, indicate that in the school at least it can be in large measure controlled.

The scientific method of managing measles based upon the facts just mentioned consists of four things: first, a complete registry of all cases kept by the board of health, so that as soon as a case occurs in any school it will be possible to see just how many of the children have already had the disease. Second, in case of a kindergarten or primary class where a considerable part of the children are susceptible, closure of the class when measles becomes epidemic in the city, whether a case has occurred in this particular kindergarten or not, or else notification of all parents warning them to watch their children carefully in case of colds or the like. Third, whenever a case of measles appears in a class, exclusion of all children of the same family who have not had the disease; and, eight days after the first case appears in any class, exclusion of those susceptible for a period of eight days so that the second crop of cases will occur while the children are at home, together with notification of all parents to watch their children. Fourth, careful instructions of both parents and teachers in regard to necessary precautions.

The great difficulty in treating measles is that of detecting the first case at a sufficiently early period to prevent infection. The success, however, of Dr Eberstaller's method, and the probability that an earlier diagnosis of the disease will soon be possible, give good hope that soon it may be controlled at least to such an extent that it can be kept out of the kindergarten and the primary grades. The Koplic spots, although not present in all cases, are a sign of measles; and this often renders possible an earlier diagnosis than the general symptoms. Moreover, recent studies by Hecker show that there are important changes in the blood which perhaps will soon permit a diagnosis of the disease several days earlier than has hitherto been possible. Probably before the community is educated to the proper care as regards measles, it will be quite possible to diagnose the disease at the time when it first becomes contagious.

Children who have measles should be kept out of school for a period of three or four weeks, and brothers or sisters who have not had the disease should be excluded from school; but the consensus of the best authorities seems to be that it is an unnecessary and wasteful precaution to exclude other members of the family who have already had the disease. Frequently a great injustice is done in the higher classes by such unnecessary exclusion. School closure on account of measles is apt to occur after it becomes unnecessary and useless; for the children have been exposed to the disease, and the only good of closure is to appease the alarm of excited parents. Closure to be effective must occur when the first case occurs.

MECHANICAL CALCULATION

Whenever a case of measles appears, whether the school be closed or not, parents of unprotected children should be notified.

The general adoption of a scientific method of managing measles would probably result in the saving of many lives, much chronic illness, and great interference with school work.

MECHANIC ARTS SCHOOLS. — A term of indefinite connotation, applied occasionally to institutions of technical or industrial education of higher or secondary grade. Its widest use was in the Morrill Act of 1862. For these institutions see **AGRICULTURAL EDUCATION**; **TECHNICAL EDUCATION**. It is also occasionally applied to Manual Training High Schools. See **MANUAL TRAINING**.

MECHANICAL CALCULATION. — The methods of calculation by means of the Hindu-Arabic numerals taught in our schools to-day are comparatively modern, and are not as generally used throughout the world as is often supposed. Up to the sixteenth century calculations were performed mechanically by all peoples on some form of the abacus (q.v.); this was due to the fact that our present system of Hindu-Arabic numerals with its symbol for zero and the important feature known as *place value* had not been developed until this period.

Our present methods of written computation were not possible earlier, for they depend upon a more perfect notation than the Roman, such, for example, as the Hindu-Arabic. This situation is readily appreciated when one attempts to add a column of figures expressed in the Roman notation. The Romans never used their numerals for calculation, but merely to record results obtained mechanically on the abacus.

Though the sixteenth century developed this new method of computation, the majority of people continued to compute mechanically, and even to-day Japan, China, Russia, and a number of smaller countries do all computing on the *suanpan* or *soroban*, or on some similar form of abacus. In the banks in any of these countries one is surprised to find exchange computed as rapidly and accurately on these little counting frames as it would be by an expert accountant in this country.

During the last twenty-five years a part of the civilized world is rapidly returning to mechanical calculation, substituting for the abacus the modern calculating machine. This new development has gone so far in the United States that most large accounting rooms and banks are now using from one to two hundred such machines, and in some of the larger department stores all of the bookkeeping is done by machinery. Even the familiar cash register seen everywhere in small as well as large shops is, in addition to a money drawer, an adding machine which automatically adds the sales as they are made and gives a grand total at the end of the day.

Modern calculating machinery is divided into two large classes: (1) adding machines, and (2) multiplying and dividing machines. Adding machines are usually operated by keys like a typewriter; some of them, like the Burroughs Adding Machine, print each item added, while others, like the Comptometer, give only the results without printing. The latest development is a combination of the adding machine and the typewriter, an arrangement which makes possible a complete system of mechanical bookkeeping. The Elliott-Fisher is a representative machine of this type. All the machines above mentioned are used very extensively in banks and business houses.

Multiplying and dividing machines are divided into two classes: (1) those which multiply by continued addition, and (2) those which multiply directly. The former machine is the simpler and was originally conceived in 1668 by Leibnitz, the great mathematician. In its modern form it is known as the Thomas Arithmometer. The Unitas, the Brunsigma, and the Triumphator are other modern machines of this type. Of the machines which multiply directly the Millionaire is a representative. On all these machines, which are operated by hand or electricity, long multiplications and divisions are performed with absolute accuracy

in a few seconds. These machines are extensively used by insurance companies and large manufacturing companies.

For approximate calculation a simple mechanical device known as the *slide rule* is much used by engineers. It consists of two strips of wood, each about ten inches long, which slide on each other and which are marked with a graphic logarithmic scale, thus making it possible to perform mechanically simple multiplications and divisions, as well as to find powers and roots.

The use of modern calculating machinery is rapidly extending, and will in all probability have some slight influence on the future teaching of arithmetic. Although the machine will never do away with the teaching of this subject, it will put a premium upon accuracy and will lessen the necessity of teaching rapid calculation.

MECHANICAL ENGINEERING. — See TECHNICAL EDUCATION.

MECHANICS' INSTITUTES. — **England.** — Associations of artisans and workmen which sprang up under the rising influence and importance of the industrial occupations at the end of the eighteenth and the beginning of the nineteenth century. Their aim was mutual improvement and study of the sciences as they applied to industries at a time when school facilities were practically nonexistent for the lower classes. Addresses by teachers of science, lectures by members, discussions, experimental work, provision of libraries, evening classes, and day schools were among the activities in which many of the mechanics' institutions engaged. Societies for mutual improvement began to make their appearance in the seventeenth century, e.g. the Society for the Reformation of Manners, in which Defoe was interested, was founded in 1690. The history of mechanics' institutions, however, is usually traced back to two sources — Birmingham and Glasgow. At Birmingham there was organized in 1789 a Sunday society for the purpose of keeping the members of the Sunday

school together; lectures were arranged in mechanics and physical science. In 1796 this society became the Birmingham Brotherly Society, which was joined by the Birmingham Artisans' Library (f. 1797). More important, however, was the influence of John Anderson and Dr. Birkbeck (*qq v.*). At Anderson's University, founded by the former, Birkbeck was able to get into touch with the artisan class, and gave courses to meet their needs. In 1823 the Glasgow Mechanics' Institute was established by former members of Anderson's Institution. Meanwhile a strong appeal was made in 1814 in the *Monthly Magazine* for the establishment of literary and philosophical societies for the middle and lower classes; suggestions were here advanced for the arrangement of mechanics' institutes. In 1821 Mr. Leonard Horne, a merchant and geologist, founded the Edinburgh School of Arts. The London Mechanics' Institution was founded in 1823, with Dr. Birkbeck as its president, and with the strong support of Lord Brougham. It was through the influence of the latter that the Society for the Diffusion of Useful Knowledge (*q v.*) was established in 1825, with the needs of mechanics' institutions and popular libraries in view. The institution included a library, circulating and reference, and a reading room, a museum of machines, models, minerals, and natural history; a workshop and laboratory, classes for arithmetic, algebra, geometry, and their applications; and provided lectures to its members on natural and experimental science, mechanics, astronomy, chemistry, literature, and the arts. The majority of the managing committee consisted of workmen, a common feature in most successful mechanics' institutes. In the same year the Mechanics' and Apprentices' Library was founded in Liverpool, which was influenced by the New York Mechanics' Institution. The equipment and provision of classes and lectures followed the same lines as of the preceding. A feature of the instruction here given was the distribution of prizes. A day school for boys is also maintained as a preparation for the higher work of the evening schools. The Manchester Mechanics' Institution, founded in 1824, has played an important part in the development of technical education in Manchester. It was established "to enable artisans of whatever trade they may be to become acquainted with such branches of science and art as are of practical application in their trade." The building had special accommodations for work in science. Lectures were given twice a week on natural philosophy, natural history, literature, and the useful arts. Classes were held for instruction in writing, grammar, elocution, and composition, arithmetic, algebra, and geometry, architectural and mechanical drawing, vocal music, French, Latin, German, and chemistry. A large library and day schools for boys and girls were also maintained. The institution emphasized more

and more technological instruction, and made rapid progress after the members came to it with better preparatory equipment. In 1880 its title was changed to technical school, and in 1892 it was taken over by the Corporation, which has erected for its school of technology one of the best equipped buildings of its kind in the world. Mechanics' institutions spread rapidly up to 1830, and met with more or less success. Of considerable interest are the few successful institutions which arose in rural centers, *e.g.* Lewes, Chichester, Lincoln, Hastings, and St. Leonards', with circulating boxes of books, traveling lecturers, and local branches among the neighboring villages and hamlets. But the chief centers were London, Lancashire, and Yorkshire. In 1839 a Metropolitan Association of Mechanics' Institutions was formed, following the example of the Union of Mechanics' and other Literary and Scientific Institutions in the West Riding of Yorkshire, and in 1747 the Lancashire and Cheshire Union and in 1848 the Yorkshire Union (with eighty-six institutions) came into existence. According to Sadler, in 1850-1851 there were 610 literary and mechanics' institutions, with a membership of 102,000; following a statement of the Earl of Carlisle in 1846, one in fifty-four of the population in Yorkshire belonged to a mechanics' institution, and in some places one in seventeen.

While the mechanics' institutions were to a certain extent successful, it has been doubted whether they attracted the class of people for whom they were intended. The artisan and lower classes had not the educational foundations to profit by the institutions, and in many cases the fees for membership, classes, and schools appears too high. The educational work of the institutions declined during the class struggles of 1848, but were again stimulated by the grants of the Department of Arts and Science (1859). With their schools of design and scientific instruction, the institution laid the foundation for the development of technical schools.

In the early part of the nineteenth century a number of such institutes were founded in the cities of the United States, and formed an important factor in the developing interest in public education. The institutes of New York, Rochester, and some other cities yet exist. The movement for the establishment of such institutions was connected with the Lyceum movement (*q.v.*).

MEDICAL EDUCATION. — **History.** — In the sense in which the terms are now used medical education has a brief history, for scientific laboratories are even in Germany less than a century old and organized clinical teaching even more recent. Nevertheless, on the continent of Europe, medicine has been for centuries one of the four learned faculties constituting the university. At Salerno, Montpellier, Paris, and other medieval universities the subject was taught canonically: Hippocrates, Galen, and other authorities were expounded to students by professors, each of whom was capable of teaching every branch. The development of anatomy and the physical sciences toward the close of the Middle Ages affected medical thought rather than medical education; for the universities lacked the facilities and the spirit requisite to the adaptation of educational methods to scientific advance. In consequence the most important part of the student's training was obtained after he left the university, and as hospital or physician's apprentice he procured a limited amount of concrete experience. Medical education began to lose its medieval character in Germany early in the nineteenth century, when university laboratories and subsequently university clinics began to be established. Its most rapid strides have been made since 1856, at which date Virchow enunciated his cellular pathology, — the most fruitful single contribution ever made alike to medical education and to medical science.

In Great Britain medical education has followed a different line of evolution. It began in the hospitals, not in the universities. Hence it has been from the first consistently practical. Originally each hospital physician had his own students who, having paid him for the privilege, "walked the wards" in his company. Anatomical and other instruction they procured at private establishments outside the hospitals. In the course of the nineteenth century the various elements were brought together to form hospital schools; the teachers joined to form a faculty; their separate apprentices, brought together, formed the student body; the necessary laboratories were one by one built in close proximity to the hospitals.

Latterly, the marked development of laboratory teaching has tended to force the medical schools into the universities. The hospital schools have been unendowed private ventures, relying on fees. For many years they were

highly profitable; but the needs of laboratory instruction now absorb all fees and call for additional support. The future of medical education in Great Britain lies with universities which, whether endowed or state-supported, will be in position to develop medical laboratories and clinics of modern type.

America practically repeats British experience. The reader is referred for additional details to the account of medical education in America given below.

Medical education aims to bring a number of sciences and a considerable body of knowledge acquired through experience to bear in the treatment of disease. Modern medical education differs from all previous forms of the same discipline in the increased scope and importance of the recognized sciences and the consequent limitation of the part played by mere clinical experience.

In former times, despite the fact that theoretical exposition of traditional medical doctrine consumed a considerable part of the student's time, his actual training was procured practically as an apprentice in hospitals or in the private practice of his preceptor. With the development of the underlying sciences the range of theoretical exposition has been greatly contracted and the apprenticeship has itself fallen into disuse, as it has become necessary and possible to substitute for it more systematic training in medical schools and hospitals connected with them. At the present time the details of medical education vary greatly from country to country. As it is impossible to describe fully the methods pursued in all civilized lands, the present article will restrict itself to four representative countries; namely, Germany, Great Britain, France, and the United States.

For further details concerning medical history, see **GALEN**; **HIPPOCRATES**; **UNIVERSITIES**; **MIDDLE AGES**.

Germany and Austria. — Medical education in Germany and the Teutonic countries in general is, and has long been, exclusively and entirely a university affair, the medical faculty being one of the four traditional faculties constituting the complete German university. This has proved a most fortunate circumstance, for in consequence of the connection of medicine with the university all modern developments in the underlying sciences have been at once brought to bear in the solution of clinical problems, since the hospitals have been throughout the last century under university control. The ideals of the university, which combined research with teaching on a high plane, have been the ideals of medical education in Germany. The profession has therefore always been an educated profession and the German physician an educated man. Matriculation in the medical faculty has been limited to graduates of the German gymnasium precisely as matriculation in any other university

faculty. Up to 1900 this privilege was confined to graduates of the classical gymnasium. Since that day it has been extended on equal terms to graduates of the Realgymnasium and the higher Realschule, with the single additional requirement that graduates of the last-named school must demonstrate an elementary acquaintance with Latin, which subject is not included in the program of the higher Realschule. Despite the lengthy tradition favorable to the classical gymnasium as the basis of all university study, the two scientific secondary schools are gradually making inroads and the proportion of medical students from them is likely in the future to grow steadily. The following table shows the situation in this respect in three recent semesters:—

SEMESTER	TOTAL MATRICULATION IN MEDICAL FACULTY	FROM CLASSICAL GYMNASIUM	FROM REAL GYMNASIUM	FROM HIGHER REALSCHULEN
1908 (Summer)	2,786	2,379 (85 3%)	320 (11 5%)	87 (3 2%)
1909 (Summer)	3,669	2,877 (78 1%)	589 (16 1%)	293 (8 0%)
1910-11 (Winter)	3,536	2,832 (80 1%)	535 (15 1%)	169 (4 8%)

Discussion is still in progress as to which of the three permissible secondary schools constitutes the fittest discipline preliminary to a medical education. The overcrowding of the medical curriculum, partly because of the necessary providing for all the sciences, partly because of the expansion of the medical field itself, is one of several factors responsible for the gradual veering of opinion in the direction of the scientific gymnasium.

The medical curriculum of the university may be divided into three parts, the first containing the sciences which are not in themselves strictly medical, but are essential to a thorough mastery of the medical sciences proper. The sciences in question are chemistry, physics, and biology, including botany. The second division includes the medical sciences proper; namely, anatomy, physiology, pharmacology, pathology, bacteriology, and legal medicine. The third group contains the clinical subjects, medicine, surgery, obstetrics, gynecology, pediatrics, ophthalmology, dermatology, etc. The sciences of the first group—chemistry, physics, and biology—do not, properly speaking, belong to the medical curriculum, and are indeed, as a rule, taught by the philosophical faculty. Only the traditional domination of the classical gymnasium could have kept these sciences so long in the medical curriculum. In consequence of the heavy burden which the student of medicine carries, his study of the preliminary sciences is hurried and unsatisfactory. He is instructed in them almost altogether by lectures, illustrated by

professorial demonstration. In chemistry alone is he actually required to take a practical course. His overwhelmingly theoretical training in these fundamental branches is an obstacle from which the average German student of medicine does not in most cases recover, for, though the teaching is as concrete as illustration can make it, the student does not himself master the chemical and physical manipulations upon which his subsequent studies so largely presume.

The instruction in anatomy is both practical and theoretical. The student is required to procure thorough training in dissection and in practical histology. In addition he attends lectures on general and special anatomy, and toward the close of his medical course is required once more to review the subject by following a course in topographical anatomy. In physiology likewise his instruction is both theoretical and practical, but the lectures are more heavily emphasized than the practical course, which may or may not closely accompany them. Pharmacology and hygiene are presented theoretically with demonstrations. The course in pathology is, like that in anatomy, both theoretical and practical. The student attends lectures on the principles of pathology, on general pathology, and special pathology, all of which are abundantly illustrated with fresh and preserved specimens. In addition he must, in order to pass his examination, himself take part in autopsy work. Bacteriology is assigned to hygiene.

Each of the subjects which have been mentioned in the preceding sketch has in the German university its own institute, or laboratory, as we should call it. The institutes are organized and equipped on substantially similar lines. The head, called the director, is the professor, devoting himself entirely to his specialty. He has a few assistants, the precise number varying with the size of the institute, the number of students, and the number of subdivisions the institute contains. For example, the institute of anatomy invariably contains two subdivisions—gross and microscopic; the institute of physiology has, as a rule, separate subdivisions for chemical, physical, and operative work; the institute of pathology, when completely developed, as at Berlin, contains divisions for gross pathology, pathological histology, experimental pathology, chemical pathology, and bacteriology. It happens not infrequently that one or more of the subdivisions mentioned may be missing, now on account of lack of funds, again, because a suitable incumbent may not at the moment be available. In the long run, these defects are of no consequence to the student, for in the course of his wanderings—the German student being given to migrating during his medical studies—he will find at one university what he may have omitted at another.

The arrangement and equipment of the insti-

tute invariably take thought for both teaching and research, for the German university professor, in the medical faculty as elsewhere, is at one and the same time instructor and producer. The institute contains lecture halls, classrooms, and separate suites for the investigative work of the professor, his assistants, and research students. Laboratory facilities differ in extent, but not in type, in the different universities. They are large at Berlin, Vienna, Leipzig, and Munich,—the anatomical institute at Munich being a palatial structure; they are small and more modest in appearance

at other universities. But in essential character and equipment all take thought for teaching and research at the same high level. This uniformity is due in no small degree to the custom of "calling" professors from one institution to another. Obviously, to induce a rising scientist to leave one post for another, as good or better facilities must be offered to him.

The German student is required to complete his work in all the sciences already named except pathology and bacteriology, before undertaking clinical study. To these sciences he is required to devote at least five semesters. German teaching of these subjects has obvious points of strength as well as weakness. The student is taught by progressive scientists in active laboratories. He works, therefore, in a highly stimulating atmosphere. Abundant opportunities are given to him to do more than the required minimum in any subject in which he develops interest or capacity. Having satisfied the examination requirement, he may enter one of the many advanced courses offered in all institutes or he may as undergraduate volunteer (*Famulus*) make himself practically a part of the organization of the laboratory during vacation time; or, having passed the necessary examinations, he may pause long enough to undertake a piece of original research under the direction of the professor. How large a proportion of the German medical students actually take advantage of the opportunities thus afforded it is difficult to say, but the German system of university instruction is explicitly designed to favor these more active and energetic individuals. The weakness of the instruction lies in the excessively demonstrative character of the required teaching. In all subjects a large part of the student's time is consumed in attending lectures and witnessing demonstrations,—even in anatomy, where, however, there is no lack of practical instruction besides. The unambitious student, who contents himself with doing only what he is by the letter of the law compelled to do, receives an education which is far too theoretical and passive. The practice of medicine involves the actual application of the sciences to clinical problems, but this application can be made only by students who have acquired a practical scientific technique. On the tech-

nical side, however, German medical education is weak unless strongly reinforced by voluntary activity on the student's part. While the best German students can get a rich, varied, and concrete training, the average student and the poorer student may escape with inferior practical training.

Germany is perhaps the only great country in which clinical education is on precisely the same footing as that of the underlying sciences. The German professor of medicine and surgery is a university professor selected for capacity only. As the clinical branches are under-

complete university control, precisely as in any other subject, the state seeks its clinical teachers wherever it can find them. Professors of medicine and surgery are therefore called from one university to another like professors of mathematics, philosophy, or chemistry.

There is a common notion that the German government is enabled to choose clinical professors in this fashion because the state, or, what is the same thing, the university, actually owns the hospitals in which clinical instruction is given. It is supposed that these hospitals have been created simply for the purpose of furnishing the proper opportunities for clinical instruction. As a matter of fact, this is by no means universally the case. In Prussia and in Württemberg the hospitals in which the universities carry on their clinical teaching are state institutions in which, therefore, the university enjoys complete privileges, but in principle the case is not otherwise in other states in which the hospitals are not state institutions. In Leipzig, for example, where the State of Saxony maintains its university, the clinical teaching of the university is carried on in the wards of a municipal hospital. The same situation exists in Munich, where the Bavarian government procures the requisite medical clinics for its university by making a contract with the municipality. At Strassburg the Empire makes a similar arrangement for certain wards with an endowed hospital, as does the Austrian state in Vienna. In Graz a provincial hospital is utilized, in Würzburg a hospital supported by a religious endowment. In all these instances alike the state enjoys essentially the same privileges. It has the right to appoint professors, who in virtue of their appointment to university chairs become physicians and surgeons to the hospitals in question, and the university professor whose clinic is situated in a municipal or endowed institution has the same rights and privileges as are enjoyed by the university professor in Prussia who teaches in a university hospital. These different arrangements work smoothly for two reasons. In the first place the university professor, who is also a hospital physician, receives a salary. His university and hospital work constitute, therefore, the first claim on his time and attention. In the next place executive responsibility and medical care are sharply

differentiated. The hospital authorities, whoever they may be, appoint a hospital administrator who looks after everything that pertains to housekeeping. It is his duty to attend to all details involving supplies, repairs, nursing, etc. Equally complete is the authority of the hospital physicians and surgeons in reference to the medical and surgical conduct of the wards. Superintendent and physicians are not accountable to each other, but both are accountable to the higher authority. Thus all friction is avoided. As these arrangements obtain in all hospitals alike, there is no essential difference between university and non-university institutions.

The clinic differs from the scientific institute previously described in having to care for patients; it resembles the scientific institutes in having also to provide for both teaching and research. Its equipment and organization reflect the three purposes for which it exists. The staff consists of the professor, known as the director of the clinic, assistants varying in number according to the size of the clinic, and advanced and voluntary workers who come into the clinic for the purpose of following the work of the staff or engaging in original research. The equipment consists essentially of the wards, lecture halls always equipped for complete clinical demonstrations, classrooms for the conduct of undergraduate courses, research laboratories for the work of the professor and his immediate assistants. The research laboratories vary in character with the interest of the professor. They are, as a rule, equipped for investigation on the chemical, physiological, or bacteriological side of clinical problems. As a rule, the professor is in general charge of the clinics and the laboratories. Each assistant has a separate ward to look after, and, as a rule, is at the same time in immediate charge of one of the laboratories. While the entire staff is often engaged together on some large problem, the individual members of the staff are usually occupied with their own problems besides. The required clinical teaching takes the form of clinical or surgical demonstration. The undergraduate students assemble daily in the amphitheater connected with the clinic to witness a clinical demonstration by the professor. Two, sometimes three, cases are shown each day. The professor describes in great detail all the significant features of the case, explains the various alternative diagnoses, gives the considerations which determine his judgment in favor of one as against the others, and thereupon launches into a scientific discussion of the disease in question from all its different aspects, pointing out how it is to be distinguished from other similar affections, the course it runs, the treatment to be applied, and the outcome to be expected. For these lectures thorough preparations have been made in advance, and it is not too much to say that, as a rule, they represent a very high order of demonstrative performance.

A medical education largely made up of demonstrative lectures is obviously open to the objection already pointed out in connection with laboratory teaching; namely, that it is too theoretical and too passive. By way of meeting this criticism various devices are resorted to. First, the professor is required to call down into the arena from the amphitheater every student at least twice in the course of a semester. This student, who is known as a *Praktikant*, is expected to examine the patient, to make a diagnosis, and to offer suggestions as to treatment. The professor quizzes him and requires him to defend his propositions. The device cannot be regarded as a great success. The students are nervous, timid, and unequal to the responsibility of making and defending a diagnosis on short notice, for they have had no previous opportunity to examine the patient exhibited. Moreover, the moment the professor devotes himself closely to the *Praktikant* the rest of his audience becomes inattentive. Most professors, therefore, attend mainly to the audience, the part of the *Praktikant* becoming very often almost nominal. In the smaller universities the device works more satisfactorily because, the class being small, greater informality is possible.

2. A second corrective is found in the practical courses in physical diagnosis and clinical microscopy given by the assistants in the clinic. The professor, who has complete control of the material and facilities of the clinic, encourages his assistants to offer special courses designed to train small groups of students in the arts of percussion, auscultation, and palpation, and in the microscopic and chemical examination of urine, sputum, etc. These courses are offered in large numbers, and as abundant material is at hand in the clinics and out-patient departments, the student gets an excellent training. Similar courses are offered in surgery, where dressing, bandaging, and diagnosis are thus taught, and in the woman's clinic, where the student learns the important obstetrical manipulations.

3. As in the laboratory branches, and more commonly than in the laboratory branches, students are invited to enter the clinic informally, chiefly during vacation time, as *Famuli*, or undergraduate volunteers. They are thus privileged to follow as closely as they will all the activities of the clinic.

4. At the conclusion of the student's course, after he has passed all his examinations, he is required to spend a so-called practical year in an approved hospital. As a rule, at least one half of this period must be spent in ward work.

In addition to the required work, above dealt with, the clinics, like the scientific institutes, offer a great variety of courses and a great variety of optional opportunities for the benefit of graduates and undergraduates who are eager to do more than is required of them. On

the clinical side, as on the laboratory side, everything is done to encourage the unusual student. The average and poor students can undoubtedly get along with very little practical exertion on their part, but no student who is eager to do something above the minimum ever lacks abundant opportunity and encouragement. These optional opportunities are so extensive and so largely utilized that they must fairly be considered the very essence of the German system of medical education. Despite its defects, it is therefore probable that the German profession is more scientifically trained than that of any other modern nation. Beyond question this is true of the leaders, namely, the professors and their assistants. Nowhere else, indeed, is there to be found anything that is equivalent to the German assistant who, attaching himself to a laboratory or clinical chief, remains in scientific service for a long period of years, sharing the productive work of his superior, carrying on his own investigations, and coming into close contact with a large body of students. From the assistants, division chiefs and professors are almost invariably selected. The prolonged activity of the assistants in the fundamental sciences prepares them to carry on clinical and surgical work on a thoroughly scientific basis.

In the actual arrangement of his course of study the German student has very considerable leeway. He is controlled only by certain restrictions imposed by the examination ordinance. It is required that he pass all examinations in the scientific branches as far as pathology before he can obtain time credit in any of the clinical subjects. The curriculum is thus divided into two mutually exclusive parts, the first containing physics, chemistry, biology, botany, anatomy, and physiology, the second pathology, hygiene, and all the clinical branches. No fixed order is prescribed for these subjects on either side of the dividing line. This looseness of structure enables students to migrate freely from one institution to the other, an admirable feature, since every student can thus procure for himself the conditions of study which he prefers and the instruction of any teacher whom he especially desires to follow. On the other hand, it is not without its disadvantages, for not infrequently the natural sequence of subjects is disarranged, to the unmistakable disadvantage of the student. Chemistry and physics, for example, should undoubtedly precede physiology, which employs them both. Nevertheless, it happens that a student will complete his required work in physiology before completing either or both of the subsidiary sciences. In the clinical division sequence is in general less material. There are, however, certain principles of order which cannot be safely neglected. Before entering a medical clinic the student requires to understand the more common pathological terms and phenomena, and he must obviously know how

to procure and how to interpret common physical signs; he ought, therefore, to have followed a course in percussion, auscultation, and palpation. Before entering the surgical clinic he should have followed an elementary course in surgical diagnosis and should have learned bandaging, dressing, etc. Obstetrics in the same way presupposes proper training with the manikin. These fundamental correlations having been enforced, it makes little difference in what order the student obtains his clinical training. The student is recommended by a plan of studies put forth by the different faculties to procure for himself at the proper time the fundamental training just described. Nevertheless, he is not required to do so. He may enter any of the various clinics without the proper preliminary discipline, and he not infrequently does. In some cases the technical training is acquired subsequently by following the practical courses above described. Other students procure it by serving as *Famuli* or volunteers in the various clinics prior to their examinations. Others pick up fragments in different ways and trust largely to good fortune. The same result already mentioned thus reappears. The minimum training may be decidedly unsatisfactory. Meanwhile there is hardly any limit to the training that can be procured by earnest and capable students.

It might be supposed that the examinations for the license to practice would interpose so as to cut off those students who have slighted their duties. This is the case in theory, but not in practice. The real guarantee of the competency of the German doctor is not so much the examination now about to be described as the high entrance basis already touched on. Before admission to the university the German student must have passed through a severe educational discipline which rejects the feeble and trains to severe habits of application the more competent. While in the early semesters of university life there is doubtless some reaction from the gymnasial discipline, it is nevertheless true that the German student has a trained mind. He is capable of and accustomed to hard work, and in this fact is found perhaps the most significant factor in connection with the high level of German medical education.

Two examinations are conducted in Germany, one for the title of practical physician (*praktischer Arzt*), the other for the degree of Doctor of Medicine. We may consider the latter first. The degree of M.D. is an academic title, and gives the holder the right to teach. As the examinations leading to it are held subsequently to those which give the title of practical physician, they are largely matters of form. The student is required to prepare a thesis, to submit to a brief interrogation by a committee of the faculty, and to pay certain heavy fees.

The examination for the license to practice

is a much more serious affair. It is known as the state examination, as distinguished from the degree examination, which is a concern of the university as a teaching body. The state appoints an examination commission at each university, made up almost entirely of professors. These commissions delegate the examinations in the different branches to the professors immediately concerned. Examinations take place almost continuously throughout the semester, students being examined singly or in small groups. The examination ordinance prescribes in great detail how the various tests are to be carried on. The first examination lasts four days, of which anatomy consumes two, physiology one, and the remaining subjects one. The regulations specify that in anatomy each candidate must describe a designated part, make a dissection, answering questions as he proceeds, and prepare two microscopical preparations. The examination in physiology covers general physiology, including physiological chemistry, and requires both oral and practical work. The examinations in physics and chemistry are oral only and are meant to keep in view the needs of the future physician. In zoology, comparative anatomy and physiology are to be emphasized; in botany, the anatomy and physiology of plants, especially those with medicinal properties. Should the student fail to pass in any subject, he is allowed two more trials from two to twelve months later. If he fails a third time, he is denied any further chance to retrieve. As a matter of fact, examiners are so reluctant to deprive a student of his career that those who come up for the third time are invariably passed.

The clinical examination, which is considerably more complicated, begins with pathology divided into two parts, pathological anatomy and general pathology, occupying one examiner two days. The candidate must do part of a *post mortem*, writing the protocol. He must make several microscopic preparations, expounding at least one, and finally must be subjected to an oral quiz on the principles of the science. The medical examination falls into two parts, and lasts almost a week. In the first part, conducted by two examiners in the medical wards or out-patient department, the candidate must examine two patients, making diagnoses, suggesting treatment, and giving a prognosis. At home he must write a critical account to be handed in next day. Thereafter daily for four days he must visit the patient once a day or oftener and report his observations to his examiners. The second part consists of a written examination in prescription writing and an oral examination in pharmacology and toxicology.

The surgical examination embraces four parts, and also lasts about a week. The student must handle two cases on much the same lines laid down for medicine, must be examined practi-

cally in bandaging, setting of fractures, etc., and must operate on the cadaver. Obstetrics, ophthalmology, and psychiatry are handled in the same fashion. A single day is devoted to oral examination in hygiene and bacteriology. As a rule, the subjects are arranged at intervals of six weeks. The student must pass in every subject before he can begin his practical year.

The merits of the examination are undoubtedly great. Its general tendency is to force the student to acquire practical skill. The foreknowledge that to pass anatomy he must dissect, to pass in medicine he must make a physical examination and diagnosis, to pass in obstetrics he must participate in a delivery, cannot but exert a favorable influence on the course of his studies. Moreover, the moral and practical influence of meeting his teachers face to face is marked. On the other hand, it must be confessed that examiners are frequently lax. The mere fact that examinations spread through the entire semester conduces to leniency, for, as the professor has all his other engagements to attend to, he is, especially in the larger universities, tempted to hurry, and haste is more apt to result in laxity than in severity. Moreover, though many weak students drop out before the third trial, those who persist can count confidently on being passed. In Austria students are sometimes rejected at the third trial, but on application the Emperor grants further opportunity, so that as a matter of fact, in Austria as in the German Empire, the student who persists will ultimately be successful.

The cost of a medical education is heavy, varying less than one would be disposed to think as between large and small towns. About 300 marks usually are required for tuition fees, books, etc.; living expenses, exclusive of clothing, are estimated at about 1200 marks for the two semesters; 7500-8000 marks make the minimum for the entire course, and leave the student without allowance for examination fees or vacations. Twenty years have made no material change in this respect.

The lot of the needy student is, however, variously relieved. The payment of fees is after all a private matter in the hands of the professor: he is free to waive his rights entirely or to grant a respite, if he pleases. At certain universities, committees are appointed, who, evidence of pecuniary incapacity being shown, grant a delay of six years, at the close of which period the proper officials endeavor to collect the debt; further postponement is common. Scholarship funds also exist, the income of which is annually distributed. In the two semesters 1905-1906, out of a total attendance of 40,509 in Prussian universities 5023 enjoyed fee-exemption; 8435 (many of course already counted among those exempted from fees) received additional aid; among them 966,720 marks were distributed.

Great Britain. — Medical education in Great

Britain is not, as in Germany, controlled by the government, but practically control has been delegated by the government to certain corporations; namely, the royal colleges of physicians and surgeons to be found in London, Edinburgh, Glasgow, and Dublin, to universities possessing medical departments, and to the General Medical Council, a representative body consisting of delegates chosen by all the corporations above mentioned and the registered profession at large. Each of these corporations, with the exception of the General Medical Council, conducts examinations which admit to practice, and each has in theory complete freedom to conduct such examinations as it will. As a matter of fact, however, all conform to something like the same standard, a consequence partly of corporate pride, partly of professional solidarity, partly of the influence of the General Medical Council. The General Medical Council was created by statute in 1858 for the purpose of publishing annually an accurate register of authorized practitioners in order that the public might be enabled to discriminate the trained from the untrained. The Council was also given the right to inspect and to criticize the qualifying, or, as we should say, licensing examinations. This privilege has been skillfully cultivated so as to increase greatly the importance of the Council. It has, as a matter of fact, no coercive power over medical education. It cannot visit a medical school, it cannot dictate the curriculum, it cannot refuse to register a candidate who presents the qualification of one of the above-named corporations, even though it should hold the qualifying examinations to have been unsatisfactory. It can at most protest to the qualifying body itself, and in the event that the offending body fails to meet the objections raised by the council through its representatives it can carry its protest to the Privy Council, which has large powers of action. As a matter of fact, extreme measures have not been necessary. Publicity and constant hammering on the part of the council have succeeded in bringing the less conscientious and advanced examining bodies up to the standard regarded by the General Medical Council as satisfactory.

The situation in Great Britain is much complicated by the fact that medical education was originally altogether in private hands, where it still rests in large measure. The English doctor originally got his education as an apprentice, attaching himself to a hospital physician, whom he accompanied on his rounds and sometimes on his visits. His fundamental training in anatomy he got in the private classes which flourished in London, Edinburgh, Glasgow, Dublin, etc. As students increased in number and hospitals increased in size, the apprentices were brought together to form a school and the hospital physicians and surgeons formed a teaching faculty. These conditions prevailed generally up to very recent

times. The student fees formed a substantial source of income to their teachers, who also profited subsequently by acting as consultants to their students when the latter went out into practice.

This proprietary order is now in process of destruction. The necessity of providing the student with training in the fundamental laboratory branches has eaten up the profits of the proprietary medical school. Almost everywhere practicing physicians have ceased to teach chemistry, physics, anatomy, physiology, and other laboratory branches. As far as these subjects are concerned the British medical school is rapidly approaching the German plan of organization. In the Scottish universities, at Oxford and Cambridge, in the provincial universities, and in the King's and University colleges in London the scientific branches belong to the universities and are handled like other university subjects. They are taught by specialists, in laboratories equipped, as far as financial resources permit, for teaching and research. But nowhere as yet in Great Britain does a university really control its clinical facilities. Clinical teaching, therefore, remains as formerly in the hands of the visiting staffs of the local hospitals. At Glasgow, Edinburgh, and Manchester the local universities have procured some limited privileges in respect to the designation of teachers of medicine and surgery, but in general the clinical branches in Great Britain are taught incidentally by the practicing physicians who form the unpaid staffs of hospitals maintained by volunteer subscription. To this point we will recur in giving an account of the methods of clinical teaching.

No legal minimum is established in Great Britain in respect to general education which must precede the study of medicine. The various bodies dealing with the subject concur, however, in enforcing a requirement which includes English, Latin, arithmetic, algebra, and plane geometry. A student is admitted to a medical school on presenting a satisfactory certificate showing that he has passed the required examinations in these subjects. This standard is indisputably low. It can be met by an ordinary boy of fifteen or sixteen years of age. Students are, in fact, considerably older, the discrepancy being due to the unorganized condition of secondary education in England. (See EXAMINATIONS)

The medical curriculum must be five years in length, and is on the average considerably longer. Its first year is devoted to instruction in the basic sciences — physics, chemistry, and biology. Anatomy and physiology take up the next eighteen months. The rest of the time is devoted to clinical studies, in which pathology is included. The teaching methods are much more concrete and practical than in Germany. Though systematic lectures are held in all subjects, the main emphasis in instruction falls

on the practical exercises, which are well developed. Conditions are less satisfactory in chemistry, physics, and biology, because these subjects cannot be satisfactorily handled when crowded into a single year, but in anatomy and physiology theoretic instruction is distinctly subsidiary. In physiology especially the English excel. The laboratories in this subject have practically without exception individual equipment for every student, enabling him under direction to carry out all the important simpler experiments for himself. Around this experimental course all instruction in the subject centers. An important obstacle, however, arises from the stringent laws governing vivisection. The student's own work is limited to pitted frogs.

The equipment and scope of the scientific laboratories in Great Britain are, except in physiology, generally inferior to those in Germany, because medical schools lack adequate financial support. The university régime has not yet completely established itself, in consequence of which university departments of medicine often rely largely upon student fees which are necessarily inadequate to support teaching and research laboratories. While everywhere interested individuals are found engaged in research at one point or another, research is not yet characteristic of the English laboratory as it is of the German. In many schools anatomy is limited to dissecting, the head of the department being assisted by young physicians waiting for practice. Physiology is in general much better, some of the London laboratories and the laboratories in Edinburgh, Glasgow, Liverpool, Cambridge, and Oxford being fully up to the best continental standard. Pharmacology and hygiene are quite undeveloped as separate laboratories of an experimental character. As a rule, the activity of the laboratory departments expends itself largely in routine teaching. The low standard on which students are admitted, the scant resources which the various institutions command, and the lack of development of scientific ideals combine to keep teaching to an elementary level. This tendency is assisted by the existence of the variety of qualifications and the discrepancies between them. The proprietary school depends for its success on passing its students. As the schools have no resources but fees, they must bend every effort to promote the success of their students in the qualifying examinations. Courses are therefore arranged to comply strictly with the examination requirements which each student has in view. No student is encouraged to do more than he needs. During his spare time he is assiduously coached by his instructor, who, being used up in drill work and practice, has neither time nor energy to engage in investigation.

Pathology is the connecting link in England, as in Germany, between the laboratory branches and the hospital. Material is in general abundant,

but pathological laboratories have been unable to develop on modern lines because of the strong prejudice against vivisection. In the London hospital schools pathology is limited to teaching in the dead house on morphological lines. In the universities the pathological department of the hospital is used for morphological work, while the professor sometimes maintains a separate experimental laboratory on the university grounds. At Glasgow alone does the university possess a modern laboratory of pathology in which morphological and experimental lines are combined. The hospital pathologist is now usually a specialist. His assistants are, however, generally young physicians and surgeons. The subject is taught with reference to its diagnostic use in medicine and surgery rather than as an independent scientific discipline. The students receive a course of instruction in the dead house, and are subsequently drilled in the museum to understand and to interpret pathological lesions as found in preserved specimens.

The English student gets his clinical education by attending the practice of the visiting physicians of a voluntary hospital. The quality of the instruction depends, therefore, altogether upon the character of the English hospital staff. Unlike Germany, where clinical professors are first of all teachers and are called to their posts after achieving distinction in inferior stations, the English hospital physician is a consultant who has in most cases attained his present appointment on the basis of seniority. Education and investigation are therefore secondary considerations. The hospitals lack the means and the attending staff lacks the time to engage freely in clinical investigation. The British student is, therefore, trained to be a practical doctor. He becomes quite expert on the technical side, but he does not receive the scientific discipline which is the distinguishing mark of modern medicine.

While British medicine suffers severely from the limitations just mentioned, it is nevertheless true that in respect to the student's contact with clinical material nowhere else in the world are conditions so favorable. In our discussion of Germany we pointed out that its clinical instruction was overwhelmingly demonstrative. In England, on the other hand, it is overwhelmingly practical. The British student has the freest access to the wards, which contain material enough for continuous participative instruction. Actual and continuous participation of the student in the care of the sick is thus the backbone of British clinical training. The student receives by way of instruction a practical discipline in noting and interpreting physical signs. At the conclusion of a fortnight he begins to "clerk." A physician, his assistant physician, and his house physician receive an assignment of perhaps six or eight students. The students are first taught the systematic taking of notes, whereupon the

house physician escorts the little group on its first ward walk, allotting to each student or "clerk," as he is called, a certain number of cases for which he is to be held individually responsible. Each clerk is required to obtain the complete history and description of each of his cases and to make the requisite chemical and microscopic examinations. He has all necessary freedom and facilities, entering the wards without ceremony and readily procuring such material as he may request. His notes become, as a rule, part of the hospital records of the case. The house physician makes rounds daily with the clerks between 9 30 and noon. Twice or thrice weekly in the afternoon the senior physician conducts the same group over the same ground, quizzing both house physicians and clerks as they move from cot to cot. As each case is reached, the clerk responsible for it steps forward, reads his notes, and defends his findings, his proposed diagnosis, and suggested treatment in reply to the interrogations of the chief. Every student is therefore sharply questioned on his own case, and witnesses at close range the cases belonging to other students in his group. When a case terminates fatally, the teaching group repairs to the dead house to witness the autopsy. This concrete routine continues during about six months. It is supplemented by systematic lectures covering the entire subject. A similar procedure is followed in surgery. The student gets in the first place six weeks of preliminary training in surgical dressing in the out-patient department, where he is taught to dress cuts, to apply bandages, splints, etc. The surgical teaching unit is composed of the surgeon in chief, the assistant surgeon, the house surgeon, and five or six students who follow the daily practical routine for a period of six months. In the operations, which take place four times weekly, the dresser, as the student is now called, is next to the house surgeon first assistant in his own cases. On the occasion of a bedside consultation between a physician and surgeon the students of both attend.

In midwifery every student serves as in-patient clerk to the obstetric physicians for at least six weeks, during which period he takes histories, conducts pelvic examinations under the control of the resident obstetrician, and serves as second assistant at operations. For a fortnight he is on duty in the out-patient maternity. Cases are assigned in rotation. On a clerk's first cases he is accompanied by the junior resident obstetrician. Later he acts alone under distinct restrictions as to seeking aid if difficulties arise. Material is so plentiful that, though twenty cases are required, a student may easily procure from thirty to fifty. English clinical teaching, therefore, amounts essentially to a series of posts or appointments, each characterized by the active participation of the student incumbent. The English clerk and dresser are trained by going through all

the motions which as physicians and surgeons they will have to perform. At the same time they work under such constant supervision and control that the interest of the patient is never imperiled.

The arrangement of the English curriculum is not wholly unlike that of the German. It is divided into two parts, though the precautions to prevent overlapping are less stringent than in Germany. In general, however, the student gives his first year to the basic sciences, the next year and a half or two years to the medical sciences, and the remainder of his time to clinical subjects. The specifications of the different examining bodies as to what he must do in each subject are very minute. He is required by the Conjoint Board in London to devote 180 hours to chemistry, 120 to physics, 120 to biology. The precise period which he must spend on anatomy, physiology, pathology, and each of the clinical subjects is likewise specified in the regulations. London University requires somewhat more; the Apothecaries' Society of London and the Triple Board of Scotland somewhat less.

The examinations follow instruction in emphasizing the practical and concrete. Much the most popular of the various qualifying bodies is the Conjoint Board of the Royal Colleges of Physicians and Surgeons in London, whose examination may be described as typical. Up to 1884 the two colleges conducted separate examinations. In that year they combined to form a Joint Board conferring a single diploma uniting both qualifications. The Board is managed by a joint committee who appoint as examiners teachers from the London and provincial schools. Though the examinations are wholly conducted by teachers, no teacher ever examines his own students.

The examinations in chemistry, physics, and biology, conducted by two examiners in each subject, are both written and practical. The practical and the written marks are combined to determine the student's grade. In anatomy and physiology four examiners each take part. They work in pairs, all being continuously engaged. Neither subject is counted without the other. In anatomy the oral test is conducted on a freshly dissected subject, dissected specimens in alcohol, and the bones. A living model is used for surface anatomy. In physiology no experiments are performed, but apparatus must be demonstrated; histological slides are employed as a basis for questioning. Simple experiments in physiological chemistry must, however, be carried out. Eight examiners officiate in medicine, acting in pairs. Two written papers are set, to be answered on consecutive days. The clinical examination takes place in an examination hall temporarily converted into a hospital ward. Each of the examiners sends from his hospital at least three patients. Every candidate is questioned on one "long"

and two or three "short" cases. The candidate studies the long case for ten minutes, after which he is questioned on it. Thereafter he is questioned more briefly on the short cases. In the evening of the same day he is orally examined in medicine and chemical pathology, including the examination of urine, pathological slides, and gross pathological specimens, fresh and preserved. The surgical examination, similarly conducted, consists of a written paper, clinical or practical work, surgical anatomy, and surgical pathology. Other subjects are disposed of in the same fashion.

The examiners serve for periods of four or five years. The service requires several days at a time twice or thrice a year. For it the ablest and busiest men in the kingdom are obtained. The General Medical Council has the privilege of sending its visitors to inspect the examinations. Through the circulation of examiners and visitors a fairly uniform standard has been generally procured.

The examinations thus just described are in point of principle perhaps the best to be found anywhere. They permit interaction between the schools and the profession, and they demonstrate the feasibility of giving a practical test to large numbers of students annually by the combined action of teachers and practitioners. Such defects as may be pointed out in the English examinations are attributable to the conditions under which medical education in England is carried on, and have nothing to do with the principle on which the examinations are conducted.

The effort to keep insufficiently endowed medical schools above water has led to a steady increase of tuition fees, which have thus doubled in the last half century. About 1870 the total cost of an education at a large London school was 95 guineas; in 1880, 132; at present, 180. The smaller metropolitan and the provincial schools are slightly cheaper, — Liverpool costing about £150. The expense varies somewhat with the choice of the qualifying agencies: it costs perhaps £10 less to prepare for the Conjoint Board than for a university degree. Scotland has not yet adopted the composition or combined fee: at Glasgow the sum total of separate fees amounts to £150. Adding in the expense of living, we may estimate the total cost involved at £250-300.

France. — Medical education in France is, as in Germany, a university affair, but the medical faculty is only imperfectly developed on university lines. The professors in the medical department, in the laboratory as well as in the clinical branches, are practicing physicians, excepting only the anatomist at the larger universities. The appointments are made, with rare exceptions, from the local profession. Despite the association of medical teaching in France with the universities, the essential conditions resemble closely the proprietary arrangements characteristic of England.

In order to enter upon medical study the student must have achieved the baccalaureate that marks the termination of the *lycée*; in addition, he is required to pass a year in the study of the preliminary sciences. A baccalaureate course of secondary instruction plus a certificate covering the study of physics, chemistry, and biology, issued by the faculty of science, constitutes the basis of medical education throughout France.

The baccalaureate course takes any one of several forms, all leading to the same degree. Since the far-reaching secondary school reforms of 1902, complete parity has prevailed as respects the classics, the sciences, modern languages, and mathematics. A four-year primary course constitutes the uniform basis; seven years of secondary instruction follow, divided into two parts, four and three years in length respectively. In the first part, the student elects between the classics, omitting Greek if he desires, and a modern course largely scientific in content; in the second, he chooses one of four groups — the classic languages, Latin and modern languages, Latin and science, modern languages and science. The *lycées* of large cities are large and flexible enough to contain all the alternatives; at smaller places the authorities select with regard as far as possible to local conditions.

The French, like the German, boy is thus systematically trained with a clear view to a possible professional superstructure. The baccalaureate basis bears everywhere the same value. The teachers, who are shortly to begin training men to law, medicine, or what not, know exactly on what they have to build. It is true that, consistently with the Napoleonic origin of the system, the spirit of the *lycée* is less individual than the range of selection that it allows; but not improbably this is in part a survival from the former régime under which all were put through the same grind. Meanwhile, France has gone farther than any other country in stipulating that medical education shall repose not only on a sufficiently high and entirely uniform basis, but that this basis must be determined or supplemented by the specific requirements of modern medicine.

French medical education is overwhelmingly clinical in character. The French student is supposed to devote his mornings to hospital work. All laboratory instruction and all lectures on nonclinical topics are relegated to the afternoons. During the first year hospital attendance is optional. The afternoons of the first year are devoted to dissection. For this work the arrangements are still more or less crude and the teaching is confined almost wholly to dissection. The other sciences which occupy the afternoons of the subsequent years are demonstratively presented. Physiology is the only one which, even so, is adequately incorporated in the curriculum.

The clinical instruction of the French univer-

sities is conducted in municipal hospitals, in which certain privileges have been granted by contract to the State. In Paris, for example, the university controls eighteen services in hospitals scattered through the city. The heads of these various services, being university professors, are selected by the State from among those who have previously won in competition the position of associate professor (*agrégé*). As the university services are incapable of accommodating the number of students engaged in clinical study in Paris, the university recognizes the teaching of other incumbents of hospital posts. To each teacher, whether a member of the university faculty or merely a recognized hospital physician or surgeon, students are assigned in groups of twenty for terms of four months. The instruction is of a highly practical character. It begins and ends with the exhibition, examination, and observation of cases, and that too without preliminaries. There are no introductory or special classes in physical diagnosis or clinical microscopy. To acquire facility with the stethoscope, to learn percussion and palpation, a student is left to his own devices. In laryngology and otology alone are practical courses in technique conducted at the medical school.

The French student in general, the Paris student in particular, enjoys practically unrestricted opportunity to gain thorough familiarity with disease. Twenty students daily accompany a teacher through the wards. Each student receives by allotment two or three beds. His appointment runs for four months, during which period he has unobstructed access to his cases. He is expected to see them daily before the arrival of the chief. At the foot of each cot hangs a card bearing the names of those in charge. They are, to employ the English phraseology, clerks, to whom on reaching the case the teacher at once turns for a statement covering history, physical examination, etc. In the course of his two-hour clinic the instructor will exhaustively discuss three or four cases. Students other than those in personal charge of a case are free to interpolate questions or suggestions; and, the condition of the patient permitting, to verify by examination points of special note. Instruction in surgery and gynecology is largely limited to diagnosis. It proceeds on much the same lines as instruction in medicine. Students are at work in the wards examining patients by nine o'clock. An hour later the professor enters. The patient having been selected, the student in charge reads his report, the professor commenting as he proceeds. On a small black-board close by, professor or student sketches in order to show the size and relation of the parts in question or to depict a proposed operation. Toward the close of his studies the student is eligible to the position of *externe*, or assistant in the out-patient department, to obtain which post he must successfully com-

pete in examination. At the termination of the externship he is eligible to an internship, also after competitive examination.

The foregoing description shows at once the strength and the weakness of French medical teaching. It is weak in so far as laboratory instruction remains in an undeveloped condition. The only laboratory branch which the student has a chance to follow thoroughly is anatomy. On the other hand, as far as a physician can be made by clinical experience, the French student is admirably situated, particularly if he is fortunate enough to obtain the posts of *externe* and *interne*. In the latter, which lasts four years, he is in position to utilize, subject of course to the control of his chief, the almost unlimited clinical resources of the French hospitals.

The general arrangement of the French medical school does not favor investigation on modern lines. The laboratory branches are domiciled in the medical school in one part of the city, the clinical teaching is carried on in scattered hospitals elsewhere. The French medical schools, therefore, are lacking in organic character. There is little intercourse, social or scientific, between men occupied in the laboratories and those occupied in the clinics.

The arrangement of the French curriculum is very simple. The preliminary sciences — chemistry, physics, and biology — claim the first year, anatomy occupies the afternoons of the second. Banishment of the other medical sciences to the afternoon of the clinical year keeps them in a largely theoretical and distinctly subsidiary form. The clinical assignments, which constitute the main part of all French medical education, come in no fixed order. In general, medicine and surgery occupy the third and fourth years; obstetrics, psychiatry, and other branches, the fifth year.

The four years forming the medical curriculum proper are divided into sixteen "inscriptions," the five examinations being fixed in reference thereto. The first, devoted to a practical dissection and an oral in topographical anatomy, may come at the student's option between the sixth and the eighth inscriptions; the second, *viva voce* in histology, physiology, and physiological chemistry, between the eighth and tenth; the third, practical tests in operative medicine, topographical anatomy, and pathological anatomy, and oral in topographical anatomy, general pathology, parasitology, and obstetrics, between the thirteenth and sixteenth; at any time after the sixteenth, the fourth and fifth, including therapeutics, hygiene, legal medicine, *materia medica*, pharmacology, surgery, medicine, and obstetrics. Finally, the student must submit an acceptable thesis.

America. — Medical education in the United States and Canada lacks the uniformity characteristic of medical education in Germany and France and the comparative uniformity which

prevails in Great Britain. During the first four fifths of the nineteenth century medical education in America was wholly proprietary in character. The so-called medical departments belonging to universities were nominal in their relationship. The rapid settlement of the country called for a large number of physicians much more rapidly than they could be effectively trained. What happened was this. Groups of physicians in different places banded themselves together to form so-called medical schools. These schools had in the first place neither resources nor facilities. They were practically establishments for didactic teaching of descriptive anatomy and for the inculcation of textbook knowledge of medicine, surgery, and obstetrics. They had originally no hospital connections whatsoever. In time wretched dissecting rooms, carelessly conducted by busy practitioners, were added, and clinical instruction was improved by the exhibition of an occasional patient from the dispensary.

A step in advance was taken when the group of men constituting the medical school happened to be the staff of a hospital. These men had, it is true, little interest in education, but it paid them to teach, because, in the first place, they received the fees of their students, and in the second place their students sent them frequent consultations after they engaged in practice. The hospital connection led to the building of amphitheaters in proximity to the wards and to the occasional exhibition of patients in them; but the teaching was for the most part of didactic character, and the student was without any effective contact with disease. The schools were thus nothing more than money-making ventures unrestrained by the law. A school that began in October would graduate a class the next spring. No educational requirement was made for entrance. Any applicant who could pay his fees was accepted. As state boards were not in existence, the school diploma was itself a license to practice. A student for whom a majority of the professors voted passed. Educating medical students thus became so profitable a business that chairs in medical schools became valuable pieces of property and were freely traded in. First and last, the United States and Canada have in a little more than a century produced 457 medical schools. Of these about 130 still survive. Illinois has produced 39, Missouri 42, New York State 43, Indiana 27, Pennsylvania 20, Tennessee 18. The city of Cincinnati produced forth 20, the city of Louisville 11.

Against these demoralizing conditions protests were raised from time to time, but little progress was made until the early eighties. Since that day the course of study has been gradually lengthened until it is now everywhere four years, though a year may still vary from six to nine months. The course of study has also been generally, though not universally,

graded. Almost without exception American medical schools all furnish some clinical teaching, though as yet only a few are adequately equipped in this respect. More progress has been made on the laboratory side, and it is almost universally conceded that the prospective student of medicine should possess some definite preliminary general education. The most important single event in the reconstruction of American medical education was the establishment in 1893 of the Johns Hopkins Medical School, entrance to which was limited to holders of a bachelor's degree.

In reference to their entrance requirements the medical schools of the United States and Canada now fall into three divisions. The first includes those that require two or more years of college work for entrance, the second those that demand actual graduation from a four-year high school or its approximate equivalent, the third those that ask little or nothing more than the rudiments of a common school education, perhaps not all of that.

About twenty institutions belong to the first class, all of them university departments supported and administered as actual parts of their respective universities:—

University of California	University of Nebraska
University of Chicago	University of North Dakota
Columbia University	kota
Cornell University	University of Pennsylvania
Harvard University	vania
University of Indiana	University of South Dakota
University of Iowa	kota
Johns Hopkins University	Syracuse University
University of Kansas	University of Utah
Leland Stanford Junior	Wake Forest College
University	Western Reserve University
University of Michigan	sity
University of Minnesota	Yale University
University of Missouri	

Something like fifty medical schools constitute the second division. Great diversity exists in the quality of the student body of these institutions. The regents' certificates in New York, state board supervision in Michigan, control of admission to their medical departments by the academic authorities of some universities insure a fairly capable and homogeneous enrollment in some medical schools. Others—some of them university departments, some of them proprietary institutions—are quite lax in the interpretation of what constitutes a high school education. The reader must be warned that the assertions of the school catalogues and the requirements of the state boards cannot in general be relied on. Careful investigation alone can determine whether an institution that represents itself as on a high school basis really enforces its alleged standard. The third division contains schools that are practically without any adequate entrance standard at all. While these schools are most numerous in the South, they are to be found in almost all other sections of the country.

In their external aspect the curricula of American medical schools follow a certain general type. The first and second years are devoted to the laboratory branches and the third and fourth to the clinical branches. The laboratory branches are developed on something like the German model in the schools included in the first division above mentioned. These institutions have at least four separate laboratories, — anatomy, physiology, and biochemistry, pharmacology, pathology, and bacteriology. Hygiene is more or less prominent, especially at some of the state universities. In some schools increasing facilities are offered in all branches for both teaching and research. Most of the institutions here in question offer the entire medical course, but a few of them offer the laboratory branches in one place, the clinical in another — an arrangement greatly to be deplored, since both sides suffer seriously when isolated from one another. Six of these schools are so-called half schools, offering only the work of the first and second years. This arrangement involves perhaps no serious difficulty, as far as the teaching of anatomy and physiology is concerned, but unless, as at Oxford and Cambridge, a small hospital is at hand, pathology must be taught from museum specimens, models, and microscopic mounts, all of which have serious limitations. The schools of the second division move within narrower limits. Most of them live on fees. The best of them develop highly a department or two. The other departments are necessarily restricted. The quality of the student body likewise imposes limitations. Proper laboratory courses are impossible to boys whose preliminary education is defective. The best of the American medical schools on a high school basis endeavor, by careful selection of students and extraordinary pains in teaching them, to make the most of their situation. Less intelligently conducted institutions, content to operate on a lower plane, are commercially effective. Not a few are frankly mercenary.

There yet remains for our consideration the third division; namely, schools practically without any entrance requirements whatsoever. The conditions which prevail in these institutions are altogether scandalous. It is indeed stretching terms to speak of laboratory teaching in connection with them at all. Schools of this description may be found in the South without a dollar's worth of apparatus of any description whatsoever. In others the so-called laboratories prove to be dirty and disorderly rooms practically without equipment. Some of them have no dissecting rooms worthy the name. At others the dissecting room is filthy beyond description. Almost all make a pretense to teach chemistry, but schools can be found in which not even a complete set of reagents is at hand for the entire class.

In respect to facilities for teaching the clinical branches, conditions in America are even less

satisfactory than we have found them to be on the laboratory side. In order to teach clinical medicine, surgery, and obstetrics, a medical school requires adequate hospitals properly equipped with laboratories in charge of physicians and surgeons selected by the medical school on the basis of their fitness to teach and investigate. These fundamental requisites are met by very few of the medical schools in the United States and Canada. The University of Michigan, the Johns Hopkins Medical School, and the University of Pennsylvania are the most prominent examples of medical schools which are in complete control of hospitals of fair size, that of the Johns Hopkins Medical School having been recently increased by the addition of certain previously missing clinics. Of the three institutions named, however, only the Johns Hopkins Medical School has freely selected its clinical teachers from other institutions. A few other medical departments might be mentioned which are closely affiliated with certain hospitals, enjoying considerable influence in the selection of the hospital staff, which thereupon becomes their own medical faculty.

More generally, even those schools which under existing conditions are regarded as possessing fairly satisfactory clinical facilities have practically no voice in the appointment of the hospital physicians and surgeons who are their clinical teachers. In order to get teaching facilities at all medical schools have found it necessary to appoint to professorships individuals who happen already to possess hospital staff appointments. These individuals are rarely interested in teaching for its own sake, and still less commonly devoted to research. Teaching is with them a side issue to which they give a certain amount of time and energy, not so much because any immediate remuneration is attached thereto as because it leads to consultation business in the future. To make matters still worse, hospital appointments in America rarely involve continuous service. America has devised the so-called rotating system under which physicians and surgeons serve their hospitals for terms varying from two to four months, at the conclusion of which period a new staff comes on duty. In order, therefore, to enjoy teaching facilities throughout the year the medical schools are required to appoint to professorships all the successful incumbents of a hospital service, or, more commonly still, to piece together facilities acquired in different hospitals. These hospital appointments are made for personal or political, rarely for professional or scientific, reasons. The fact that they are unpaid and discontinuous is of itself fatal to serious endeavor. It need not surprise us, then, to learn that American hospitals are provided, as a rule, with no facilities for research. With few exceptions their laboratories are limited to routine. The pathological depart-

ment is a dead house, and often not even that.

Even under such circumstances the amount of material that is available for instruction is almost invariably below what is regarded as satisfactory in Great Britain or on the Continent. The best of American medical schools controls only a few hundred beds. A very large proportion of those that are fairly well equipped have access only to some 100 or 150 beds. Proper facilities in infectious diseases and obstetrics are almost never found.

In all sections of the country schools can still be found that are practically without hospital connections of any kind whatsoever. In Massachusetts, New York, California, Illinois, Mississippi, Nebraska, Oregon, and other states, institutions with no, or almost no, clinical connections still confer the degree of M.D.

Methods of teaching medicine and surgery must under these circumstances vary greatly. In the Johns Hopkins Medical School a highly successful effort has been made to combine the best points of the English and German methods. German university ideals and the English clerkship and dressership have been united to form a highly effective pedagogic method. Following the successful experiment there made, the English clerkship has been introduced by other schools, whenever indeed hospital managers have been willing to receive students on an intimate footing in their wards. Less favorably situated schools have had to rely on amphitheater demonstrations, resembling the demonstrative clinics given in Germany. The inferior institutions cling to didactic textbook instruction.

The cost of medical education in the United States varies greatly. It has long been alleged that the inferior medical schools are maintained for the benefit of poor boys who could not otherwise procure a professional education. The hollowness of this pretense is exposed by the fact that a four-year medical education in the feeblest schools of Chicago, Philadelphia, or Baltimore costs in tuition fees and board about \$1500, for which sum a student could get two years of college work in a state university followed by four years in its medical department.

All chartered medical schools in the United States and Canada have the right to confer the degree of M.D., but this degree does not carry with it in America, as it does in Great Britain, the right to practice. The abuses in medical education led different states to create boards for the examination of those applying for the license to practice. The powers given to these bodies vary from state to state. In general, the state boards have the right to refuse an examination to students coming from low-grade educational establishments, but thus far this power has not been vigorously utilized. In addition, state boards are commonly authorized to refuse to recognize a medical education which has not been preceded by an adequate

general education; but as to this also the state boards have been very slow to assert their powers. The real secret of the failure of the state boards, however, to eliminate incompetent institutions is traceable to the almost universal employment of written examinations. The only sort of licensing test that will suppress schools without adequate laboratory and clinical facilities is a practical examination such as obtains in Great Britain and in Germany. Proprietors of feeble medical schools have long since found out that they can effectively meet the state board tests by drilling their students in the various compends that have been prepared with a view to meet the exigencies of the state board examinations. In consequence of universal laws forbidding teachers of medicine to be members of these boards, the examinations in question are conducted by men who have no touch with education and are consequently often decidedly unsuitable. The participation of teachers and the introduction of the practical examination would go far to assist in the rehabilitation of all medical education in America.

Medical Sects.—No special provision is made in Europe for sectarian education in medicine. Every intending practitioner is required to conform to the law. He must meet the requirements as to preliminary education. He must follow the regular course of medical instruction, and he must pass the requisite examinations. Having done so, he is free to call himself any kind of doctor that he chooses. As a matter of fact, it is found that, having complied with the usual requirements, only a negligible fraction prefer a sectarian designation.

Very different is the situation in the United States in this respect. There are in the United States some thirty sectarian institutions, about a dozen of them homeopathic, half a dozen eclectic, and the rest osteopathic. These schools have low entrance requirements, poor laboratory facilities, and almost without exception feeble clinical facilities. In general, the eclectic and the osteopathic schools are more wretched than the homeopathic. For the benefit of these institutions separate state boards are at times created, and their graduates are enabled to enter the practice of medicine on easier terms than are applied to the graduates of regular schools. Despite the fact that the laws deal with them favorably, sectarian schools are on the decline.

Postgraduate Instruction.—The rapid progress of medicine in recent years makes it advisable for men engaged in practice to make some systematic effort to keep in touch with recent development from time to time. This has led to the institution of postgraduate instruction in almost all parts of the world. In Germany postgraduate instruction takes one of several forms. The so-called Central Committee for postgraduate medical education,

established in 1900, organizes lecture and laboratory courses in all the leading German cities annually. These are meant for the benefit of practitioners who cannot leave home in order to engage in study elsewhere. The local courses are free of charge and are conducted partly by local physicians, partly by lecturers from other towns. The courses vary in character. Sometimes successive weekly addresses on different topics are given by different lecturers; again weekly clinics may be held; again practical courses are instituted, requiring two or three hours weekly and lasting two or three months. In the university towns the university instructors often offer continuation courses four weeks in length, dealing with all the newer topics likely to interest the practitioner. At Köln and Düsseldorf academies of practical medicine have been created, though they have thus far amounted to little more than the local establishments previously described. In addition to these more or less organized opportunities, postgraduate work can be procured in every German and Austrian university. Many courses are announced in the catalogues, but not infrequently practitioners, native and foreign, combine to request particular courses, arrangements for which can always be easily made. Little special provision for this sort of graduate study is made in Great Britain or France, though visitors are always welcome to the clinics in both countries. In Paris especially the rounds of well-known physicians are daily followed throughout the year by throngs of visitors. In London a Postgraduate Association has been formed which sells a composition ticket admitting to all clinics, clinical lectures, operations, and autopsies of the constituent hospitals. The most active seats of postgraduate training in England are the schools of tropical medicine in Liverpool and London.

In America the postgraduate school may be characterized as a compensatory adjustment. It is an effort to mend a machine that was predestined to break down. The more conscientious and intelligent men trained in the American medical schools above described were bound to become aware of their unfitness for the responsibilities of medical practice. The postgraduate school was therefore established to do what the medical school had failed to accomplish. Thirteen such institutions exist in the United States, of which those in New York and Philadelphia command good teaching hospitals. Their instruction is immediately practical in character, and has little to offer the well trained undergraduate student, who will do better to resort to a university for such additional opportunity as he wishes. It seems not improbable that the improvement of medical education in America may cut the ground out from under the postgraduate school as it has been here developed.

Medical Education of Women. — Access to

the medical faculty on the same terms enjoyed by men was granted to women by the Swiss universities in 1876. The constituent states of the German Empire one by one adopted the same policy. Women have been admitted to the medical faculty of the Prussian universities on the same terms as men since 1908. The number of women students of medicine in Germany is, however, still small (241 in the summer semester of 1910), the reason being that secondary school facilities have not yet been provided in sufficient abundance. In Great Britain a medical school for women was established in London in 1874, — the London School of Medicine for Women, through which nearly one thousand students have passed since its opening. The other hospital schools of London exclude women. Of the provincial universities Durham, Manchester, Liverpool, Birmingham, Leeds, and Bristol are coeducational, as are Aberdeen and Dundee in Scotland. Edinburgh examines, but does not teach, women students of medicine. Glasgow teaches them in a separate establishment. In the United States both women's medical schools and coeducational medical schools exist. There were in 1909, 91 medical schools admitting both men and women, three admitting women alone. Of 921 women students in that year 752 attended coeducational institutions; 169 attended women's medical schools.

Medical Education of the Negro. — The medical education of the negro is, particularly in the southern part of the United States, a matter of urgent importance. The relations of the two races are such that both suffer in point of health if either is neglected. A considerable supply of well trained negro physicians needs, therefore, to be procured. For this purpose there exist now in the United States six medical schools for negroes, but of these six only two — one at Howard University, Washington, D.C., the other Meharry Medical College at Nashville — are in position to give a fair training in medicine.

A. F.

For existing conditions in medical education in other countries, see the articles on education in the respective countries; e.g. BELGIUM, EDUCATION IN; NETHERLANDS, EDUCATION IN; etc.

Information as to current work in medical schools is obtainable from the following sources:—

Germany and Austria.—From the *Vorlesungs-Verzeichnisse der Universitäten von Deutschland, Oesterreich und der Schweiz*, published twice yearly by the Akademischer Verlag, München. This publication includes the announced courses of all universities. Each university also publishes its own catalogues: *Vorlesungs-Verzeichnisse* (lectures) and *Personal-Verzeichnisse* (list of professors and students). Physicians desiring post-graduate opportunities should consult the program of the *Dozenten-Vereinigung* of Berlin, the publications of the Kaiserin Friedrich Haus, Luisenplatz, Berlin, and the Anglo-American Medical Association, Berlin, and one of the following:—

Karger, *Das Medizinische Berlin*; G. Mamlock, *Wegweiser für Aerzte*; J. Pagel, *Aerzteführer durch Berlin*. As to Vienna see *Aerztliche Fortbildungskurse*, published by Urban und Schwarzenberg.

Great Britain.—The two leading London medical journals, *The Lancet* and the *British Medical Journal*, publish annually in August or September "Educational Numbers," containing full information respecting all British medical schools, examinations, etc. Every school issues a calendar.

France.—An English Handbook to the Paris Medical School by A. A. Warden (London, 1903).

Levret de l'Étudiant L'Université de Paris—obtainable from the Bureau des Renseignements à la Sorbonne, 47 Rue des Ecoles, Paris.

Programmes-Généraux des Cours et Conférences. Imprimerie Chaix, Boulevard St. Michel.

Every university issues its own *Levret de l'Étudiant*.

America.—*The Journal of the American Medical Association* (Chicago) publishes annually in August an "Educational Number," giving full information respecting all American medical schools. The Council on Education of the American Medical Association (Chicago) also publishes a large number of pamphlets dealing with the same topic. Every medical school issues a catalogue.

MEDICAL INSPECTION OF SCHOOLS.

— Medical inspection is an extension of the activities of the school in which the educator and the physician join hands to insure for each child such conditions of health and vitality as will best enable him to take full advantage of the free education offered by the State. Its object is to improve health conditions among school children, safeguard them from disease, and render them healthier, happier, and more vigorous. It is founded on a recognition of the intimate relationship between the physical and mental conditions of the children and the consequent dependence of education on health conditions. Systems of medical inspection have been in existence for some eighty years, but it is during the past quarter of a century that its rapid and world-wide spread has taken

place. It is now a movement, national in scope, in most of the important countries of the world. It is found in all of the continents, and the extent of its development in different countries is, in some measure, proportionate to their educational enlightenment.

Status in Different Countries.—*France.*—The first work seems to have been done in France, where the law of 1833 and the Royal Ordinance of 1837 charged school authorities with the duty of providing for the sanitary condition of school premises and supervising the health of school children. A few years later, in 1842 and 1843, decrees were promulgated directing that every public school should be regularly inspected by a physician. Despite these early beginnings, genuine medical inspection, in the modern sense of the term, was not begun in France until 1879, when the work was organized in Paris. Eight years later medical and sanitary inspection were made obligatory in all French schools, public and private.

At the present time, medical inspection in Paris is carried on by a corps of 210 school physicians, who are selected by competitive examinations, and each of whom has supervision over not more than 1000 children. At least twice each month these doctors visit each school and make careful examinations of the sanitary conditions of the premises, giving special attention to lighting, ventilation, cleanliness, and water supply. After this, a visit is made to each classroom, and the children are selected who appear to need special attention. After this general inspection, individual examinations of children are conducted in the inspector's private room. Three classes of children are examined: first, those whom the doctor has selected as appearing to need special attention; second, those referred to him by the teachers and masters; and, third, those who have returned to school after absence from unknown cause. Each child is given a thorough physical examination during the first months of school life, and a complete record of the results is entered on an individual record sheet, which follows the child through his subsequent school career. Measurements of height and weight are made every six months, and entered on these sheets, together with records of illnesses and the results of physical examinations. Parents are informed of any defects or diseases discovered, and urged to secure remedial treatment. In the other cities of France the systems followed are based on that of Paris, but are in general less thorough, and in the smaller places are mostly restricted to measures for the prevention of contagious diseases.

Germany.—Dresden began work in 1867, when vision tests were instituted. Frankfurt-on-the-Main appointed a school doctor in 1888, and the example was rapidly followed by other cities. Wiesbaden soon developed a

plan that was widely copied and became a model for the work throughout the empire. The procedure followed by the school doctor on his monthly visits to each school closely resembles that already described as followed in Paris. General inspections of premises and classrooms are first made, followed by individual examinations of selected pupils. Each child is given a physical examination before first entering school, and subsequent ones in the second, fourth, sixth, and eighth years of school life. A record sheet is kept for each child, and parents are notified of the results of the examinations.

There is wide variation in the thoroughness of medical inspection in different parts of the empire. Thoroughly organized systems under state regulation exist only in Saxe-Meiningen and Hesse-Darmstadt, where every school, both public and private, in the country as well as in the city, is provided with a state-appointed doctor. In other states, the school doctors are appointed by and work under the municipal *Magistrat*, the local board of education, or the board of health. In 1908 some 400 towns and cities had systems of medical school inspection, employing about 1600 physicians. Three plans of employing and remunerating these school doctors are common. Under the first, the physician is employed on full time, and is paid a salary ranging from \$1750 to \$2750 per annum, and has the right to a pension. Under the second plan, a salary of from \$150 to \$250 a year is paid for part-time services, and the work is usually carried on in addition to other public health services, for which separate payment is made. The third plan is to pay on a per capita basis according to the number of children inspected, and the scale of payment ranges from six cents to fifteen cents per child per year, the average being about twelve cents. Payment is also sometimes made at the rate of sixty cents to one dollar for each class examined. As yet there are only a few school nurses in Germany, Charlottenburg and Stuttgart being the only cities which employ them. Other movements, however, closely allied to medical inspection, such as school feeding (*qv*) and the provision of special classes for exceptional children, have made notable progress. (See GERMANY, EDUCATION IN.)

Great Britain — The medical inspection of schools and scholars is carried on under the provision of the Education Act of 1907, which is mandatory in its nature and applies to the schools of England and Wales. In Scotland it is carried on under the Education Act of 1908, which went into force at the beginning of 1909, and conferred on school boards powers necessary for a universal system of medical inspection. In Ireland compulsory medical inspection does not exist. Such as is carried on, is mainly performed by the school inspectors of the National Board, who are not medical men. The object of medical inspection in Great Britain, as stated in the *Memorandum of the Board*

of Education, is "to secure for every child, normal or defective, conditions of health compatible with that full and effective development of its organic functions, its special senses, and its mental powers, which constitutes true education."

Although London began medical inspection in England by the appointment of a school physician in 1891, the movement was only sporadic in its development up to the passage of the act of 1907, making it universal and compulsory. The details of organization are in the main left in the hands of the local authorities, although some minimum requirements are laid down by the *Memorandum of the Board of Education*. These provisions include the physical examination of each child at the time of its entrance to a public elementary school, and at least three subsequent examinations. The first of these takes place during the third year of school life, or about the seventh year of age; the second during the sixth year of school life, or about the tenth year of age; and the third at the time the child is about to leave school and go to work.

School nurses were first employed in England, where their work in London dates back as far as 1887. The first school nurses, in the newer acceptance of the term, were appointed in 1901 by the London School Board, and their employment is now becoming general in other cities.

Other Countries — In Norway, the movement has progressed steadily since 1885, when some localities supported regular school physicians. Permissive regulations were passed in 1889, and two years later obligatory ones were adopted. Sweden is probably the country where the term "school physician" was first employed in its modern sense. As far back as 1868, medical officers were attached to the staff of each large school. Their duties and spheres of activity have been greatly extended, beginning first with the higher, and since 1895 including the primary schools. Denmark has no regular system of medical inspection, nor any legislation directly providing for it. There is, however, a certain amount of work carried on in the elementary and secondary schools of the larger towns and cities. Austria was the first country to enact effective legislation covering inspection in elementary schools. This was done through the ministerial decree of 1873, providing for the regular employment of school physicians. In Hungary, the act of 1885 established the office of school physician. In Switzerland, the medical examination of children is recommended by the Federal government, but not enforced. Nevertheless some thirteen cantons carry out the recommended inspection, and in some cities very thorough work is done by the school doctors. Russia has made provision for medical inspection since 1871, but with the exception of a few cases it has not extended

MEDICAL INSPECTION

beyond the secondary and higher schools. In Bulgaria organized work dates from 1904, while in Roumania adequate legislation has existed since 1899.

In Belgium, medical inspection is the rule in the more important municipalities, and Brussels is credited with establishing the first system of medical inspection, in the full modern sense of the term, in 1874, when school physicians were appointed who inspected each school three times a month. From its inception the system was remarkably successful, and was copied in other Belgian cities and served as a model for systems in Switzerland. Some of the earliest work of school dentists and oculists was done in Brussels.

A number of countries in America, outside the United States, have more or less well developed systems of medical inspection. In Canada, Montreal began work in 1906, when fifty school physicians were appointed. This was followed by work undertaken in Halifax and Vancouver in 1907. Some work is being done in all of the provinces, and there is legislation providing for its existence in Ontario, Manitoba, and Alberta. Medical Inspection in Mexico dates from 1896, when the Department of Medical Inspection and School Hygiene was organized under the Director-General of Elementary Instruction, and a few doctors were appointed. Since that time there have been numerous reorganizations, and a constant extension of the system, until it is now very complete and notably efficient in the city of Mexico and its suburbs. The work has spread until it is fully organized in the state of Chihuahua, and partly so in Guanajuato and San Luis Potosi.

In South America, the Argentine Republic and Chile both began medical inspection of schools in 1888, and in both republics the systems are very thoroughly developed. The work in Australia, Tasmania, and New Zealand dates from 1906, and includes not only preventive measures, but much scientific study of the results of the examinations. This renders the reports from these states unusually valuable. In Japan, medical inspection has been compulsory and universal since 1898. Only small towns and country districts are exempted. In Cairo, Egypt, the first school physician was appointed in 1882, and the system has been continued ever since.

United States — Boston was the first city in the United States to establish a regular system of medical inspection. This was in the year 1894, and came as a result of a series of epidemics among the school children. New York City followed in 1897, when 134 school physicians were appointed. Chicago and Philadelphia began work in 1895 and 1898, respectively. In all of these instances medical inspection had in its inception the sole object of reducing the number of cases of contagious diseases among the pupils.

MEDICAL INSPECTION

From the greater cities, the movement rapidly spread to the smaller ones, the first step in most cases being taken by a local medical society offering to carry on volunteer work for a limited time to demonstrate its desirability.

Number of Cities in the United States having Systems of Medical Inspection (1890-1911).

During the school year 1910-1911 an extensive study undertaken by the Russell Sage Foundation, and covering 1038 cities, including nearly 90 per cent of the municipalities having regularly organized systems of public schools under superintendents, showed that in 443 cities there were systems of medical inspection in force. In other words, regularly organized systems of medical inspection constitute an

Medical Inspection Laws in 1911.

States having mandatory laws, in black;
Those having permissive laws, in cross hatch;
Those having no laws, in outline

integral feature of the school systems in 43 per cent of the cities of the United States. The preceding chart represents graphically the number of cities having systems of medical inspection each year since 1894, and shows how the growth of the movement has been at first slow and gradual, and, in the last few years, increasingly rapid. It presents the facts for

the 411 cities, from which it was possible to secure information as to the date of beginning medical inspection.

The tabulated returns of the study above referred to show that the adoption of medical inspection of schools has been more general in the cities of the North Atlantic and Western than in the Central and Southern states. In the North Atlantic states 58 per cent of the cities have systems of medical inspection, in the South Atlantic group 31 per cent, in the South Central states 35 per cent, in the North Central division only 29 per cent, and in the Western states 57 per cent. In compiling these data the states have been grouped by divisions according to the standard adopted by the Bureau of the United States Census.

Medical inspection as now carried on in American schools may be divided into three classes of work. The first is inspection for the detection of cases of contagious disease. The second consists of examinations conducted by the teachers themselves to detect defective vision and hearing. The third comprises complete physical examinations of the pupils to detect physical defects and organic diseases.

Inspection for the Detection of Contagious Disease. — Where there is any sort of medical inspection it is nearly invariably true that inspection for the detection of contagious diseases is included as one of the most important items. Indeed, there are many cities where this is the only work carried on. Its object is primarily the protection of the community, and because of this the work is often conducted by physicians of the board of health. In most cities the inspectors call daily at the schools to which they are assigned and examine such pupils as are referred to them by the teachers and principals. These pupils include all who have returned to school after being absent on account of illness or from unknown causes as well as those who are in school and suspected of suffering from some infectious or contagious ailment. In most cities examinations are made for the following diseases: Scarlet fever, diphtheria, measles, smallpox, chicken pox, tonsillitis, pediculosis, ringworm, impetigo contagiosa, trachoma, and other transmissible diseases of the skin, scalp, and eye. Tuberculosis, when thought to be far enough advanced to be a menace to public health, is generally reported to the chief medical inspector before excluding the pupil from school. (For further discussion, see **CONTAGIOUS DISEASES; INFECTIOUS DISEASES.**)

When children are excluded, brief but sufficient reason therefor is written on an exclusion card, which is sent to the parents. One copy is filed with the school authorities, and one with the board of health. School physicians are forbidden to make any suggestions as to treatment and management of the pupils who are sick. This rule is nearly universal, and is made imperative.

Vision and Hearing Tests. — The policy of legislators and school administrators in arranging to have tests for sight and hearing conducted by school teachers themselves rather than by specialists has occasioned many expressions of surprise and no little criticism. This policy, however, has reached its present wide development on the recommendations of specialists themselves who deem that such tests are wholly within the capacity of the teacher. It is their opinion that children are subjected to less nervous strain when tested by their teachers than when tested by strangers, and, therefore, exhibit themselves in a more natural way. It is always the intention, however, wherever this policy is followed, to have scientific examinations made by specialists in cases where defects are apparently revealed by the teachers' tests.

Work of this sort has greatly increased since the action of the state legislature of Massachusetts in 1906 in passing a medical inspection law containing mandatory provisions by which vision and hearing tests are conducted by the teachers. During the hearings on the Medical Inspection Bill a mass of evidence was presented by experts bearing upon the question of the feasibility of such tests. (For further discussion see **EAR**, section on Tests of Hearing; and **EYE**, section on Tests of Vision.)

Physical Examinations. — Municipal and educational authorities in America have very generally realized that the theory on which physical examinations are conducted rests on a different foundation from that underlying medical inspection for contagious diseases. Historically, physical examinations have usually followed, and almost never preceded, the inception of inspections for the detection of contagious disease. The latter is primarily a protective measure, and looks mainly to the present safeguarding of the community. The former aims at securing the physical soundness and strength of the individual, and looks far into the future. It has been brought into being by successive results of a long series of studies which have shown that there are many physical defects which are common among children and have an important bearing on their present health and future development, and may be easily remedied or modified, if they are discovered early enough. Moreover, these studies have demonstrated that without a system of medical inspection only a small minority of these defects are discovered by teachers or known to them, to the parents, or to the children themselves.

The following is a copy of the record card which is in use in New York City to record the results of the individual physical examinations of pupils. By referring to the headings under which the entries are made we may see what the defects are which the school physicians search for and record if discovered. The list for New York City is not very different from the list commonly employed in other parts of the country. It may be regarded as typical.

MEDICAL INSPECTION

The most extensive results yet secured in the United States as to the physical conditions of school children are those from the examinations conducted by the board of health in New York City. The results for the year 1908, as published in the *Report of the City Superintendent of Schools* for that year, are as follows:—

	TOTAL	PERCENTAGE
Number of children examined	252,254	100
Found to have no defects	65,616	26
Found to be defective	186,638	74
Found to be suffering from		
Malnutrition	8,054	3.2
Chorea	821	.3
Tubercular lymph nodes	997	.4
Cardiac diseases	1,964	.8
Pulmonary diseases	673	.3
Skin diseases	4,115	1.6
Orthopedic defects	1,728	.7
Defect of vision	26,224	10.4
Defect of hearing	2,287	.9
Defect of nasal breathing	36,099	14.3
Defect of palate	897	.4
Defect of teeth	135,166	53.6
Hypertrophied tonsils	44,880	17.8
Defective mentality	691	.3

The School Nurse.—The school nurse is now considered to be one of the most necessary adjuncts of the better developed systems of

MEDICAL INSPECTION

medical inspection. The total number employed in American cities at the beginning of the year 1911 is 415, of which 375, or 90 per cent, are in the North Atlantic and North Central States.

The first regular employment of trained nurses in connection with the work of medical examination was begun in New York City in December, 1902, when a corps of nurses was established at a salary of seventy-five dollars per month each. Since that time experience has proved, especially in the largest cities, that the employment of competent school nurses is almost a necessity. The nurses are especially valuable in reducing the number of exclusions of children from school on account of minor illnesses. Many of these when properly treated by the nurse in school do not prevent the regular attendance of the child. The trained nurse greatly enhances the success of the work of the school physician in improving the health of the school children. She aids the school teacher in detecting the first signs of approaching illness. She sees to it that all excluded cases are placed under treatment as soon as may be, so that there is the least possible loss of time from school and interference with education. She treats those cases which would for various reasons receive no attention at their homes. She assists the school physician in the clerical work of recording the results of the physical examinations which he conducts.

In many cases it is also found feasible to employ the nurses during the summer months, when there is no school, in work directed to the lessening of the great mortality rate among infants from summer diarrhea, due mainly to improper care and feeding. Again, she aids materially in the anti-tuberculosis campaign. About a quarter of the cities having any sort of medical inspection employ school nurses, and the number is increasing rapidly. To sum up the case for the school nurse: she is the instructor of parents, pupils, teachers, and all members of the family in the principles and practices of hygiene. She is a most efficient link between the school and the home.

Dental Inspection.—Increasing attention is being given to the inspection of children's teeth in American schools, and the work is being more and more commonly carried on as a branch of medical inspection in a semi-independent way (See *TEETH, CARE OF AMONG SCHOOL CHILDREN*.)

Summary of Conditions in the United States.—Reference has been made to the study of the status of medical inspection which included 90 per cent of the cities of the United States having school systems organized under superintendents of schools and which brought together the data as to the status of the movement in the spring of 1911. The following is a brief summary of conditions as revealed by that study.

MEDICAL INSPECTION

	NUMBER	PER CENT
Cities from which returns were secured	1038	100
Having systems of medical inspection	443	43
Having inspection for the detection of contagious diseases	405	39
Having vision and hearing tests by teachers	552	54
Having vision and hearing tests by physicians	258	25
Having complete physical examinations	214	21
Having dental inspection by dentists	69	7

	NUMBER
Systems administered by boards of education	337
Systems administered by boards of health	106
Number of school physicians employed	1415
Number of school nurses employed	415

Administration.—There are two standard types of administration, that under the Board of Health and that under the Board of Education. In the early days of medical inspection practically all the systems were administered by local boards of health, but in recent years the tide has turned the other way, until at the present time about one quarter of the cities have systems under their boards of health, and in the remaining three quarters the board of education is the controlling body. According to the best American practice there should be one medical inspector and one nurse for each 2000 pupils in cities where the nurse and physician are employed on full time and the schools are so large and so close together as to reduce to a minimum the time spent in going from one building to another. These figures must be radically altered for rural districts.

Salaries.—Professor William Osler is credited with saying with regard to the work of medical inspection in England, "If we are to have school inspection let us have good men to do the work, and let us pay them well. It will demand a special training and a careful technique." It is certainly to be regretted that this point of view has not been more generally taken in America. In this country the financial remuneration of school physicians and school nurses is almost invariably inadequate. The salaries paid range from nothing to \$4000 per annum. In many localities the local medical association conducts medical inspection for a year or two without cost to the city in order to demonstrate its value. This results in the tabulated returns showing that in a considerable number of cities the doctors and nurses receive no pay at all for their services. It may also be a factor in bringing about the extremely

MEDICAL INSPECTION

low salaries that are received after regular payment is given. The following table is made up from the study of conditions in 1038 cities, and shows the number of localities in which the salaries of doctors and nurses fall within the salary limits named in each group. That is to say, the first line shows that there are seventy-five cities in which the doctors donate their services and twenty-one in which the school nurses do the same. The second line indicates that there are forty-seven cities in which the salaries paid to the doctors are between \$1 and \$100 per annum.

	NO. OF CITIES WHERE DOCTORS RECEIVE SALARY INDICATED	NO. OF CITIES WHERE NURSES RECEIVE SALARY INDICATED
No salary	75	21
\$1-100	47	—
101-200	50	—
201-300	44	2
301-400	25	—
401-500	24	1
501-600	18	2
601-700	2	17
701-800	12	24
801-900	6	15
901-1000	13	2
1001-1500	18	2
1501-2500	7	—
2500-4000	3	—
Fees according to service	19	1

The table shows that there are more cities paying their school physician at the rate of between \$100 and \$200 per year than there are paying salaries of any other amount. On the other hand, the average salary is somewhat higher than this. If computed on the basis of the table and without taking into account the number of doctors employed in each individual city, the average salary would fall within the group receiving from \$201 to \$300 per annum. In a similar way the second column of the table shows that there are more cities paying their school nurses from \$701 to \$800 per annum than there are paying any other salary, but the average salary would be about \$700 per year. Of course the sum of \$200 per annum is given in return for only a part of the school doctors' time. Nevertheless it has come to be regarded as a somewhat standard rate of remuneration for school physicians all over America. There are cases where so little work is required that this amount may be considered adequate, but undoubtedly in most cases it represents an undue degree of sacrifice on the part of the school physician.

Cost and Time.—The per capita cost of medical inspection for salaries alone ranges from about one-half of one cent for vision and hearing examinations conducted by teachers to about \$1.25 for complete physical examinations in a few localities. These extremes,

MEDICAL INSPECTION

however, do not at all represent average conditions. In general the per capita cost of medical inspection in America ranges from ten to fifty cents per annum. It seems to be a fair generalization to say that medical inspection for the detection of contagious diseases can be adequately performed at an annual cost of about fifteen cents per capita, while physical examinations similarly performed and including the inspection for the detection of communicable disease cost about fifty cents. Physical examinations for the detection of non-contagious physical defects can be made by an experienced school physician in about twelve to fifteen minutes per child. Vision and hearing tests alone demand from three to five minutes per child. Systems of medical inspection which include careful physical examinations of all children cost the most and are by far the most valuable. From a social and economic point of view they are by far the cheapest in the better sense of the word, as they are the most far-reaching, both in their immediate and indirect results. Permanent efficiency requires skilled workers, careful administration, and adequate remuneration.

Legal Provisions in the United States. — The first state law providing for the medical inspection of school children appears to have been passed by Connecticut in 1899. It did not

MEDICAL INSPECTION

provide for the complete sort of inspection now carried on in many cities and states, but only for the testing of eyesight by teachers every three years. Complete medical inspection with examinations for the detection of physical defects was first provided for by state enactment in the permissive law of New Jersey passed in 1903. This was followed by the mandatory law of Massachusetts in 1906, which has been several times amended and has served as the basis for a majority of the bills which have since been presented in other state legislatures. At the present time (June, 1911) seven states have mandatory laws, ten have permissive ones, and in two states and the District of Columbia medical inspection is carried on under regulations promulgated by the boards of health and having the force of law. The map on page 184 shows graphically which states have mandatory laws, which permissive ones, and in which states there are no laws at all.

The past five years have furnished a large body of experience under varying conditions in widely separated localities. The lessons of this experience can be read in the substantial agreement of a majority of the laws in several salient features. This is graphically shown by the following tabular presentation of the principal features of the different laws and regulations.

PRINCIPAL FEATURES OF STATE LAWS AND REGULATIONS PROVIDING FOR
MEDICAL INSPECTION, 1911

No.	STATE	DATE ADOPTED	PERMISSIVE OR MANDATORY	ADMINISTERED BY SCHOOL OR HEALTH AUTHORITIES	INSPECTION BY DOCTORS FOR CONTAGIOUS DISEASES	PHYSICAL EXAMINATIONS BY DOCTORS	INSPECTION OF TEACHERS, JANITORS, AND BUILDINGS BY DOCTORS	SIGHT AND HEARING TESTS BY TEACHERS	NORMAL PUPILS TRAINED IN TESTS OF SIGHT AND HEARING	PROVISION FOR EMPLOYMENT OF NURSES	PENALTY FOR VIOLATION OF LAW	PARENTS COMPELLED TO BRING CHILD IN CONDITION DISCOVERED
1	California	1909	P	S								
2	Colorado	1909	M	S				*				
3	Connecticut . . .	1907	P	S	*	*	*			*		
4	District of Columbia	1907	M	H	*		*					
5	Indiana	1911	P	S		*		*				
6	Louisiana	1911	M	S				*			*	
7	Maine	1909	P	S	*	*	*	*				
8	Massachusetts . .	1906	M	S or H	*	*	*	*	*			
9	Minnesota	1910	M	H	*	*	*	*	*			
10	New Jersey	1903	M	H	*	*		*				*
11	New York	1910	P	S	*							
12	North Dakota . .	1911	P	S		*						
13	Ohio	1910	P	S	*		*			*		
14	Pennsylvania . .	1911	M	S	*	*	*			*		
15	Rhode Island . .	1911	M	S	*	*	*					
16	Utah	1911	M	S		*		*				
17	Vermont	1910	P	S	*							
18	Virginia	1910	P	S	*		*					
19	Washington . . .	1909	P	S	*	*	*			*		
20	West Virginia . .	1911	M	S	*	*						

On four points there is substantial agreement. The first is that the administration of the provisions of the law is placed in the hands of the school authorities. The second, third, and

fourth are respectively the placing in the hands of school physicians the inspection of contagious diseases, the physical examinations, and the inspection of teachers, janitors, and build-

ings. In six cases the provision is made for testing of vision and hearing by the teachers.

MEDULLA.—See NERVOUS SYSTEM.

MEGALOMANIA.—This is a symptom in various mental diseases which is indicative of a feeling of well-being. The individual believes he is capable of doing more than usual, and often more than he is capable of doing. Associated with it there are usually delusions of great wealth and supernatural powers, sometimes of divinity, and occasionally this develops upon a basis of depression. The symptom is found in mania (*q.v.*), in paresis (*q.v.*), and in dementia precox (*q.v.*). It is typical of paranoia, but we now know that paranoia (*q.v.*) is the rarest of mental diseases. This feeling of well-being is probably to be associated with the day dreaming and feeling of power and wealth of children, and these ideas of children very likely are based upon the same sort of mental processes as those of the insane.

S. I. F.

See MANIA.

MEIEROTTO, JOHANN HEINRICH LUDWIG (1742–1800).—German scholar and rector of the Joachimstal Gymnasium at Berlin. He strongly supported the attitude of Frederick the Great (*q.v.*) on secondary education. While he recognized the impossibility of teaching Latin as a spoken language, although Latin and Greek were still subjects studied by all pupils, he did not neglect German grammar and literature, history and geography. Some attention was paid to mathematics, but none to modern languages. He became a member of the Academy, of the Supreme Council of Schools, and of the Consistory of Berlin. He wrote many works on classical subjects, among them being *Manners and Customs*

of the Romans at different Periods of the Republic (1778–1779); *De educatione et institutione quam M. T. Cicero in erudendo filio Marco secutus est* (1784); *Grammatici est aliquid nescire* (1785); *De praeceptorum Romanorum auctoribus ac primum de Taciti moribus* (1790); *De Sallustii moribus* (1792).

MEIKLEJOHN, JOHN MILLER DOW (1830–1902).—Professor of Education at St. Andrews University, Scotland. He was the son of a private schoolmaster in Edinburgh, and after being educated by him he entered the University of Edinburgh. On graduating he taught for several years in schools near Manchester and London. He contributed frequently to the press, and in 1864 was war correspondent in the Danish-German War. In 1874 he was assistant commissioner on the Endowed School Commission, and in 1876 was appointed to one of the first chairs of education in Great Britain, founded simultaneously at Edinburgh and St. Andrews under the Bell Educational Trust. In this position Professor Meiklejohn showed a high conception of his duties and of the difficulties before him in view of the fact that there were scarcely any textbooks at all on the subject in England. The problem of education he conceived to be “how to train a child to healthy activity, to self-help, to a harmonious development of its powers of body and mind.” He was opposed to the dry mechanical methods which prevailed in the schools of his day, and one of his chief contributions was a series of school textbooks which laid emphasis on a rich content. Among these may be mentioned: *Brief History of the English Language and Literature*; *British Empire, its Geography, Resources, Landways and Waterways*; *New Geography on the Comparative Method*; *English Language, its Grammar, History, and Literature*; *English Readers*. He also translated Kant’s *Kritik der reinen Vernunft*, and wrote a memoir on *An Old Educational Reformer, Dr. Andrew Bell*. His conception of the function of a professor of education is well stated in his inaugural address in 1876 (see Barnard, *Am. Jour. of Ed.*, Vol. XXVIII, pp 220–224) and in the *Training of Teachers and the Chair of Education in the University of St. Andrews* (1879).

MELANCHOLIA.—A term used to indicate (1) a symptom corresponding with a feeling of sadness or depression, or (2) the association of a number of symptoms making a specific type of disease; (a) simple melancholia, in which there is the combination of depression, retardation, and a difficulty in thinking, (b) the agitated depression which is made up of depression with motor unrest and a difficulty in

thinking; and (c) involution melancholia, or a melancholia occurring late in life. The various forms of melancholia, which are found in a variety of diseases, are probably only exaggerations of the normal feelings of sadness and depression, exaggerated under abnormal conditions. Lack of initiative, apparent stupor, due to general slowing of movement, bizarre ideas, are among the symptoms. The individual constantly thinks of methods to escape the depression, often ending in suicide. Recovery is usually not accompanied by mental deterioration. The first attack usually comes before the age of twenty, and in childhood is not as severe as in later life. The appearance of any or of all the symptoms in a child should be looked on with suspicion; advice properly given at the time of the first attack may ward off others. The symptoms in simple melancholia are so similar to those occurring after prolonged work that they have been explained as fatigue or exhaustion phenomena. The treatment consists of enforced rest; a building up of the body, and sometimes restraint, are necessary. In some cases considerable watchfulness is required to prevent the patient from committing suicide.

In agitated depression there is an emotional condition accompanied by lack of inhibition of movement, e.g. constant moving, picking at the face, wringing of the hands, tearing the hair, etc. This is typical of the cases of depression which are of sufficient intensity to need hospital treatment and restraint. Involution melancholia comes late in life, and has no educational interest. No symptom is so common in mental diseases as is depression, and it is not infrequent in physical diseases. This symptom should be the first to attract attention, and should cause the teacher to summon "first aid" assistance from the proper authorities in charge of the school health. S. I. F.

MELANCHTHON (SCHWARTZERD), PHILIP (1497-1560).—The great German reformer and humanist, the *Præceptor Germaniæ*, was born at Bretten, the son of an armorer. He received a careful education at home, and his ability attracted the interest of his uncle Reuchlin. Before proceeding to the University of Heidelberg he attended the Latin school at Pforzheim. At the university the humanist movement was not yet firmly established, but Melanchthon, in addition to official courses, devoted himself to the new studies. Graduating in 1511, he proceeded to the University of

Tübingen, where he remained for six years, taking his M.A. in 1514. Here he studied not only the classics, but mathematics, astronomy (or better, astrology), physics, medicine, and Roman law. In his own hall or bursa he lectured on Vergil and Terence, and also gave lectures on eloquence and history. In 1518 he was called to the University of Wittenberg as teacher of Greek, and almost from the first began to exercise that influence which was to mold German education for more than a century. His inaugural address, *De corrigendis adolescentium studiis*, was a defense of humanism against its opponents, giving in brief a history of culture and an attack on scholasticism. Melanchthon urges the proper organization of studies based on grammar, dialectic, and rhetoric, and including mathematics, poetry, and oratory. The classical languages themselves are of importance as opening the sources of wisdom. In his address at the opening of the Nuremberg school he gives a more complete definition of his educational ideas: it is the divine purpose that children be trained to piety and virtue, and only through the sciences can religion and good laws be maintained; the sciences are a gift of God; hence impiety and ignorance go together. A similar statement was made by Melanchthon in connection with the school at Soest. At Wittenberg Melanchthon in 1519 became Bachelor of Theology. In addition to his public lectures, which in a very short time attracted students from all sides of Europe, he maintained a private preparatory school in his home, and thus had an opportunity of closely studying the requirements of a secondary school.

Melanchthon's influence lay in five directions: (1) as one of the most popular university teachers in Germany he trained a large number of young scholars who were spread over the country as teachers; (2) in visitation articles and whenever he made a visitation, he made direct suggestions for the erection of schools, beginning with the modest requirements of Latin, religion, and music; (3) as an organizer of schools, e.g. Eisleben, Magdeburg, Nuremberg, and Soest, he established a tradition which was followed elsewhere; (4) in the same way his influence was exercised on the German universities, e.g. Marburg, Königsberg, Jena, Frankfurt-a.-O., Leipzig, Rostock, Heidelberg; some of these he helped to found, some he reorganized, some copied almost verbatim the organization of Wittenberg made in 1536; (5) almost as important as the other sources of his influence was Melanchthon's remarkable activity as an author of textbooks and editions of classical and theological works. As early as 1516 he edited the plays of Terence, but his first important work was the *Institutiones Græcæ Grammaticæ*, dealing with accidence, syntax, and etymology. In 1519 appeared his first work on rhetoric, *De Rhetorica Libri tres*, issued in 1520 as *Institutiones Rhe-*

torica, in 1531 as *Elementorum Rhetorices, Libri duo*, and again in 1542 under the last title with additions. The *Loci Communes*, 1521, was the first work on evangelical doctrine based on the Epistles of St Paul. His Latin grammar, which appeared in 1522, attained great popularity and went through numerous editions. In 1523 appeared his plea for humanistic studies, including history, oratory, poetry, prose, verse, composition, and language, under the title *Encomium Eloquentiæ*. The *Enchiridion Elementorum Puerilium* (1524) was a handbook for beginners giving the alphabet, a number of prayers, and extracts from the Bible. A similar work for beginners of Greek was the *Institutio puerilis Literarum Græcarum* (1525). In 1530 he published a commentary on certain of Aristotle's political writings, followed in 1532 by a commentary on Aristotle. He also collaborated in a textbook on simple mathematics (1535). He had already expressed his interest in history by editing the *Chronicles* of Carion in 1532 and 1558-1560. In 1538 he published *Philosophiæ moralis Eptome*, an outline of his ethics, and in 1549 the *Initia Doctrinæ physicæ*. His collected works are contained in the *Corpus Reformatorum* by Bretschneider and Bindseil. His influence as a theologian cannot be better expressed than by stating that he was the author of the *Augsburg Confession* (1530), the *Brandenburg Reformation* (1539), and the *Wittenberg Reformation* (1545). How great a reputation was attained by Melancthon is attested by the invitations not only to other German universities, but to France and England. But in spite of opponents the Preceptor of Germany remained at Wittenberg, devoted to the task of building up German Protestantism on a solid foundation of humanistic studies.

MELBOURNE, UNIVERSITY OF, AUSTRALIA.—An institution endowed and incorporated by the Legislative Council of Victoria, Australia, in 1853 "to hold forth to all classes and denominations . . . encouragement for pursuing a regular and liberal course of

education." Work was begun in 1855 with three professors and sixteen students and an annual government endowment of £9000, raised in 1904 to £11,000. From 1883 onwards there has also been added to the annual endowment a fluctuating sum granted by annual vote. The government of the university is in the hands of a council of twenty members elected by the senate, which consists of all male doctors or masters of the university. The council elects the chancellor and vice-chancellor of the university. A professional board considers all questions relating to studies and discipline. There are now the following faculties: law, medicine, engineering, arts, science, agriculture, veterinary science, and dentistry. There are further a department of education and a university conservatory of music. The following colleges are affiliated with the University: Trinity College (Anglican), Ormond College (Presbyterian), Queen's College (Methodist), and Australian College of Dentistry. In connection with the Training College of the Victoria Education Department, courses are given in education and lead to a university diploma. Evening courses are given leading to the following diplomas: education, agriculture, mining and metallurgy, and architecture. A department of university extension under the charge of a university extension board is also maintained. The enrollment of students in the university in 1910 was 1136 (345 arts and education; 34 science; 121 law, 60 engineering; 360 medicine; 65 dentistry; 23 agriculture; 92 music; 36 veterinary.)

MELODY.—See **MUSICAL TERMS**.

MEMORIAL COLLEGE, MASON CITY, IA.—A coeducational and military institution, founded by the Sons of Veterans, U. S. A., in 1900, and maintaining a college, preparatory school, military academy, normal college, commercial college, school of oratory, college of music, and correspondence school. The entrance requirements are fifteen units. The A.B. and B.S. degrees are conferred.

MEMORY.—Memory may be defined as the return to consciousness of some experience, together with the awareness that it has been present earlier at a definite time and place. Four parts of the memory process need to be

distinguished in the discussion. These are learning, retention, recall or revival, and recognition. The organic basis of memory is some change induced in the nervous system in learning that is retained in the organism as a disposition toward revival and is rearoused when a suitable incentive presents itself. The essentials of the memory process are the same as those involved in the formation of associations (*q.v.*).

Memory Types — All memory may be conveniently divided into rote and logical memory. In rote memory the work must be done from the beginning, while in logical learning the new material is connected with the earlier acquired knowledge to constitute a well-ordered whole. Recent investigation has been devoted for the most part to determining the laws that control rote learning and the retention of materials learned by rote. To make sure that there has been no earlier partial learning and to get rid of all trace of logical learning, the experiments are ordinarily made with nonsense syllables made up of two consonants and an intervening vowel. These syllables are presented in series of twelve or sixteen by some mechanical device that insures that they shall be separated by regular intervals and exposed for a constant time. The adequacy of the learning is tested both by the number of repetitions required for the original learning and by the number of repetitions required for relearning after an interval. The accuracy of learning and retention may also be tested by determining the number of mistakes made in supplying the second member of a pair of syllables when the first of the pair is given, and also by measuring the time required to supply the second member. The first method is known as the method of relearning, or the saving method, the second as the method of successes. Both apply to the tests of retention rather than of the original learning.

Laws of Learning — The results of these investigations may be briefly summarized in laws of learning and of forgetting. The laws of learning are: (1) Learning is a direct function of the number of repetitions. Each repetition increases the liability to retention by the same amount, whether the repetition be the first or the fiftieth. The repetitions after the series has been learned to the point where it can be said through without mistake are just as effective as the earlier ones. (2) Capacity for learning and for immediate retention increases with age up to the attainment of maturity, and then persists unchanged until the onset of senile degeneration. The only justification for the opposed popular belief is that it is probable that things once learned in youth will be retained more completely in later life. (3) Rhythm is an essential aid to learning. One cannot avoid some rhythm, and the more pleasant and easy the rhythm the easier and quicker is the learning. Syllables that belong to the same rhythmic unit are more closely

connected than syllables that are contiguous in the series but belong to different groups.

(4) When a series is learned, associations are formed not merely between contiguous memories, but between the noncontiguous memories of the series. The strength of the association is directly proportionate to the nearness of the members. (5) It is easier and quicker to learn a series by dividing the repetitions over several days than to make all the repetitions on one day. The more the repetitions are divided, the greater the saving. Any selection must be learned and forgotten several times, if it is to be permanently retained. The explanation is probably that the older associates are stronger, or more effective for reinstatement than the newer. In the interval between repetitions the connection between nervous elements grows stronger and thus does the work of added repetitions. (6) When a selection of any material is to be learned, it is more economical to learn it by reading through from beginning to end each time than to learn it by parts and then join the parts together. When learned stanza* by stanza, for example, the first stanza will be repeated more often than is necessary before the latter parts are learned. Then, too, unnecessary associations are made between the end of each stanza and its beginning. These associates not merely waste time, but interfere with the correct associates at the moment of recall. The one disadvantage of the method is that one is likely to get discouraged after the reading has been repeated several times and to read more slowly, so that what is gained in the number of repetitions may be lost in time. To avoid this it is suggested that pauses should be made now and again at natural divisions, and then go on again from that point. This rests the learner without the disadvantages of learning by parts.

Retention — The laws of retention have also been investigated by these methods. The associations once formed tend to disappear more or less gradually, and it is important to know the course of their disappearance. The laws that have been determined for the disappearance of associations and the processes that aid and retard the process may be stated in brief form. (1) Forgetting goes on rapidly at first, and then very slowly. Meumann found that 30 per cent was forgotten the first hour, 32 per cent in twenty-four hours, 50 per cent in six days, 80 per cent in 30 days, and 97 per cent in 120 days. Forgetting is much slower for sense material than for nonsense syllables. Ebbinghaus found that with poetry 7 per cent was retained after twenty-two years. (2) Associations persist longer if no other work is done for five or six minutes after learning is completed. Other activity seems to interfere with the "setting" of the associations that was referred to above. (3) If a syllable has been learned in one connection, it is more difficult to learn it in another connection than if

it had not been learned before. One associative connection seems to check the formation of others. (4) If two associates have been formed with the same syllable, it is more difficult to reinstate either than if that were the only one. Both of these last laws hold only for associations that are only partially formed. If the first association is fully formed, it may help in the formation of the second.

In logical memory learning is quicker and forgetting is slower than in rote learning. Here the main thing is to understand, and when a statement is understood it is connected with general principles or meanings that have been developed earlier and have become so fixed through frequent repetition that they are never forgotten. Whenever a new fact is connected with one of these, it takes on much of the permanence of the meaning itself. It is learned at once, and will be remembered for an indefinite time. The course of forgetting is much slower than for the material learned by rote.

Recall.—The laws of recall are the laws of association. What shall be recalled at any moment depends upon the cue provided by the environment or the train of thought, the connections that cue has made earlier, and the attitude that dominates at the moment. It should be said that recall is very seldom of the particular images that were earlier experienced; ordinarily one recalls meanings. One remembers that certain events happened and remembers the fact on the basis of very schematic imagery. Memory is not a mere reinstatement of an earlier process, but is a representation of the event in some other terms. This fact that meaning and image may be altogether unrelated is very evident from the difference in mental imagery. One person may remember everything visually, another in auditory or motor terms, and yet both may remember the same event with equal completeness.

Recognition, the assurance that the event recalled or the object seen has been appreciated before at a definite time or place, depends upon the associations and movements that it arouses when it presents itself. Other events that were associated with it are aroused, and these finally give it a setting in a definite time and place. The times and places that stand out prominently in the past, which serve as points of reference for the other events, are fixed through the frequency with which they have been recalled.

Mnemonics.—One problem much discussed in connection with memory is the advantage of artificial devices for improving the memory. One of the oldest is to connect anything to be recalled with some more familiar material. Thus dates may be represented by words by having certain consonants represent digits and then combining the letters into words and the words into sentences that can be readily remembered. Other systems make meaningless associations between two things to be re-

called together. It must be said of all of these devices that they require more time than the simpler methods ordinarily used. The best mnemonic system is the system of knowledge as developed in the sciences. There everything is arranged in an order determined by long use and the best intellects. It is a logical system, and for bits of knowledge that fall within it no better system can be devised. Mnemonic systems are of value only for irrational matter, such as the number of days in the months. W. B. P.

MEMORY MAPS.—Map drawing by the pupils, as an active mode of developing power to read maps, takes two forms (1) map copying and (2) drawing maps from memory. The drawing of memory maps as an exercise following the first stages of map reading and map copying is intended to give motive for additional map study. Inasmuch as it tests the knowledge of the child in an actual expressive test, the child returns to his study with a definite sense of defect which guides him to the facts he most needs to acquire. The inaccuracy of all memory drawing, if unaccompanied and unchecked by much map study and copying, would of course lead to the fixing of false notions and relations. For this reason, memoriter map reproduction by the pupils has often been vigorously opposed. Its weakness is apparent. Its value lies in its employment as a method of testing knowledge, preliminary to further careful study. H. S.

MENCIUS, MENGTSSE, or MUNGTSSE (371-287 B.C.). — Chinese philosopher named Chao Ch'i, or Second Holy One, and called by Martin the St. Paul of Confucianism. He studied under a grandson of Confucius and began to teach at forty. Although he had opportunities of holding important state positions, he preferred to travel and expound Confucianism. He seems to have been more outspoken and fearless than Confucius. The last years of his life he spent in retirement and formulated the philosophical work which is known by his name. Among the most notable of his tenets were the beliefs that human nature is originally good but deteriorates through evil environments; that humanity and righteousness are inherent in man's nature; that government is divine, but is intended for the people's good.

MENDOTA COLLEGE, MENDOTA CITY, ILL. — A coeducational institution, founded in 1893 and maintaining preparatory, collegiate, theological, commercial, musical, and correspondence courses. Admission requirements are fourteen units. The degrees of A. B., B. S., and D. B. are conferred. The enrollment in the collegiate department in 1910-1911 was only thirteen. The teaching staff consists of eleven members.

MENELAUS. — See GEOMETRY.

MENINGITIS. — The brain and spinal cord are inclosed by three membranes, or meninges, the pia, the arachnoid, and the dura. Meningitis is an inflammation of any one of these membranes, though the arachnoid is not subject to inflammation independently of the other membranes, while inflammation of the dura alone, external meningitis, or pachymeningitis, is only rarely encountered, so that meningitis is practically always an inflammation of the pia, whether of the brain (cerebral meningitis), or of the cord (spinal meningitis), or of both.

Internal meningitis, or leptomeningitis, inflammation of the pia, may take on diverse forms, may arise from diverse causes, and may present diverse symptoms. The two forms of chief interest are tubercular meningitis and epidemic cerebrospinal meningitis.

The cause of tubercular meningitis is the tubercle bacillus, and the affection is probably always secondary to a primary tuberculous

process elsewhere in the body. The disease is favored by a tuberculous or scrofulous diathesis, by bad hygienic conditions, and is sometimes a sequel of whooping cough or measles. The premonitory symptoms are headache, listlessness, insomnia, and constipation. The disease then breaks forth with symptoms of fever, vomiting, and a very severe headache, which occasions a peculiar and characteristic scream or cry. On account of the nature of the disturbance in the brain the disease has sometimes been called "basilar meningitis," and formerly "acute hydrocephalus" or "water on the brain." The prognosis is very unfavorable, and death usually occurs within three weeks. Though so fatal when once developed, its appearance may often be warded off, when suspected, by a regimen of wholesome food, warm clothing, and rest.

The several forms of non-tubercular and non-infectious meningitis, or simple acute meningitis, exhibit similar symptoms, without the prodromal stage. They may arise from an extension of other inflammations, e.g. otitis, brain abscess, or as complications of pneumonia, typhoid, scarlatina, and other fevers, possibly also from exposure to extreme heat or cold. The onset of the disease is sudden, its course rapid, and its termination usually fatal.

Epidemic cerebrospinal meningitis, also known as cerebrospinal fever, and popularly as "spotted fever," was first recognized early in the nineteenth century, when epidemics appeared in both Europe and America. There have been several severe epidemics since then, notably in Maryland in 1892, at Boston in 1896-1897, at New York City in 1905, and in Scotland and Ireland in 1907-1908. The epidemics are commoner in winter and spring. As to the mode of transmission of the disease we are not entirely clear: it is infectious, but not directly contagious, and appears to follow bad sanitary conditions, especially damp, sunless housing. Its cause is a microorganism, probably the *diplococcus intracellularis* of Weichselbaum, which invades the body through the mouth or nose. Epidemics could be prevented by prompt quarantine, maintained stringently during at least the first two weeks. All discharges from the mouth, nose, and ears should be disinfected. Children or teachers in the same house as the patient should not attend school until the case is terminated. The victims are mostly children and young adults, and the mortality ranges in different epidemics from 25 to 75 per cent, or even higher. According to Osler, the mortality in children under one year is 87.6 per cent. The onset of the disease is sudden, with vomiting, agonizing headache, chills, a rise in temperature, stiffening of the neck, with characteristic retraction of the head, and delirium, followed later by paresis, disturbances of various reflexes, stupor, and remitting fever. Rashes which appear about the fourth day have led to the name

"spotted fever." Pneumonia is a frequent accompaniment. Death usually occurs between the fifth and the eighth day. For those who recover, serious sequelæ are to be feared, particularly deafness, blindness, chronic headache, and affections of the joints. This disease has challenged the experts of two continents. The several serums elaborated in Europe proved ineffectual, but experiments at the Rockefeller Medical Institute led to the production of a serum from the immunized horse, which, when applied intraspinally by direct injection, has yielded remarkable results. This Flexner-Jobling serum was first tried on human beings in January, 1907. Up to 1909, tests with about 600 cases showed a reduction of the rate of mortality to about 25 per cent, while now there appears a further prediction that this serum will in the future render this dread disease less than one tenth as dangerous as heretofore. Of peculiar value is the fact that those who recover with the aid of the injections recover completely, there having been but eight instances of physical or mental impairment following 295 recoveries. G. M. W.

MENSTRUATION. — A periodic activity of the genital organs of the human female, characterized by a discharge from the uterus and Fallopian tubes, the menses, or catamenia. The theory of menstruation most commonly accepted considers this process as the second in a cycle of activities — constructive, destructive, reparative, and quiescent — which runs its course in the uterus and tubes.

The date of appearance of the first menstruation may range from the tenth to even the twenty-fifth year, but the years thirteen to sixteen embrace the large majority of cases, with the fourteenth the most common year, — 13.7 years being a probable average for American girls. There are on record, however, a few extraordinary cases of menstruation in infancy. Cessation of the menses, the menopause, is a similarly variable phenomenon, having been recorded at all ages from thirty to eighty, but commonly falling between the ages of forty-five and fifty-two. Both the establishment and the cessation of this function are gradual and characterized by irregularities.

In general, the irregularities of menstruation may be classed in three types. The flow may be deficient or suppressed (amenorrhœa); there may be excess or flooding (metrorrhagia); or there may be undue pain (dysmenorrhœa). The first may arise from pathological conditions of the genitals, or from chlorosis, anemia, strong emotion, worry, or bad regimen; the

second may arise from local mechanical causes or often from abdominal compression; the third may be congenital, local, or of nervous origin.

This variability of function makes sweeping generalization concerning the relation of school work and menstruation unwise. It is certainly true that some girls, blessed with sound physique and careful home care, can carry on their regular tasks without interruption. It is equally true that girls who suffer from painful periods, or who display pronounced irritability and emotional excitement, must during menstruation be treated as invalids, and be placed under a special regimen, with freedom from worry and from either physical or mental exertion. The publication in 1873 of Clarke's *Sex in Education* occasioned widespread discussion of the need of periodic remission of school work for girls. Despite the criticism of his book, few schoolmen to-day deny the desirability of safeguarding menstruating girls from overpressure, while most physicians have regarded the disabilities attendant on menstruation as sufficient argument against construction or even against coeducation. MENTAL ABILITY. — See ABILITY, GENERAL AND SPECIAL.

MENTAL ADAPTATION. — See ADAPTATION.

MENTAL ARITHMETIC. — The question as to the merits of the terms "mental arithmetic" and "oral arithmetic" is an old one. It is true that written arithmetic is quite as mental as any other kind, and that the opposite to written is oral. As between the two adjectives there is little choice, however. The words "mental" and "oral" have so long been used interchangeably to apply to that phase of arithmetic that it is not dependent upon written help that they have acquired a rather definite meaning, and seem likely to endure. Historically, the mental long preceded the written, but only in very simple problems, chiefly involving counting and easy addition. As soon as the writing of numbers was introduced, written arithmetic, or else the arithmetic of some form of the abacus, became practically universal. In Japan to-day a native shopkeeper will multiply two by six upon the soroban (see ABACUS); and such mechanical aids were not discarded in western Europe until the sixteenth century, and they are still universal in Russia. About the beginning of the last century mental arithmetic underwent a great re-

vival, largely through the influence of Pestalozzi in Europe and Warren Colburn in this country, in each case as a protest against the intellectual sluggishness, lack of reasoning, and slowness of operation of the old written arithmetic. For a long time the oral form was emphasized, in America doubtless unduly so; and this was naturally followed by such a reaction that it lost practically all of its standing. The question is being revived at present as to what are the fair claims of these two phases of the subject upon the time and energy of the pupil and teacher.

There are two points of view in the matter, — the practical and the educational or psychological, — and fortunately they seem to lead to the same conclusion. Practically a person of fair intelligence should not need a pencil and paper to find the cost of six articles at two cents each, or of five and three fourths yards at sixteen cents a yard. The ordinary purchase of household supplies requires a practical ability in the mental arithmetic of daily life, and this ability comes to the mind only through repeated exercise. As will be seen later, it is a fair inference from statistical investigations that a person may be rapid and accurate in written work, but slow and uncertain in oral solutions. Therefore, it will not do, from the practical standpoint, to drill children only in written arithmetic if we expect them to be reasonably proficient in purely mental work. On psychological grounds, too, the neglect of mental arithmetic is unwise. It is a familiar law that the memory is stronger with respect to a fact that is known in several ways (a convenient phrase, if not scientific) than for a fact that is known in only one way. A man who knows a foreign word only through the eye may forget it rather easily; but if his tongue has been taught to pronounce it, even though he be deaf, he can the more readily recall it. If, in addition to this, his ear has often heard it, he is the more strongly fortified, and if he has also often written it, by pen or by typewriter, there is this further chain that holds it to the memory. In other words, the greater the number of stimuli that we can bring to bear, the more certain the reaction. Arithmetic furnishes merely a special case of this general law. If a child could simply see $9 \times 8 = 72$ often enough, he would come to be able to write it in due time, even if he did not know the meaning. If in addition to this he knows the meaning of these symbols and recalls having taken nine bundles of eight sticks each and finding that he had seventy-two sticks, then the impression on the brain is the more lasting. If, furthermore, he has been trained to say "nine times eight are seventy-two" repeatedly, the impression is still stronger; and if he has repeatedly heard this statement (and here is one of the advantages of class recitation), he has a still further mental grip upon the fact. In other words, mental arithmetic in the form of rapid oral work, with both indi-

vidual and class recitation, is a valuable aid psychologically, to the retention of number facts.

There is, however, a danger to be recognized. A child tires more quickly of abstract work than of genuine concrete problems; problems, that is, that are not manifestly "made up," but that represent some of his actual quantitative experiences. It therefore follows that if five minutes of mental work produce a certain efficiency, thirty minutes will not produce six times that efficiency. If this mental work is valuable, how much time and energy should be allotted to it? It seems to be the experience of teachers generally that a little mental work, rapid, spirited, perhaps with some healthy, generous rivalry to add spice to the exercise, should form part of every recitation throughout the course in arithmetic. There will often be exceptions, but in general it is a pretty good rule to devote from three to five minutes daily, and sometimes much more time, to this kind of work. In this way a child never gets out of practice, save during the summer holidays, and the practical and psychological benefits can hardly be overestimated.

On the applied side there is no better test for the teacher's ability to adapt herself to her environment, educationally, than this; for the nature of the mental work varies with the school year, the locality, the related subjects in the course, and with many other factors. In general, however, it may be said that mental arithmetic offers the best means for correlating the subject with the pupil's other work, both within and without the school. To limit it to this field, however, would be an evident mistake, the work with abstract number demanding the major part of the time assigned to this feature. To acquire perfect mechanical reaction to a given stimulus much exercise is required, and for a child to think seventy-two when stimulated by the ideas 9×8 and 8×9 demands repeated practice, not merely in relatively few applications, but in a multitude of questions involving abstract numbers. Nor is this practice any more irksome than is the solution of the ordinary applied problems of the textbook, as any teacher knows. It was almost exclusively by this abstract work that Pestalozzi developed calculators of such ability with concrete problems as astonished those who visited his school.

There are two lines of work in mental arithmetic: (1) the concrete, in which the teacher has an excellent opportunity for correlation, for local color, and for stimulating the interest in the uses of arithmetic; (2) the abstract, in which the textbook may be trusted to furnish a considerable part of the material. Each must be cultivated, and ability in one does not necessarily mean a corresponding standard of ability in the other, although a failure in the abstract line must lead to a failure in the concrete. One leads to the acquisition of number

MENTAL DEFECTS

facts, the other to the ability to rationally use these facts in applied problems. D. E. S.

See ARITHMETIC; PROBLEMS.

MENTAL DEFECTS. — See MIND, DISEASES OF.

MENTAL DEVELOPMENT. — Strictly speaking, this term covers those changes in individual consciousness which occur in the course of experience. Infancy (*q.v.*) shows very little mental power beyond the few instinctive tendencies (see INSTINCT) which are inherited and the emotions (*q.v.*) which grow out of the instincts. From this point on (see CHILD PSYCHOLOGY and PSYCHOLOGY, GENETIC) characteristic changes appear in habit (*q.v.*), perception (*q.v.*), and all the other mental processes.

Wundt has summarized the principles of mental development in three general laws. The first law is that of mental growth, and sets forth the fact that in the course of development the individual creates new forms of experience. The second law sets forth the fact that the end of mental processes is continually progressing with the growth of experience. The third law states that there is a tendency for the mind to oscillate in its development between extremes.

The full discussion of the facts and principles of mental development involves all of the problems of education. C. H. J.

MENTAL MEASUREMENT. — It is usual, in experimental psychology, to distinguish between *direct* and *indirect* mental measurement.

Direct Mental Measurement. — To make a measurement is, in strictness, to compare a given magnitude with a conventional unit of

MENTAL MEASUREMENT

the same kind, and to determine how many times the unit is contained in the magnitude; the numerical result is the measure of the magnitude in question. The prototype of measurement, in all departments of natural science, is thus linear measurement in space. Here we have as datum a certain finite magnitude, a given length or distance; we have our conventional unit, mile or meter; and the homogeneity of space assures us that the given magnitude and the unit of measurement are of precisely the same kind. The procedure of measurement consists in the laying off of unit distances $0-1$, over and over again, upon the given distance, $0-x$, until the limiting point x is reached. To say, *e.g.*, that a mountain is 5000 feet high means that the unit of one foot may be laid off, 5000 times over, upon the vertical line extending from sea level to the summit of the mountain.

There can be no doubt that measurement of this elementary and direct kind is possible in psychology. Indeed, the history of astronomy furnishes an excellent instance of mental measurement that antedates by nearly two thousand years the establishment of the first psychological laboratory. The Greek astronomer Hipparchus (c. 130 B.C.), and after him the Alexandrian Ptolemy (c. 150 A.D.), classified over one thousand of the fixed stars in terms of their luster or brightness. The brightest stars form class 1, those just visible to the naked eye form class 6; the stars of intermediate luster are grouped in the intermediate classes 2, 3, 4, 5. And these six classes are sensibly equidistant; so that the interval of luster, the difference of brightness, between stars of classes 1 and 2 is equal for sensation to the interval or distance between stars of classes 3 and 4, or 5 and 6. In other words, the ancient astronomers had before them a certain mental magnitude, the range of luster from bright to dim, from the brightest star in their sky to the star that could but just be made out against its background; and they measured this range or distance by dividing it into five equal unit distances. The given magnitude $0-x$ is changed, by measurement, into the series $6-1$; it contains the unit of measurement, the conventional class difference or class interval, five times over. The arrangement into six classes was dictated, we may suppose, by superstitious reasons, the arrangement itself is an essay in mental measurement.

So far, however, we have no means of giving an objective expression to these estimates of mental interval; for that we must await the advent of stellar photometry. Physical measurements of the luminosity of the fixed stars show that the light intensities of the six classes form, in ascending order, a rough approximation to a geometrical series, with an exponent of 2.5. This result tells us two things: first that the mental measurement was fairly accurate; the unit of brightness-difference, though not

exact, is approximately the same at all parts of the five-unit scale; and secondly, that brightness-differences which are absolutely equal in sensation correspond to differences of physical light intensity that are themselves not absolutely but relatively equal. (See WEBER'S LAW.) These points may be further illustrated by reference to experiments made by Ebbinghaus in 1887; the problem was to pick out a series of eight equidistant brightnesses from a set of fifty papers that had been washed over with various amounts of Indian ink; and the quotients of the successive pairs of (photometrically measured) stimulus values were:—

2.3, 2.1, 2.1, 1.8, 1.7, 1.7, 2.0.

Here, again, is an approximate constancy of physical result, a constancy as great as could be expected from the limited material of observation; and here, too, is confirmation of the validity of a mental measurement.

It is clear from these examples that a direct mental measurement is possible in all cases in which the subject matter of psychology takes the form of a homogeneous continuum. This state of affairs is realized, certainly, for various departments and for sundry attributes of sensation; for the intensity, and perhaps for the quality of simple feeling; and, probably, for degree of attention. No more can, at present, be said. Simple as the principle of mental measurement is, the actual measuring is exceedingly difficult: the investigator must, first, set up a workable and as it were objective unit of measurement, and must then follow a rigorous method and eliminate many sources of error in his attempt to lay off this unit upon the magnitude to be measured; the whole object of measurement is, after all, to carry accuracy into spheres of scientific research in which unaided observation, bare estimation, is inaccurate. So far, therefore, direct mental measurements, despite their importance for the theory and system of psychology, have been made only in a comparatively narrow field.

A question which the author has often been asked, and which it may be worth while to answer here, is this: What is the difference between, say, the Ptolemaic classification of the stars and the sorting into groups of a number of examination papers in history, on the basis of equal differences in percentage of "marks"? The difference is that the classification of stars rests on sensed equality of brightness interval, whereas the grouping by marks assumes that the writer of a paper marked ninety excels in ability the writer of a paper marked eighty just precisely in the same degree that the writer who is marked sixty excels the writer marked fifty. There is evidently no warrant for this assumption, the marks could be used as indexes of mental measurement only if we had already established, by some other means, an unit difference of ability in history. It may be added that, so far as we can now see, the establishment of such an unit must be a matter of indirect, not of direct, mental measurement.

Indirect Mental Measurement.—The great majority of the numerical results found in textbooks of experimental psychology repre-

sent what is called "indirect" mental measurement. They are numerical expressions for the physical antecedents or consequences of consciousness; that is to say, for stimuli or organic movements; they state the physical intensity of a light or sound, the length or direction of a line in objective space, the force or extent of a voluntary movement, the objective duration of a mental event, the number of stimuli simultaneously presented to an observer, and so forth. They fall under our present heading because their interest and relevance are always and wholly psychological; they are determined for psychological reasons, and have no value beyond psychology. In many cases they are necessary to the completeness of a direct measurement. Thus, we have seen that a certain range of luster or brightness, that of the fixed stars visible to the naked eye, has been divided by astronomers into five equal intervals or distances. If, however, we wish to measure directly the whole extent of sensible brightness, from its absolute minimum to its absolute maximum, we must find out, under the most favorable experimental conditions, what duller and what brighter lustres can still be distinguished; we must determine, photometrically, the light values of the liminal and terminal brightnesses, the end points of our sensible scale; and we must then apply our chosen unit of measurement over the entire range. The fixation, in terms of stimulus, of the extreme points or positions of the sensory scale is a necessary preliminary to a complete direct measurement.

The scope and value of indirect measurement can, perhaps, be shown best by illustration; there is, in fact, no department of psychology that has not benefited by it. Thus, in the field of visual sensation, it is important to obtain color matches or color equations both for color-blind and normal eyes, and also for the normal eye at various stages of adaptation: these equations are recorded in terms of photometric intensity and wave length. The influence of visual contrast may be measured as follows. a stimulus *a*, which shows the effect of contrast, is equal to a stimulus *b*, which is exempt from contrast; *a* is then removed from its surroundings, and the difference between the free *b* and the free *a*, expressed in physical terms, measures the change which *a* suffered under the conditions in which contrast was operative. The same principle is employed in the measurement of optical illusion, that is, of the apparent change in the direction or extent of lines that form part of certain geometrical figures; a perfect square, for instance, seems to be higher than it is broad. The degree of blending of simultaneous tones is measured by the percentage of cases in which the auditory perception fails of analysis, *i.e.* in which two tonal stimuli are apprehended as a single tone. The temporal limits of the perception of rhythm, *i.e.* the slowest and fastest rates at which

rhythm is perceived, and the limit of complexity of the rhythmical unit, may all be established by reference to the rate and number of the recurrent stimuli. The range of attention is measured by the number of separate stimuli whose perceptions are clear and focal in consciousness at one and the same time; the duration of attention by the length of time during which a perception can maintain its focal position. A great deal of quantitative work has been done upon the function of memory: thus, the number of readings of a given material, necessary under various conditions for faultless recitation, indicates the most economical method of memorizing; the number of new readings required for recitation, after different intervals of time, gives an inverse measure of the decay of memory; and variations in the nature of the material itself, in the emphasis which different parts of it receive, in the rate of its assimilation, in the amount presented at a single sitting, in the temporal distribution of these sittings, — variations of this kind yield each one its own numerical results, which further our understanding and control of memory at large. The reaction experiment (*q.v.*), in which we measure the time elapsing between the exhibition of a stimulus and the performance of a responsive movement, serves a number of psychological purposes; in the simple reaction, variation of the modality, the quality, the intensity of the stimulus brings about characteristic differences in the length of the reaction time; and in the more complex forms of the experiment we obtain a temporal measure of discrimination, association, choice, even of the act of thought itself. Indeed, in this sense of indirect measurement there is no type of psychological experiment that may not be given a quantitative form. the growth and tenacity of habit, the onset, course, and degree of mental fatigue, the acuity of sense perception, the degree and constancy of emotive arousal, the laws of retention, association, and reproduction, the delicacy and regularity of voluntary movements, these and a hundred other things of like character may now be expressed in numerical terms. And it is plain that indirect measurement, while it has not the theoretical importance that attaches to a direct measurement of mind, is yet of very great practical importance. Studies of the speed and extent of eye movement, coupled with studies of relative legibility as dependent on letter form, spacing, etc., not only give us a psychology of reading, but also suggest rules for the make-up of our books and newspapers; the study of the movements of writing leads to similar practical results; the precepts of school hygiene are largely based upon norms furnished by psychological experiment; and the exact psychological study of attention, retention, and association supplies us with tests of the drawing power of an advertisement, of a man's special aptitude for some form of skilled labor,

of the reliability of a witness, even of the criminality of an accused person. It is true that these tests cannot be applied indiscriminately; it is true, also, that many, perhaps most, of them have not yet been perfected; applications of psychology are still in their infancy. Nevertheless, the widespread interest now taken in questions of practical application proves that experimental psychology has done well to multiply and refine its methods of indirect measurement.

In conclusion, mention must be made of the measurement of correlation, a line of work which dates from the beginning of the present century, and which has steadily gained in favor. Correlation may be defined as a tendency toward concomitant variation on the part of two or more mental traits or mental abilities within a group of individuals. Provided that the group is well defined and its environment uniform, the result of a measurement of this tendency may be transferred from the group to the individual, and may then be regarded as measuring the closeness of connection of the traits or abilities in the particular case. An observed correspondence may be due either to an actual interrelation of the characters under investigation, or to the influence of the common environment. Both cases are of psychological import, as throwing light on the constitution of mind, on the relative influence of heredity and education, on the Mendelian doctrine of the unit character, etc.; and both have an evident bearing upon educational problems. MERCER UNIVERSITY, MACON, GA.

— Established in 1829 as a classical and theological school for prospective ministers only, combining agricultural labor with study. In 1832 other students were admitted. The university charter was obtained in 1837. Until 1871 work was carried on at Penfield, Ga. The following schools are maintained: arts, law, pharmacy, and summer. The entrance requirements are fourteen units. The degrees of A.B., A.M., LL.B. (on a two years' course), Bachelor of Pharmacy (two years), and Master of Pharmacy (Ph.B., and Ph.M.) are conferred. The enrollment in 1910-1911 was 368. The faculty consists of thirty-one members.

MERCHANT TAYLORS' SCHOOL, LONDON, ENGLAND.

— One of the nine Public Schools of England. It was founded in 1560-1561 by the Merchant Taylors Company of London "for the better education and bringing up of children in good manners and literature." The school was located in the parish of St. Lawrence Poulteney. The statutes were framed on the model of those of St. Paul's School. The number of scholars was limited to 250, and there were to be appointed a high master, chief usher, and assistant usher. Richard Mulcaster (*q.v.*) was the first headmaster, and the school, when opened in September, 1561, at once sprang into popular favor. Unlike most other public schools, Merchant Taylors' School was and has always remained a day school. Through the munificence of Sir Thomas White, a member of the Court of the Company, thirty-seven fellowships at St. John's College, Oxford, founded by himself in 1557, were established for Merchant Taylor scholars, thus linking the school with a college in the same way as Eton and Winchester had their respective affiliations at Cambridge and Oxford. The school under Mulcaster was highly successful; one of the most illustrious of the alumni was Edmund Spenser; in addition to the general classical and religious curriculum, he encouraged music and acting, and companies of the boys performed plays and masques before the Queen (1573, 1575, and 1583). With this feature of school life Merchant Taylors' was long associated, particularly in the eighteenth century. The salary of the headmaster, however, was and for long continued to be so small and the restriction on numbers so rigidly adhered to that Mulcaster resigned in 1586. With the development of the school may be traced the rise of the examination system in England, the first visitation of the diocesan being made in 1562 (see EXAMINATIONS). During the Civil War the school appears to have been royalist, and many of the alumni, risen in not a few cases from "poor scholars" to bishoprics, were strong defenders of the Anglican Church. The Great Fire of 1666 practically destroyed the school, but fortunately the library, which was maintained by gifts of books from the members of the Com-

pany, was saved. A new building was erected in 1675. The curriculum of the school continued to be classical until the beginning of the nineteenth century. In 1828 mathematics began to be taught regularly; in 1845 French was introduced as an extra and as a regular subject in the following year; modern history was added in the same year (1846), and in 1856 drawing appeared. The school has always encouraged the study of Hebrew, and is one of the few places where it is still retained. In 1861 an opportunity of moving to more spacious quarters was afforded by the purchase of the Charterhouse buildings. The change was not effected until 1875, and the increased accommodation permitted a doubling of the numbers. The school is divided into classical, modern, and special (mathematical and science) sides, and facilities are offered for the study of chemistry, physics, and biology, so that pupils taking these subjects may shorten the normal medical course by six months. The school is mainly a day school, boarders being received only by special arrangement. The number of boys in the school is 500.

MEREDITH, GEORGE (1828-1909).

— The English novelist was born in Hampshire, England, and up to fifteen years of age was at school at Neuwied in Germany. He began, but soon abandoned, law, and took to journalism, and in 1866 acted as correspondent to the *Morning Post* during the war between Italy and Austria. In 1867 he acted in place of John Morley as editor of the *Fortnightly Review*, and became literary adviser to Messrs. Chapman and Hall. Meredith published *Poems* in 1851, and throughout his life continued to write poetry which placed him in the first rank; but it is in his novels that he presents the most strongly marked relations to the interests of theoretical and practical education. In 1856 *The Shaving of Shagpat* appeared, cast in the form of an Oriental allegory. The story traces the educative power of circumstances and the disciplinary effect of the world's "thwacks." In 1859 Meredith published *The Ordeal of Richard Feverel*, in which he insists that the parent as educator must arouse and help the directions of activity of the child's own mind, must encourage the development of the child's independent individuality; and this he urges as graphically as any specialist educator. In-

MERIT SYSTEM

stead of writing a disquisition, like Rousseau, to show the virtue of judiciously leaving the boy alone, Meredith traces dramatically the consequence of interfering with a soul, even by a father with his son's. The work becomes the scene of a great educational experiment, from which springs up the conviction of the necessity of freedom from system and spontaneity of development in all true education. In *Evan Harrington* (1860) and *Rhoda Fleming* (1865) are further studies of boy and girl training respectively, and in the *Egoist* (1879) is developed the tragedy of the attempt to dominate the personality of the lover, as Sir Austin Fevrel had attempted in the case of his son. In 1894 came *Lord Ormont and his Aminta*, which may be called Meredith's schoolmasters' novel, in which he places Matthew Weyburn's ideal school, under the joint direction of himself and his wife, by the side of a Swiss lake, where swimming and physical exercises of the Swiss mountains and valleys are as natural as meals. Boys of all nationalities are welcomed, and cosmopolitanism becomes at once an aim and a method of education. Coducation of the sexes receives the impress of the natural environment of Switzerland, and education appears as the entry into a large-hearted, large-minded, healthy, vigorous life, with infinite riches of various personalities. F. W.

MERTON, WALTER DE (d. 1277).—English divine and statesman, at one time chancellor under Henry III, and Bishop of Rochester. Educationally Merton is of note as the founder of the first college at Oxford, which became the model for all future colleges at Oxford and Cambridge. In 1264 he formally assigned two manors, at Farleigh and Maldon in Surrey, to be held for the establishment of a "House of the Scholars of Merton at Maldon" with power to maintain twenty scholars at "Oxford or elsewhere where a university may happen to flourish." In 1270 Merton College was definitely and permanently moved to Oxford, and new statutes were issued in 1274 by the founder, who also provided, if necessary, for the primary education in rudiments of orphans of his kin up to the number of thirteen.

MESMERISM

MESMERISM.—A theory propounded by Mesmer (1734-1815), the practices which he popularized, and the interpretation of the phenomena presented. The name given by Mesmer to his doctrine was "Animal Magnetism." He assumed the existence of a "universally diffused subtle fluid, . . . affecting the animal economy by insinuating itself into the nerves." It has properties like the magnet, may be transmitted, and "will cure nervous diseases directly and others indirectly by provoking salutary crises, thus bringing the art of healing to perfection." The theory was presented dogmatically, and fantastically affected his practice. He began by applying a magnet to the affected part, then in Paris (1778-1784) constructed the "baquet," or tub, filled with iron filings and other paraphernalia suggestive of some magnetic force, about which sat the patients, drawing from it and from Mesmer's passings and strokings the curative "force"; but in the end he announced that the "magnetism" was concentrated in his own person, and that he could impart its virtues to a glass of water or other inert substance. It is to this form of the theory, as a force emanating from peculiarly endowed individuals, that the term "Mesmerism" came to be attached.

Mesmer's practice was affected by the medical theory that diseases must run their course and reach a crisis; the manipulations and the "magnetic force" precipitated the crises, which, as they receded, left the patient cured. These crises, frequently taking the form of a hysterical attack, were the common symptoms at the exciting scenes enacted in the *salle des crises*; yet the accounts show that the strokings and passes and suggestions—not unlike the "touch" for the king's evil and the methods of exorcism and faith healing—drove away pains, paralyses, and invalid impediments. Mesmer doubtless induced alterations of consciousness and hypnotic suggestibility, but quite ignored their significance. It was the Marquis de Puységur, a disciple of Mesmer, who, in 1784, called attention to the altered psychological state of the subject; to the fact that the subject was responsive only to the verbal suggestion of the operator and recalled nothing of his experiences when awake. To this altered condition he gave the name of "artificial somnambulism," correctly recognizing its analogy to the sleep-walking state. Puységur discarded the "mesmeric" theory, and became the first hypnotist. It remained for James Braid in 1843 to demonstrate the physiological reality of the condition as an altered disposition of the nervous system depending upon some peculiar susceptibility of the subject; to this condition he gave the name of *hypnosis*. The rôle of suggestion was recognized, and made possible the scientific study of abnormal psychophysiological consciousness and control—or, more exactly, the

revival of it — in the latter decades of the nineteenth century. (See *HYPNOSIS*.)

Viewed historically, "mesmerism" becomes an antecedent of hypnotism; and the vicissitudes of its career form a complicated story, in which false and misleading views growing out of mysticism, of faulty observation, or of leaning toward occult or supernatural beliefs obscure issues and thwart profitable insight. Mesmer's obstinate controversies with investigating commissions, the one referring the observed phenomena to the action of a "fluid," and the other to imagination; Puységur's *somnambules*, quickly degenerating to second-sight diagnosticians and readers of sealed messages; Braid's entanglements with phrenology, — these and other phases left their impress alike upon the prejudices and the legitimate demands of the medical profession, and made the transition from "mesmerism" to "hypnotism" a difficult and circuitous process. The convincing data were, in the early stages, the anæsthetic state, permitting serious surgical operations to proceed without pain; and in the later stages, the orderly interpretation of psychological phenomena under the leadership of men like Charcot, of established scientific reputation. With the establishment of the genuineness of the hypnotic state and of its interpretation as due to the nervous susceptibility of the subject, the scientific attitude was secure; and the notions attached to "mesmerism" as an objective "force" were wholly relegated to an historical significance alone.

METAPHYSICS. — The name "metaphysics" as designating philosophy or some one of its branches arose from a misunderstanding of an accidental way of describing certain writings of Aristotle; namely, those coming after the physics. This was shortly taken to mean the

things that lie beyond the physical, that are above the natural — a conception which medieval thought identified with the supernatural. This long remained the popular signification, so that Shakespeare, for example, refers to ghosts as metaphysical.

Aristotle himself in the body of his treatise supplied some grounds for identifying his discussions with theology. His formal designation is first philosophy, and this he says has for its object a descriptive definition of being as being, or existence as existence. Each branch of science considers the traits of some set or class of existences; but no science considers the traits that all existences alike possess. Hence they leave room for and indeed require a more general and formal science to take up the matter they leave untouched. So far there is no ground for referring first philosophy, or metaphysics, to anything transcending the subject matter of the sciences. But in the course of his discussions, Aristotle is led to discriminate grades of being and to conclude that only pure actuality, or God, is completely real, or can be said to *Be* without qualification. Hence metaphysics appears as a science of the highest and more real mode of Being.

Throughout the eighteenth and earlier nineteenth centuries "metaphysics" was loosely used to denote inquiries concerned with mind, what would now generally be called psychology; and also to denote any inquiry of an ultimate sort. In the later sense it was generally divided into ontology, or inquiry into Being, and epistemology, or inquiry into the nature and limits of knowing. At present, there is a tendency to revert to the more limited Aristotelian sense, though the term is still widely used as a generic name to cover all sorts of inquiries that do not seem to fall within the scope of any of the positive or mathematical sciences.

METHOD. — The topic of method represents one of the three typical phases of educational practice, the subject matter of study and the institutional agencies of education being the other two. As in the case of subject matter (see COURSE OF STUDY, THEORY OF), there are important practical matters at issue and also general philosophical considerations. The former is the field of methods (in the plural number), the ways of teaching special subjects in accordance with principles that successful experience has vindicated — often called "Special Methods." The latter centers about the problem of the relation of mental attitude and operation to subject matter. For

reasons that will appear in the sequel, this problem passes into that of the relation of the individual self to the objects of the world and social life. Intermediate between the field of specific practices and the one of general theory is the logical question of an underlying uniformity of method in the application of mind to various subjects whether pure mathematics, the natural sciences, or history, literature, and language. This intermediate question usually goes by the name of "general method." The present article is confined to the distinctively philosophic aspect of method, extending the survey, however, to take in those phases of general method that are closely connected.

In a general way method is the obverse and correlative of subject matter. The proper interpretation of the connection and distinction between the two is, however, by no means evident, especially since it has been complicated and to some extent perverted by the pervasive influence of a dualistic philosophy. (See DUALISM.) Mind has been severed from the world; the individual from society and its growth. The two have not only been divorced, but the separation between them has been intensified to the point of complete antithesis. (See HUMANISM AND NATURALISM; and IDEALISM.) All effective knowing and acting involve, moreover, both the mind in the world and individual agency in social conditions and for social aims. Hence, the more the separation is emphasized, the more urgent becomes the question of the possibility of interaction and reciprocal influence. While the distinction of subject matter and method was never sharpened into such extreme opposition as that just indicated, the dualistic antithesis of mind and the world affected men's ideas of these educational subjects. The problem of method was conceived as the problem of the adaptation of an individual mind to a foreign subject matter; as an affair of bringing together two things that naturally and intrinsically have nothing to do with each other. This background influenced the conceptions of discipline, culture, and interest (*qq.v.*). Even where the extreme dualism of mind and the world, self and social institutions, has been professedly surrendered, it is not uncommon to see questions of method of teaching, study, and moral training discussed as if they were essentially matters of adaptation of one thing to another unlike thing. How may the study in question be presented to the mind so as to appeal to it? How may the mind be aroused so as to apply itself to this topic, naturally alien? Such ways of conceiving, in the concrete, the relations of subject matter and method indicate the intellectual atmosphere in which the discussion of mental operation and application has been bathed.

An analysis of experience shows, however, that experience is not a combination of subject matter and method, or an interaction of two independent factors, one of which supplies

content and the other form. The distinction between these two matters is developed within experience itself, and arises for the sake of greater control of the course of experience. As indicated in the article on experience (*qv*), experience has a dynamic and a static aspect, one of transition and one of cumulation, of retention. Experience, that is, is always changing, and yet it is not a mere flux. There is always a somewhat that changes, and its transition is not a mere passing away, but is a transformation. Here we have the root of the distinction between content and form, subject matter and method, object and subject. It centers in the distinction of the *what* and the *how* of experience. *What* we experience varies in quality, in value, significance. The transition from one state to another is, therefore, measured by the content it ushers in, while the presence and appreciation of this or that object depends upon the factor of transition. In order to secure the objects that are of positive or greater value and to avoid the objects that are of negative or lesser value, we must control the processes of change by which one content of experience gives way to another and grows into it. Whatever in experience, accordingly, aids in control of its development so as to attain what is desired and exclude what is not wanted, is method, way, form of experience. The objects and subject matters that are influenced by this control constitute the material, the structure of experience.

In the course of an infant's restless activity, light is felt and enjoyed. The light, however, is more or less submerged in the qualities that attend the moving of the head, the arms and hands, and certain intraorganic processes. It is, therefore, a vague and confused object, lacking distinctness. In subsequent experience, it is found by accident (that is, without deliberate effort or conscious intention) that the enjoyment of the light quality — such as it is — coheres with changes of the head, eyes, and position of the body, these qualities not having the value attaching to them that the light quality has. As soon as this connection is apparent, the light acquires the status of an *object*, of material or content; while the qualities of the movements of organs of the body in losing their primary values are reduced to the status of means or agencies for getting the object. Thus occurs the gradual differentiation of object and subject, matter and method. The subject matter does not, however, always present itself as an end to be secured; movement in the desired direction may be impeded by certain contents. These resisting factors then stand out conspicuously as obstacles, hindrances. They also become objects, part of the subject matter of experience, for it depends upon the way they are worked upon whether the desired end is ushered in or not. It should be noted that the distinction between matter and method, material and way of treating it,

METHOD

is not a rigid one. What is subject matter at one time may be a part of method at another, and *vice versa*, according as it functions in a concrete situation. In concrete experience it may happen that the sound quality is the significantly desirable thing and that the light or color quality is of import only as clew or stimulus to the presence of the sound as end. Then the seeing reduces itself to the status of means, agency, method. It falls on the side of the subject, no longer on that of the object.

Two things then characterize the concept of method. Methods with respect to their origin mark the gradual differentiation of certain elements of experience; and, with respect to their function, represent any attitudes and operations that are employed to give the course or sequence of experience a direction that is desirable. Method at bottom is but the way of doing things followed in any given case. Its psychological counterpart is the habits and habitual attitudes that determine the course of experience. It follows that methods are at first formed by a semi-instinctive process of trial, error, and success, and that they operate very largely unconsciously. That is to say, attention is given primarily to the ends and obstacles involved, and the habits respond more or less spontaneously to the idea and perception of these objects.

At this point a serious error is often made in the conception of educational method. Just because these primary ways of doing things which represent method at its primary and deepest level have been formed in relatively accidental fashion and also prior to the period of conscious school instruction; because, moreover, they often mark relatively ineffective and blundering ways of accomplishing ends, there is a tendency to ignore them or to deny that they are methods at all. Method is then conceived as a purely logical matter, in a sense that identifies the logical with a consciously formed and followed enterprise. Such methods are embodied in symbols, and need not be embodied in working attitudes and habits at all. They are formulae for ways in which things consciously ought to be done, not descriptions of the ways in which they *actually* are done. Thus a complete split is introduced between what are called psychological methods (but which might better be termed vital, concrete, or practical methods) and the so-called logical methods — which might better be termed formal and symbolic. The result is that new habits which are largely verbal are grafted on to the older working habits — generally to the detriment of their efficacy; or else, in reaction from the futility of mere formulations of logical abstractions, the spontaneous, habitual attitudes are relied upon, without securing the readjustment and reconstruction needed for higher and more complex ends — for securing a better type of control.

The fundamental question of method in edu-

METHOD

cation thus concerns the right coöperation of the unconscious and the reflective factors in the direction of the course of experience. Method, the way of going at a thing, depends at first upon the relation between instinct and desire, on one side, and an end, on the other. The end stands out more or less in consciousness and supplies the basis of conscious guidance. What is educationally important is, therefore, that on one side the proper type of desire be aroused and the proper type of end be conceived on the other. These points are not matters of conscious formulation, but of providing enviroing conditions that will call out and fix desirable attitudes of response. Only as these attitudes become sufficiently habitual to be effective is there any basis for conscious reflection so as to formulate methods for further conscious employment. When, as is too frequently the case in such subjects as arithmetic and grammar, teachers insist that pupils shall consciously follow certain forms of statement and "analysis" before they have become thoroughly habituated to dealing practically with the situations in which numerical and grammatical values occur, the result is that the formulae come between the pupils and their appreciation of the nature of the situation. They do not respond any longer to the results of the experienced situation, but only to the verbally acquired formulae. The very means that are supposed to render the pupils' operations more intelligent, more logical, result in making them mechanical.

Logical method, in short, as a conscious procedure always implies reflection upon the means which have already been instinctively and hence unconsciously used in reaching ends that make an appeal on their own account. Formulated logical operations are thus the possession of an expert in a subject, one who has already worked through the subject, and who has, therefore, command of the materials to be formulated. They represent the standpoint of a matured, a developed, experience. The commonest school fallacy is that the methods which represent the control of a subject matter gained through long practical experience can be conveyed directly to those who are just beginning to occupy themselves with a topic, so that the procedure of the latter may be made more reasonable and intelligent. Many methods that are condemned as "deductive" are really not deductive at all, but simply represent the attempt to hand over directly to the inexperienced and immature the intellectual technique appropriate to those who have gone through a subject, and who are therefore in a condition to review and systematize the procedures that have proved effective.

The currency of the wrong conception of logical method leads to a reaction almost equally harmful. Considerations of order, sequence, definiteness, of fit adaptation of means to ends, the importance of thoughtful surveys and re-

METHOD

views of ground traversed, together with the need of formulating the practices that have been found helpful, are ignored. Behavior is left on the instinctive or "spontaneous" plane with no care to see that the attitudes that are evoked are those most adequate to their direct end, and also such as to stimulate later reflection. The true difference is not between the merely psychological -- the illogical -- but between the unconscious logic of effective adaptation to ends and the conscious logic of formulating the methods that have been successfully employed, so that subsequent procedure may be easier and more fruitful. And this transition, through reflection upon that which has been already accomplished, from the blinder and more instinctive into the more intelligently controlled, should be a constant factor of all growth; it is, indeed, indispensable, if growth is to be truly educative. (See EDUCATION)

From this conception of method there follow certain considerations applicable to the topic of general method. Strictly speaking, method is thoroughly individual. Each person has his own instinctive way of going at a thing; the attitude and the mode of approach and attack are individual. To ignore this individuality of approach, to try to substitute for it, under the name of "general method," a uniform scheme of procedure, is simply to cripple the only effective agencies of operation, and to overlay them with a mechanical formalism that produces only a routine conventionality of mental quality. Certain features may be found, however, which are involved in the transition from unconscious effort to a more consciously guided process. These features may be abstracted and generalized. While the outcome will not put individuals in possession of a sure key to intellectual efficiency, it will indicate to a teacher the main steps that have to be taken, and suggest the crucial points where conditions of growth have to be carefully maintained and fostered.

The primary factor in general method, so construed, is the existence of a situation which appeals to an individual as his own concern or interest, that is to say, as presenting an end to be achieved, because arousing desire and effort. The second point is that the conditions be such as to stimulate observation and memory in locating the means, the obstacles and resources that must be reckoned with in dealing with the situation. The third point is the formation of a plan of procedure, a theory or hypothesis about the best way of proceeding. The fourth is putting the plan into operation. The fifth and last is the comparison of the result reached with what was intended, and a consequent estimate of the worth of the method followed, a more critical discernment of its weak and its strong points. These five steps may be reduced to three more generic ones. The first and fundamental condition of right method is the existence of some concrete situation involv-

METHOD WHOLE

ing an end that interests the individual, and that requires active and thoughtful effort in order to be reached. The second is consideration of the nature of the problem, the difficulty or perplexity involved in reaching the end set, so as to form a suggestion or conjecture as to the best way of proceeding to solve the difficulty. The third is the overt effort in which the thought of the plan is applied and thereby tested. Scientific method will be found to involve exactly the same steps, save that a scientific mode of approach implies a large body of prior empirical and tentative procedures which have finally been sifted so as to develop a technique consciously formulated and adapted to the given type of problem.

METHOD READERS -- In teaching beginners to read two methods are employed. One group of teachers makes no systematic attempt to deal with phonetic and spelling difficulties, but emphasizes the thought. Their units of treatment are the word, phrase, and sentence. The materials used are therefore selected from the child's spontaneous usage, children's classics (such as Mother Goose), and the best suitable English literature. Artificial content and form are omitted from the beginning. Another group of instructors contend that the main function in teaching beginners to read is to give them a mastery of the mechanics of pronunciation and spelling. Hence these emphasize the phonetic difficulties in translating visual symbols into sound. They stress units smaller than the word -- the letter, diphthong, syllable, and phonogram. Their reading material is consequently selected with reference to the systematic control and graded presentation of phonetic elements. The primers and readers used by them have a systematic plan or method, hence such reading books are called "method readers" to distinguish them from the so-called "thought readers," which emphasize interesting content rather than phonic elements. H. S.

See READING, TEACHING OF.

METHOD WHOLE. -- So much of the subject matter of any school subject as is sufficiently related to be treated as a teaching unit. A method unit or whole is usually treated in a series of lessons. It is exceptional for a method whole to coincide with the limits of a single lesson period. H. S.

METRIC SYSTEM.—A system of measures invented by the French at the close of the eighteenth century, although suggested in part as early as 1670 by Mouton, a priest of Lyons. It is based upon the theoretical average distance from the equator to the north pole. The measurements upon which this average was based have since been shown faulty, so that the standard of length, the meter, is not exactly one ten millionth of this distance, as was contemplated. This has no effect upon the validity of the system, however, since the standards were deposited in the archives at Paris and serve us as a basis for making copies. From the meter came the unit of capacity, the liter, which is a cube that is 1 meter on an edge. From this came the unit of weight, the weight of .001 liter of water at the temperature of greatest density.

The advantages of the metric system over the English and other earlier ones lies in the fact that it is constructed on a decimal scale, like that of United States money. The tables are given in most arithmetics, together with information showing the relation of the metric to our common system, and hence they need not be repeated in this article.

The system was not immediately adopted in France, and, indeed, was not made compulsory until 1837. Even to-day the pound (livre) is still used in small commercial transactions, but it is now taken to be one half of a kilogram. Thus in the home of the system the adoption was slowly made, and the usages of the people have remained to a certain extent. A large number of other countries adopted the system during the latter half of the nineteenth century, so that to-day it is the only international one. The English-speaking countries have, however, declined to look upon it with favor. This may be because of the lack of a centralized power to impose it upon the people, or it may be due to a general feeling of independence on the part of the Anglo-Saxon, but at any rate the movement has been very slow among the people as a whole. Among scientists, however, it has been well received, and between 1875 and 1900 it replaced the old system in the scientific laboratories of the colleges and secondary schools of the United States, and became looked upon as the international scientific system.

Educationally the question arises as to its status in the school curriculum. It is easily taught, and could be put into any grade. The

direct need for it does not arise, however, until the pupil studies some branch of science in which it is used. The time, therefore, depends upon the course of study. If elementary physics is taken up in the eighth school year, this is an appropriate place for the system.

There is the larger question as to the prospects of the use of the system by our people. There are two factors to be considered: (1) the simplicity of the tables; (2) the demands of foreign trade. It is impossible to say what the effect of these two factors will be. It is certain that we have, in the United States, greatly reduced our old system in a generation past. Compound numbers are now practically used to only two denominations, the decimal divisions of the mile, acre, and so on, having replaced them. We are therefore decimalizing our units, and this removes to a certain extent the need for the metric system. The question of foreign relations is more serious, because the United States has come to make a strong bid for foreign trade, and is manufacturing for that trade. How much effect this will have upon the introduction of the metric system no one can foresee. It does not seem the business of the school to attempt to influence the development further than to show the advantages of the system, and to prepare the pupil for the work in physics. When the need arises for learning it, any one can acquire it in a short time.

MEXICO, EDUCATION IN.—Mexico: Federal republic consisting of twenty-seven states, three territories, and the Federal District; area 767,323 square miles; population (census of 1910), 1,506,327.

Historical.—The history of public education in Mexico is distinguished from that of the other Latin-American countries by the fact that the Spanish conquerors of Mexico gave evidence of a real appreciation of the importance of public instruction for the masses of the people. In the countries of South America, especially in the Argentine, Chile, and Peru, such attention as was given to public instruction was concentrated on secondary and higher instruction. In these countries, under the leadership of the Church, university instruction reached a relatively high degree of development, whereas primary education was neglected.

This early zeal of the Spanish conquerors for primary education in Mexico did not last long. The enlightened policy which characterized the early period soon gave way to the same indifference to public education which characterized Spanish policy in the other countries of the American continent. As early as 1532 the Spanish authorities had made provision for elementary instruction for one thousand pupils in Mexico City. Unfortunately, trustworthy figures as to the size of Mexico City at that time are not available. If we bear in mind, however, that the Spanish authorities had to deal with a

distrustful and even antagonistic native population, we can appreciate the difficulties involved in bringing one thousand children under the influence of the Spanish schools.

Coincident with the opening of the University of Mexico in 1553, there is evidence of a marked decline in the interest in and zeal for elementary instruction. The attention of the government, as well as the funds available for public education, were diverted from primary to higher education. Soon after the middle of the sixteenth century Spanish policy in Mexico begins to conform to the traditional policy of Spain; namely, the neglect of primary education, combined with a relatively advanced development of university instruction. The result of this change was the total neglect of the real needs of the native population, inasmuch as the university courses in theology, civil law, canon law, and medicine were intended exclusively for the sons of Spanish residents. It is true that in the newly founded university a number of courses in the native languages were given, but these were intended to prepare Spanish priests for missionary work among the native Indian tribes.

The records of the development of public education during the colonial period are so incomplete that it is difficult to form an accurate estimate of the facilities offered by private agencies. It is evident, however, that after the first and rather extraordinary development of primary education during the early period, the system of elementary instruction was permitted to decline to such a degree that its facilities were extended to but a small fraction of the school population. The university developed with extraordinary rapidity, and remained an important factor in the intellectual life of Mexico during the entire colonial period.

With the Declaration of Independence, new influences began to make themselves felt. The determination of the government to improve the condition of the masses of the people becomes clearly apparent, and this desire expresses itself in a series of attempts to develop a system of primary education. The long period of civil war which followed soon after the Declaration of Independence, and which kept Mexico in a state of agitation and upheaval during the first six decades of the nineteenth century, made it impossible to carry out any of the plans for the development of primary instruction. During this period of anarchy the university also failed to receive adequate support, and when in the early sixties the struggle between Church and State became acute, the university organization was abolished.

Elementary Schools. — The adoption of the Constitution of 1853 marks an epoch in the history of elementary instruction in Mexico. The adoption of this constitution was accompanied by a wave of popular enthusiasm for republican institutions and a revival of interest in popular education.

With the inauguration of President Juarez in 1858 the government undertook the formulation of a systematic plan for the development of primary education. Unfortunately, the provisions of the Constitution of 1853 did not give to the federal government the powers necessary to develop a national system of education. The framers of the instrument in determining the distribution of powers between the federal and the state governments followed, in the main, the provisions of the Constitution of the United States, but in so doing failed to realize that the states forming part of the federal system did not possess either the financial resources or the enlightened public opinion necessary to insure the growth of a vigorous system of public instruction. It was taken for granted that inasmuch as under the political system of the United States primary education had reached a high degree of development under the direction of the individual states, the same results would be secured in Mexico. The period that has elapsed since the adoption of the Constitution of 1853 has served to demonstrate the erroneousness of this view. The limited income of most of the states has made it impossible for them to appropriate for public education even a small percentage of the sum necessary to overcome the alarming illiteracy prevailing throughout the republic.

There is but little doubt that had the federal government been able to secure complete control of public education the system would have made far greater advances during the last half century. This is due primarily to the fact that the revenues and credit of the central government are far in advance of those of the individual states. Furthermore, the fact that the states have failed to develop a distinctive and vigorous political life and that their administrative system is not thoroughly organized makes it difficult for them to secure the expert direction necessary for the growth of a vigorous system of public education. The magnitude of the problem confronting the country can best be seen from an examination of the data relating to illiteracy. Significant as they are, it is likely that they underestimate rather than exaggerate the degree of illiteracy that prevails.

STATISTICS OF ILLITERACY IN MEXICO

	MALE	FEMALE	TOTAL
Persons 12 years or over, who can neither read nor write	3,119,944	3,664,680	6,784,624
Persons less than 12 years of age who can neither read nor write	2,118,843	2,010,299	4,129,142
Persons concerning whom no information could be obtained	76,438	89,564	166,002
Persons who can read and write	1,273,325	906,263	2,179,588
Persons who can read but cannot write	163,568	184,335	347,903

In the central group of states, with 6,239,038 inhabitants, but 1,002,692, or about 15 per cent of the total population, can read and write. In the northern group of states, with a population of 1,174,341, but 287,777 can read and write. In the five Gulf states, with a population of 1,756,006, but 280,087 can read and write; and in the states and territories of the Pacific coast of a total population of 4,437,874, but 609,032 can read and write. These figures are taken from the census of 1900. Unfortunately, no trustworthy statistics as to illiteracy are available, which would enable us to measure the advance that has been made during the last ten years.

Although the federal government exercises no direct control over public education within the states of the union, there exists throughout the republic practical uniformity in organization.

Primary instruction includes five years of elementary grades and two years of advanced grades. The course of study in these schools has been carefully worked out, but the greatest obstacle in the way of efficient service is the failure to pay anything approaching adequate compensation to teachers. Even in the Federal District, where salaries are much higher than in the states, the principals of primary schools receive but \$730 per annum. The compensation of teachers ranges from \$328.50 to \$547.50 per annum, depending upon the degree of preparation and term of service. It is evident that with such low salaries, teaching as a profession does not offer much to allure young men and women, and it is not surprising that the government should find great difficulty in securing competent candidates for the available positions.

The Training of Teachers. — The inadequacy of the facilities for the training of teachers is a matter which has been dwelt upon by every writer on the educational system of Mexico. During the last few years a strong effort has been made in all the states, but especially in the Federal District, to improve this branch of the educational system. The improvement has been due in large part to the influence of the national Department of Public Education, and to the example set by the two excellent normal schools of the Federal District. The new building which has been erected for the men's normal school is thoroughly equipped and modern in every respect. In order to induce young men to enter the teaching profession the government has provided liberally for scholarships and stipends. The Normal School for Women in the Federal District occupies an old building which is not adapted to its purposes. In spite of the inadequate accommodations, however, the school is doing excellent work, and compares favorably with most of the normal schools in the United States.

The course of study in the normal schools covers a period of five years, and includes the following subjects: —

First Year. — Language; Arithmetic; Botany Elements of Zoology; Composition; Drawing; Manual Training; Singing; Physical Training, and (for the men) Military Drill.

Second Year. — Language; Algebra; Geometry; Elements of Physics; Elements of Physiology and Anatomy, Principles of Hygiene; Drawing; Manual Training; Physical Education, Harmony.

Third Year. — Language, Elements of Chemistry; Mineralogy, Elements of Psychology; Geography; Drawing; Manual Training, Harmony; Physical Education, Observation in the School of Practice.

Fourth Year. — Spanish Literature; Logic; Geography; History of Mexico; Pedagogy; Physical Education; Observation and Instruction in the School of Practice.

Fifth Year. — Literature; Ethics; Civics; General History; Civic Instruction; All the Natural and Physical Sciences; Pedagogical Organization; Discipline and Administration; History of Pedagogy; School Hygiene, Physical Education.

Manual, Technical, and Vocational Training.

— In a country like Mexico, in which the native Indian population was for so many years kept in a condition of social subjection bordering on serfdom, without any attempt to develop economic efficiency, the need of the present day is a well-developed system of vocational and industrial training. During the colonial period, and in fact during the greater part of the nineteenth century, little or no attention was given to this phase of education. To-day the statesmen and educators of Mexico realize that national effort must now be concentrated on the problem of making the native Mexican a more efficient worker.

During the last ten years the movement for the introduction of manual training into primary schools, both in the Federal District and in the states, has acquired considerable force. Those who are directing the educational policy of the country fully realize that the fundamental need of the great mass of the Indian population is the kind of training that would turn the attention of the younger men to the mechanical arts. Mexico lacks a native artisan class. The overcrowding of the legal and medical professions has become a serious problem in all the Latin-American countries, and is traceable to the continuance of the old Spanish prejudice against trade and commerce. This tendency has been strengthened by the purely dialectic character of the curriculum of the secondary schools, which are molded after the French system. The introduction of manual training, therefore, into the normal schools of the Federal District with a view to preparing the teachers for this type of instruction possesses a significance in Mexico far greater than in many other countries.

In the matter of vocational training, a beginning has been made in the Federal District, and also in some of the states, notably Chihuahua, but it is true that this movement is still in its infancy. In the Federal District there is an excellent trade school for boys and another for girls.

The school for boys prepares for the following trades: carpentering; woodworking; iron

work; decorative painting and sculpture; electrical and industrial mechanics. For each of these, special courses are prescribed.

The School of Industrial Arts for Girls includes the following courses: typewriting; bookkeeping; stenography; sewing, dress-making; hat making; artificial flower making; embroidery; lace making; wig making; hair dressing; domestic science. In addition a number of courses is taken by all pupils in natural history, physics, and chemistry. In this school over a thousand pupils are registered. It is the purpose of the federal authorities to increase the number of these schools as rapidly as the resources of the government will permit.

Commercial Education. — The introduction of commercial education, especially in its higher grades, is another of the recent changes in the system of public education. The first step in this direction was taken through the introduction of commercial courses in the higher grades of the primary schools of the Federal District. The next step was the establishment of a commercial section in the national secondary school, and the final step in this movement was the establishment of a commercial high school in the national capital. In the states but little has been done in this respect. Through the influence of the former governor of Chihuahua a commercial school was established in the capital of that city.

Secondary Instruction. — The instruction corresponding more or less closely to the high schools of our American system is given in the so-called *Escuelas Preparatorias*, or preparatory schools. The organization, as well as the curriculum of these schools, is patterned after the French *Lycée*, and is designed to prepare students for the professional schools of the university. The system of secondary instruction is well organized in the Federal District, but constitutes the weakest link in the chain of education in most of the states. The most serious criticism to be made is the undue emphasis laid on examinations and the failure to keep in close touch with the work of the pupil during the course of the scholastic year. In every subject a series of printed questions is furnished the pupil, and in most cases his preparation consists in an attempt to memorize the answers to a disconnected series of questions, rather than to secure a broad grasp of any of the subjects.

A serious attempt is now being made to reduce the number of subjects taught, and to require a more thorough training in a few fundamental courses. If this change is made, it will constitute a marked improvement over the present system. The course of study covers a period of five years, and includes the following subjects: —

First Year. — Algebra; mathematics; geometry; Spanish; French; drawing; manual training.

Second Year. — Advanced mathematics; Spanish; French, English, drawing; manual training
Third Year. — Mechanics, physics; Spanish; English, drawing, manual training.

Fourth Year. — Chemistry, mineralogy, botany, geography, English literature; Spanish literature.

Fifth Year. — Zoology, elements of anatomy and physiology, psychology; logic, general history, Mexican history; ethics, Spanish literature.

Higher Education. — The movement for the establishment of a university in Mexico was initiated by Charles V, in 1551, but no courses were offered until 1553. From that time until the final abolition of this institution by the Juarez government in 1867, the only university organization existing in Mexico was under the direct control of the Catholic Church. As the demand for higher education, and especially for professional training, became more insistent, the government established a series of independent professional institutions. The medical school, the law school, and the engineering school grew up independently, each with its own director responsible to the Minister of Public Instruction. This form of organization proved unsatisfactory for many reasons, but especially because it prevented the development of any unity of purpose in higher education and was a permanent obstacle to the growth of that university spirit which exerts so marked an influence on the life and thought of the student body.

The necessity for closer coordination of university instruction became so pressing that the government finally decided to correlate the work of the several independent faculties. The centennial anniversary of Mexican independence was made the occasion for the inauguration of this plan. Under the law of May 26, 1910, the existing schools of law, medicine, engineering, and architecture were made integral parts of the new National University of Mexico. To this a graduate school was added, intended for the conduct of special research in every field of science. The National Preparatory School in the city of Mexico was also made an integral part of the new university organization.

The university is placed under the control of a president, designated as the Rector, and a university council, composed of the president of the university, the deans of the professional schools and the director-general of primary instruction. In addition, four members are designated by the Minister of Public Instruction, and two representatives from each of the professional schools are elected by the respective faculties. The student body is also represented on the university council by a provision which gives to the students in each of the professional schools the right to elect one of their number as their representative on the council. The council is given wide powers over university organization and administration, but the final authority in all important questions is vested in the Minister of Public Instruc-

tion. The official inauguration of the university took place on the 22d of September, 1910. It is, of course, too early to express any opinion on the operation of the new system. The results thus far attained, however, are sufficient to indicate the importance of the step that has been taken. A spirit of solidarity among the students, as well as in the teaching staff, is rapidly developing. The cooperation that has been established between the various faculties is improving not only the content of the courses, but also the spirit of university instruction.

Present Needs of the Educational System. — The experience of the last twenty-five years points clearly to the necessity of increasing the authority of the federal government in all matters relating to public education. With the nationalization of education Mexico will be able to meet two most pressing needs; namely, the extension of the system of manual and vocational training and the introduction of a well-organized system of agricultural instruction. Mexico is at present, and will for a long time continue to be, an agricultural country. Her greatest social as well as economic need is a small land-owning class. Recognizing this fact, the government has devised a plan for the allotment of small holdings, which involves the purchase of great estates and their subdivision into small farms. It is not likely, however, that this plan will be successful until agricultural education has become an integral part of the system of public instruction. This will mean that the curriculum of the rural schools will have to be changed in order to introduce those subjects which will attract the attention of the younger men of the country to agricultural pursuits. The Minister of Public Instruction has devised a plan with this end in view. A modest beginning has been made, but it is likely that the next few years will witness a marked development in this direction.

MIALL, EDWARD (1809-1881). — English politician and Nonconformist minister, born at Portsmouth and educated at St. Saviour's

Grammar School, London. After serving as usher in private schools, he was trained for the independent ministry. Receiving a call to Leicester, he was brought into intimate touch with the working classes. In 1840 he began to interest himself in politics and was strongly opposed to the established church and the Tory government. Adopting the *laissez-faire* principle, he was opposed to compulsion of all kinds, and in 1847 he delivered a lecture at Crosby Hall for the Congregational Board of Education, *On the Non-Interference of the Government with Popular Education*. In this address he strongly upheld the advantages of voluntarism. "The will of man to do good is usually most lusty and vigorous when compelled by circumstances . . . to 'rough it' . . . When all is smooth and mechanical the spirits flag." Authorized education would kill spontaneity and intelligent and disinterested care. In a scheme of state education there was the danger also that a man might be taxed to spread opinions which he did not himself hold. Miall sat in the House of Commons from 1852 to 1857 and from 1869 to 1874. In 1870 his views on compulsory state education had changed, for he supported the Forster bill, and only criticised it because he regarded it as too favorable to the established church. Miall's chief service in English politics was to weld together and secure Parliamentary representation for a party strongly opposed to the established church, whose organ, the *Non-conformist*, he had founded in 1841.

MIAMI UNIVERSITY, OXFORD, OHIO.

— A coeducational institution founded by act of legislature in 1809, although as early as 1789 a proposal had been made for the grant of land for an academy or college. Instruction was begun in a log building, maintained as a "grammar school" until 1818, when a brick structure was erected. The school was raised to collegiate rank in 1824, and the first class was graduated in 1826. The institution made rapid progress under the first president, Robert H. Bishop. Annual state appropriations were not made until 1885. In 1902 the Ohio State Normal College was established in connection with the university, and gives two-year courses for grade teachers, manual training, art, music, domestic science, and rural industrial education. A summer course is also maintained in this department. Admission to the College of Liberal Arts is by certificate from accredited schools or by examination, the entrance requirements being fifteen units. Studies are arranged in a system of groups and free electives, and lead at the end of four years to the A.B. degree. The enrollment in 1911-1912 was 333 students in the college, 173 in the

normal college, and 548 in the summer term. The permanent staff consists of fifty-six members.

MICHELET, JULES (1798-1874). — The French historian was teacher of history at the Collège Sainte-Barbe and at the Ecole Normale, investigator in the Record Office, assistant professor at the Sorbonne under Guizot, and professor of history at the Collège de France (1838). Deprived of his government positions through the political overturn of 1851, he was thenceforth compelled to make his way by his pen. His most famous work is his *Histoire de France*, in eighteen volumes (1833-1867). Among his other works are: *Précis d'Histoire moderne* (1828); *Histoire de la République romaine* (1831); *Introduction à l'Histoire universelle* (1831); *Origines du Droit français* (1837); *L'Oiseau* (1856); *L'Amour* (1859); *La Sorcière* (1862); and *Nos Fils* (1869), this last being his chief educational writing. F. E. F.

MICHIGAN AGRICULTURAL COLLEGE, EAST LANSING, MICH. — A state institution established by legislature in 1855 through the influence of the Michigan State Agricultural Society. This was the first state institution in the United States offering instruction in scientific and practical agriculture. It is under the control of the State Board of Agriculture. The entrance requirements are fifteen units. Five-year courses are offered to those candidates who have not completed a high school course. The following courses are offered: agriculture, engineering, forestry, home economics, leading to B.S., and the veterinary, leading to the D.V.S. Special short courses in agriculture and courses for teachers of agriculture are also given. The enrollment in all departments in 1911-1912 was 1702. The faculty consists of 140 members.

MICHIGAN COLLEGE OF MINES, HOUGHTON, MICH. — Established by act of legislature in 1885 under the government of a board of control appointed by the governor. The institution is located in the heart of the great copper mining region of Lake Superior. Students are admitted by examination or diploma. The degrees of B.S. and Engineer of Mines are conferred on completion of the appropriate requirements. The enrollment in 1911-1912 was 222. The teaching staff consists of thirty members.

MICHIGAN, STATE OF. — A part of the Northwest Territory, organized as a separate territory in 1805, and admitted as the twenty-sixth state in 1837. It is located in the North

Central Division, and has a land area of 57,430 square miles. In size it is about as large as the six New England states, or England and Wales combined. The state consists of two peninsulas, which for administrative purposes are divided into eighty-three counties, and these in turn into townships or school districts. In 1910 Michigan had a population of 2,810,173, and a density of population of 48.9 per square mile.

Educational History — The early history of education in Michigan is largely the history of education in and about Detroit, a number of private and church schools of an elementary nature having been organized there before the organization of Michigan as a territory, the earliest date mentioned being 1755. In 1809 the first school act was passed, but was not even printed, and doubtless was a dead letter from the very first. It directed that populated territory should be laid off into school districts, a school census taken, and a tax levied, the proceeds to be apportioned to the districts in proportion to the amount spent the preceding year for schools. No further attempt to enact a general school law was made until 1827. In 1817, an act was passed creating the "Catholic-epistemiad, or University of Michigan," which provided not only for a single institution of high rank, but the faculty was also empowered "to establish colleges, academies, schools, libraries, museums, botanic gardens, laboratories, and other useful literary and scientific institutions," and to appoint teachers and other school officers in all the counties, towns, and cities of the territory. The central territorial government was to defray the expenses of all education. In 1818 a Lancasterian elementary school was opened in Detroit as a part of the scheme. In 1821 the 1817 law was revised, the University of Michigan established, and a board of trustees created to manage all the schools forming part of it. In 1837 the institution was organized, and in 1841 it opened its doors to men students for the first time. Women were not admitted until 1870.

In 1827 a new school law, which provided for a system of common schools throughout the territory and independent of the university, was enacted. The new law was modeled after the early school law of Massachusetts. Every township containing fifty families was required to support a primary school for six months; townships of one hundred families, a primary school for twelve months; townships of one hundred and fifty families, a primary school for six months and an advanced school for twelve months; and townships of two hundred families must, in addition, employ a grammar school master. The system was a township system, with a proviso, however, that the voters of a township might order the division of the township into districts and elect district boards of three trustees annually. By a two-thirds vote of the electors the law could be

nullified in any township. The schools were to be sustained by the rents from the school lands, and a tax on the property of residents. In 1829 the property of nonresidents was also included. A little later the township tax was abolished, except for indigents and school-houses, and the "rate bill" system was substituted for taxation. A superintendent of common schools was appointed to look after the school lands, and in 1836 this official evolved into a Superintendent of Public Instruction.

The constitution of 1835, adopted in preparation for entrance into the Union, made detailed provision for a state school system, and contained a definite mandate to provide a system of common schools whereby a school should be kept up and supported for three months each year in each school district of the state. The school laws of 1837, enacted in response to the mandate of the constitution, provided for a system of schools to be maintained in part by state appropriations, in part by local taxes, and in part by the rate bill. The law of 1837 drawn up by John D. Pierce, called the father of the Michigan school system, forms the foundation of the present system. Some progress was made in the better settled communities, but very little elsewhere. Detroit organized a graded school system under a board of education, in 1842, and provided free schools for its children, and in 1846 union district graded schools were permitted in the state for the first time. By 1850 seven such graded schools had been formed; by 1860, eighty-five; and after 1860 the progress was rapid, there being 248 by 1870, 389 by 1880, 513 by 1890, and 711 by 1900. A state institution for the deaf, dumb, and blind was established in 1848, and a separate institution for the blind was established in 1880. The state normal school at Ypsilanti was established in 1849, and an *ex officio* State Board of Education was created to manage the school.

In 1850 a new constitution was adopted which made much more detailed provision for a system of public education. An elected, instead of an appointed, Superintendent of Public Instruction was provided for; the school land fund was safeguarded; the legislature was ordered, within five years, to provide free primary schools, although it did not do so for nineteen years; a three months' school was ordered in every district; the method of election and functions of the board of regents for the university were specified; an elected instead of an *ex officio* State Board of Education, to manage the state normal school, was provided for; and township libraries were ordered to be established.

The first teachers' institute was held in 1846; in 1855 they were first authorized by law, and in 1877 county institute funds were created by requiring teachers to pay fees for examinations and certificates. In 1855 the State Agricultural College was established. Until 1861

this was under the control of the State Board of Education, but in that year it was transferred to the State Board of Agriculture. In 1855 an industrial school for boys was established, and in 1879 one was also established for girls. In 1871 a state institution for dependent children was established, and in 1880 a separate institution was established for the blind. In 1859 districts were permitted to organize high school departments, and in 1871 the University of Michigan began the accrediting system (*q.v.*) for entrance to the university. In 1869 the "rate bill" was abolished, and the schools finally were made free.

In 1867 a law was enacted creating county superintendents for each county, and establishing a form of the county system of school administration. The certification of teachers, which since 1837 had been in the hands of the township school inspectors, was now given to the county superintendent. In 1875 this law was repealed, township superintendents were created, and the certification was given to them. As this did not prove satisfactory, a board of three examiners for each county was created in 1881, and certification was given to them. In 1887 the law was revised so as to reduce the number of examiners from three to two, and the two were required to elect a secretary, who examined all teachers and acted as the executive officer of the board. In 1891 the secretary was changed into a county commissioner of schools, to be elected by the people. In 1879 the State Board of Education was directed to prepare questions for county teachers' examinations, and in 1887 their use by county examiners was required. From 1867 to 1875 the State Superintendent was empowered to grant state teachers' certificates, but in 1879 this power was given to the State Board of Education.

In 1871 the first "act to compel children to attend school," was passed, and in 1885 the first "act regulating the employment of children" was enacted. In 1885 the city of Saginaw was permitted to provide free textbooks, and in 1889 a general free textbook law was enacted for the state. In 1891 school boards were authorized to establish kindergartens, and the power to issue certificates to certain of its graduates was granted to the University of Michigan. In 1895 the Mt. Pleasant normal school, established privately in 1891, was accepted by the state. In 1899 a third state normal school was established in the northern peninsula at Marquette, and in 1903 a fourth state normal school was authorized to be established in the western part of the state. The same year normal training classes were also authorized for any county not having a state normal school.

In 1908 a new state constitution was adopted. The State Superintendent was made *ex officio* a member of the State Board of Education, and of all other boards having control of public

instruction in any state institution; the State Board of Agriculture was made a constitutional body, and its duties defined; the election of the Superintendent, the State Board of Education, and the State Board of Agriculture was changed from the November to the April elections; the maintenance of the university, the college of mines, the agricultural college, and the state normal schools was made mandatory; boards of township inspectors were abolished; and the minimum school term was raised from three to five months. Otherwise there were only verbal changes from the constitution of 1850. The legislature of 1909 established an educational and professional standard for the offices of State Superintendent and county commissioners; required districts to pay high school tuition for their pupils, and also authorized transfers; required instruction as to communicable diseases; and provided for state aid to agricultural high schools. The legislature of 1911 empowered districts to establish trade, vocational, industrial, marine, and manual training schools.

Present School System.—At the head of the school system of Michigan is a State Superintendent of Public Instruction, elected by the people at the April elections for two-year terms. He is paid \$4000 per year; must be a graduate of a university, college, or normal school, and have taught five years in Michigan. He is a member, *ex officio*, of all boards of an educational nature in the state, but without a vote. He has general supervision of public instruction in all of the public schools of the state and in all public institutions which are educational in character; may require cities and districts to provide proper educational facilities, and may bring suit to enforce the law; may inspect the books of any school unit; must prepare rules for the management of township and district libraries; must apportion the school money to the townships and cities; must authorize the establishment of new county training schools; may request the governor to remove any county commissioner, or examiner; and must prepare an annual report to the governor and legislature.

The State Board of Education consists of four citizens, two elected at each biennial spring election, and the State Superintendent of Public Instruction, *ex officio*. The board is a body politic and corporate; has control of the courses of instruction and the management of the four state normal schools; grants certificates to teach to graduates of these schools; examines candidates for life diplomas; may approve teachers' certificates and life diplomas from other states; may approve the pedagogical course in colleges and universities, other than the University of Michigan, for the teacher's certificate; adopts a textbook in physiology and hygiene for use in the schools; and makes an annual report to the governor. The board must meet at least twice each year, and the

members are paid \$3 per day and expenses for their services.

For each county the voters elect a county school commissioner, at the April elections, for a four-year term. The board of county supervisors fixes the compensation of the commissioner and his deputies, if he has any. On the recommendation of the State Superintendent he may be removed from office by the governor. To be eligible, each county commissioner must have had twelve months' experience as a teacher in the schools of Michigan, and must be a graduate either of a college or of a normal school, or hold a first-grade teacher's certificate. In counties having fifty or less teachers a second-grade teacher's certificate will answer. It is his duty to keep a record of all examinations held, sign all teachers' certificates, keep all records; collect the institute fees, furnish the township clerks with a list of authorized teachers; visit each school at least once each year, and make an annual report to the State Superintendent and act subject to his instructions. His powers and duties are rather limited, and his salary very small. The county supervisors appoint two county examiners, for two-year terms, and these, together with the county school commissioner, constitute the county board of examiners. The examiners must hold valid teachers' certificates. They give two examinations each year, and an extra examination in October, using questions prepared by the State Superintendent of Public Instruction.

Below the county school authorities are the township officials, and the townships may be still further divided into districts. In the northern peninsula the township organization has supplanted the district organization, and in the southern peninsula, the beginnings have been made. Where the township organization has been instituted, a township board of five trustees, elected at large, controls the schools of the township, outside of cities and graded school districts. This board reports to the township clerk and treasurer, and to the county commissioner. Elsewhere, where the district form of organization prevails, annual school meetings are held in July in each district, and each school is under the management of a board of three district school officers, elected for three-year terms, consisting of a moderator, director, and treasurer. This board is a body corporate and politic, may build schoolhouses, estimate and vote money for maintenance, hire teachers, purchase books for indigents, make rules and regulations, admit and suspend pupils, and must take an annual school census and make an annual report to the district meeting in writing, and to the township clerk. The director usually has charge of the schoolhouses and grounds, makes purchases and repairs, acts as clerk of the district, and compiles the annual reports. The treasurer keeps all accounts, pays all bills, and reports to the

township treasurer. The township clerk reports to the county school commissioner.

An annual meeting of school officers of each county is held by the county school commissioner, and one member from each district or township board is expected to attend. He is allowed \$2 per day and expenses for so doing. Graded school districts may be formed in any district, or by two or more contiguous districts, by a majority vote at any annual school meeting. For such, a board of education of five is elected at large, and, if the district employs six teachers, it may also employ a superintendent. Such a district may also establish a high school. On petition of one third of the taxpayers of any township not having in it an incorporated city or village, the township board shall submit to a vote the question of forming a rural high school. If adopted by a majority, a board of three trustees is elected to manage the school and to raise taxes for it. The course of instruction is fixed by the State Superintendent. Very few such schools have so far been formed. Boards of trustees in districts not maintaining a high school may pay tuition and transportation of pupils in neighboring high schools. Any township, city, or district may maintain a school library, and any township may divide its library among the school districts. A librarian may be appointed, and any township may levy an annual township library tax. All county fines for breaches of the penal laws go to the county library fund, and the state also makes an annual grant. Such funds are apportioned to the different townships, cities, and districts maintaining libraries, on the basis of the number of school census children in each. A State Board of Library Commissioners, appointed by the governor, and consisting of four citizens and the state librarian, *ex officio*, advises with libraries as to their work, and all free libraries report to them through the county school commissioners. This board is allowed \$4800 per year for its work. Nearly all townships and districts report libraries, the township libraries averaging about 1000 volumes, and the district libraries about 600 volumes. Each township, city, or district selects its own textbooks and contracts directly with the publishers, and any district may vote at an annual meeting to provide free textbooks. About one sixth of the districts provide free textbooks. Any district may establish a day school for the oral instruction of deaf children, and the state will grant aid up to \$150 per year per pupil.

School Support.—The state originally received 1,067,397 acres of land from Congress from the sixteenth-section grants made to the states for education, two townships of land (46,080 acres) for a seminary of higher learning, and 240,000 acres for a college of agriculture and mechanical arts. In 1850 Congress also gave to Michigan 5,838,775 acres of swamp land for schools. The two funds now amount to about

five and a quarter million of dollars. The state pays interest on the sixteenth-section fund at 7 per cent, and upon the swamp-land fund at 5 per cent, and the income is distributed to the schools on the basis of school census, being worth about forty-seven cents a child at present. The two college funds now amount to about a million and a half, and the income is about \$100,000 a year. There is also a normal school fund of \$68,822, which produced \$4168 for the normal school in 1910.

To the income from the sixteenth-section funds is added the surplus from specific state taxes (corporation taxes), which vary somewhat from year to year, but amount to about three quarters of a million dollars annually. The addition of the surplus taxes has caused the state apportionment to increase from forty cents to fifty cents per pupil, between which it varied up to 1880, to \$1.33 by 1890, \$2.15 by 1900, \$3.50 by 1905, and to about \$6 at present. The total sum is apportioned by the State Superintendent to the counties, and by the counties to the townships and districts, on the basis of school census. This pays a little more than one half of the cost of the school system. A township one-mill tax is levied, which is apportioned to the districts on the basis of the amount each pays. The remainder (about 40 per cent) comes from additional local taxation. The undesirability of the school census as a basis for the apportionment of school funds (see APPORTIONMENT OF SCHOOL FUNDS) is nowhere better illustrated than in Michigan, where some districts have a struggle for existence, while others possess accumulations sufficient to run the schools for many years. At the date of the last report, 861 school districts had enough teachers' wage money on hand at the end of the year to run the schools for at least two years, while some had enough to run the schools from ten to twenty-two years.

The total amount expended for the maintenance of schools for the last year for which reports are available was \$13,223,773, or a per capita of the total population expenditure of \$4.70. The average term provided is about eight and one half months. The percentage of attendance based on enrollment averages about 70 for the state, while in the city districts it averages a little over 95.

Educational Conditions.—The southern part of the state has a number of important manufacturing cities, but the northern part is sparsely settled. About 30 per cent of the total population live in these southern cities, about 10 per cent in small towns, and 60 per cent under rural conditions. The larger southern cities (Detroit, Grand Rapids) are very cosmopolitan, but the rural sections are largely of American and Canadian stock. The average for the state is about 75 per cent native. Only about $\frac{1}{4}$ of 1 per cent of the total population is of the negro race, and separate schools on account

of race or color are prohibited by law. The percentage of illiteracy is comparatively low, being but 4.2 per cent and confined almost entirely to the foreign population in the cities.

The state has a good compulsory education law, with fairly effective means for its enforcement, all children seven to sixteen years of age being required to go to school the whole time the public schools are in session, unless excused for certain specific reasons. The employment of children under fourteen during school time is prohibited, but children from fourteen to sixteen may be allowed to work if they have completed the eighth grade, and if they have a work certificate from the school authorities. The sheriff of each county must appoint a county truant officer, who is allowed \$3 a day and expenses. Teachers must verify census lists, and report absences to the county commissioner. Deaf pupils must also go to the day schools for the deaf, or to the state school for the deaf. Blind children, with certain exceptions, must also go to school. Any school board may establish an ungraded school for truant. Disorderly or incorrigible boys under sixteen, and girls under seventeen, may be sent to the state industrial schools.

The state has good schoolhouses, the 8453 schoolhouses in the state averaging about \$4000 each in value. Many towns and cities, as well as many country districts, have schools of high grade. On the other hand, many village and town schools are inadequately financed, and are of low grade. This inevitably happens in a state using the census basis of apportionment as the sole basis. Agricultural instruction has been made a marked feature during recent years, and manual training and domestic science have been introduced in many places. The consolidation of schools has made some headway in the better settled portions of the state, and the township unit, which leads to similar results, is being urged for adoption generally in the southern peninsula, as it has been in the northern.

Teachers and Training.—The state employed approximately 15,000 teachers in 1910, about one half of whom were employed in ungraded rural schools. About 17 per cent of the total number were men. Five grades of certificates are granted on examination. The first and second grades require previous teaching experience of nine and seven months, and are valid for four and three years respectively. The third grade "A," for primary work only, requires three years' previous experience, and is valid for three years. The third grade "B" and "C" are valid for one year only, "C" being limited to a particular district. Graduates of the state university and of the Southern Agricultural College receive certificates, on certain conditions, and the State Board of Education may accredit other colleges. Normal school graduates are also certificated on graduation, and normal school diplomas from other

states may also be endorsed by the State Board of Education. Cities employing a superintendent may certificate their own teachers, if they so desire.

The state maintains four state normal schools for the training of teachers, located at Ypsilanti (1852), Mt. Pleasant (1895), Marquette (1899), and Kalamazoo (1903). These maintain regular normal school courses, and each must also maintain one course preparatory for rural school work. A marked feature of the Michigan system for the training of teachers is the county training school. Since 1903, in any county not containing a state normal school, any district and the board of supervisors of the county may vote to unite in establishing a county training school (see **TEACHERS, TRAINING OF**) for the better preparation of teachers for the rural schools. The establishment of any school must be authorized by the State Superintendent of Public Instruction, and he, together with the county commissioner of the county and the superintendent of the schools of the district, constitutes the county training school board. They regulate admissions, establish a one year's course of study, and grant diplomas of graduation. Graduates may teach, for three years, in any school in the county not having over two teachers, and the board may renew the certificate on evidence of success. The state grants aid of \$500 for each training school teacher employed, up to two teachers, and the county grants aid up to one half of what the state gives. Before 1903 less than 2 per cent of the rural teachers of Michigan had had any professional training, while now over 30 per cent have had at least one year of professional preparation. About fifty such schools were in operation by 1910. Teachers' institutes are held in each county each year, and all male teachers are assessed \$1 and female teachers fifty cents each year to provide an institute fund.

Secondary Education.—The high school system of the state is well organized, there being about 400 public and private high schools in the state, nearly all of which maintain a four-year course and close relations with the University of Michigan (see **ACCREDITED SCHOOLS**). In 1907 county schools of agriculture were authorized. Any county, or two or more adjacent counties, may vote to maintain such a school, which is placed under the management of a county board of education, consisting of the county school commissioner and four citizens appointed by the county supervisors. The schools must teach agriculture, domestic science, and manual training. The course of instruction is determined by the State Superintendent and the president of the agricultural college. Such schools must have ten acres of land. If the school has cost \$20,000 and has 100 acres of land, the state will grant aid up to two thirds the cost of maintenance, but not over \$4000.

Higher and Special Education. — The state maintains the University of Michigan (*q.v.*) at Ann Arbor, opened in 1841, which is one of the largest and best of the American state universities, and one which has long rendered important service. The state also maintains the Michigan Agricultural College (*q.v.*) at East Lansing, opened in 1857; and the Michigan College of Mines (*q.v.*) at Houghton, opened in 1886. These stand as the culmination of the system of public instruction provided by the state. In addition to these, the following institutions within the state offer collegiate instruction: —

INSTITUTION	LOCATION	OPENED	CONTROL	FOR
Albion College	Albion	1843	M E	Both sexes
Hillsdale College	Hillsdale	1855	Nonsect.	Both sexes
Kalamazoo College	Kalamazoo	1855 (?)	Bapt.	Both sexes
Adrian College	Adrian	1859	Meth Prot.	Both sexes
Olivet College	Olivet	1859	Cong	Both sexes
Hope College	Holland	1866	Refd	Both sexes
Detroit College	Detroit	1877	R C	Men
Alma College	Alma	1887	Presby.	Both sexes

The state also maintains the Michigan School for the Blind, at Lansing; the Michigan Employment Institution for the Blind at West Saginaw; the Michigan School for the Deaf, at Flint; the Michigan State Public School for poor and dependent children, at Coldwater; the Michigan Home for Feeble-Minded and Epileptic Children, at Lapeer; the State Industrial Home for Girls (reformatory), at Adrian; and the Michigan Industrial School for Boys (reformatory), at Lansing. MICHIGAN, UNIVERSITY OF, ANN ARBOR, MICH — The first of the state universities to take and hold a position of prominence and leadership among American universities. It was the first institution to utilize with some degree of wisdom the Congressional land grants, made from 1787 onwards, for the promotion of higher learning in the newly created states. The Constitution of 1835 under which Michigan came into

the Union made it obligatory upon the legislature to create from the sale of these lands a permanent endowment for a university and to provide a secure investment for the funds. The first legislature, acting under the advice of the State Superintendent of Public Instruction, John D. Pierce (*q.v.*), passed the enabling act of 1837 under which the Regents, eighteen in all, were to be named and the various departments provided for. Following the Prussian idea, the new institution was distinctly thought of as an integral and crowning part of a state system of public instruction, and it has come more and more to realize this ideal. Three departments were specified: (1) The Department of Literature, Science, and the Arts; (2) The Department of Law; (3) The Department of Medicine. There were also a number of so-called "branches" in different towns, which were fostered by the Regents as tributary to the University; but for lack of funds these had to be left to their own fate after a few years, and in their place sprang up the union or high schools which continued to supply the need. The University was opened for students in 1841, and the first class consisting of eleven members was graduated in 1845. Defects in organization soon became apparent; and the constitution of 1850 reconstituted the governing board, reducing the number to eight, and adding very materially to its powers. The Regents now became a constitutional body and were given absolute control of all moneys received from the interest fund and from fees, without any interference or direction from the state capitol. This feature of the fundamental law, which all subsequent revisions have left unchanged, was at that time unique and is generally believed to have been an important factor in the subsequent prosperity of the institution.

The new constitution directed the Regents to appoint a President who should preside at their meetings (but without a vote) and who should be the principal executive officer of the University. The choice fell upon Henry Philip Tappan, of New York, a graduate of Union College and of Auburn Theological Seminary, a man of wide experience as an educator, and a writer of repute on educational and philosophical subjects. This appointment may be considered the most important single event in the history of the University. During the eleven years of the Tappan administration (1852-1863) the institution was transformed. A nonclassical course was offered, and the degree of Bachelor of Science was first conferred in 1855; courses in engineering were established; the chemical laboratory was built; the astronomical observatory was opened, with Dr. Francis Brünnow as director; graduate study was projected and a beginning made; a department of law was organized (1859). The attendance was quadrupled and became national in character. Names now

UNIVERSITY OF MICHIGAN.

appeared on the faculty rolls which were to shed lasting fame on the University — amongst others, Henry S. Frieze, Corydon L. Ford, Thomas M. Cooley, and Andrew D. White. President Haven (1863-1869) carried forward the policies of his predecessor. During this period the courses in engineering were developed under the direction of Professor De Volson Wood (*q.v.*), and the work in English and rhetoric received a marked impulse under Professor Moses Coit Tyler (*q.v.*). Then also Edward Olney began his memorable career at the University as a teacher of pure mathematics. From 1869 to 1871 Professor Henry S. Frieze (*q.v.*) was acting president. These years are noteworthy for two changes which have exerted an important influence upon the educational history of this country: women were admitted to all departments on an equal footing with men (1870); and the so-called diploma or certificate system of admission from approved high schools was instituted.

In 1871 began the long administration of James Burrill Angell, extending over thirty-eight years. During this period the College of Dental Surgery was added, and the same year (1875) the Homœopathic Medical College. In 1876 the School of Pharmacy was organized as a separate department, and the Department of Engineering in 1895. In 1878 the elective system was greatly extended, and a closer relation was established between the University and the public high schools of the country. From this time the institution developed rapidly in many directions. The attendance multiplied, the income steadily increased, the faculties were enlarged; and long before his retirement the institution had taken on an international character. All this had been made possible by the attitude taken toward the University by the state legislature shortly before President Angell's advent. Hitherto the income of the University had been restricted to the interest on the land-grant fund (then yielding something less than forty thousand dollars) supplemented by student fees. The legislature now laid an annual tax of one twentieth of a mill on the taxable property of the State for the aid of the University. This rate has been increased from time to time till the annual income from this source is now something over eight hundred thousand dollars. The annual budget at present (1912) shows an expenditure of about a million and a quarter dollars. The attendance has reached a total of 5582, distributed in every state and territory of the Union and in thirty-three foreign countries.

On President Angell's retirement in 1909, he was succeeded by Harry Burns Hutchins, who had been Dean of the Department of Law since 1895. President Hutchins has been especially active in organizing more closely the alumni of the State, in establishing res-

idence halls for the women students, in securing fellowships for the encouragement of graduate studies and in advancing the standards of the professional schools.

MICROCEPHALOUS. — Having a small head. Individuals having a head with a circumference less than 42.5 centimeters (17 inches) are counted in this group. With this condition there is associated micrencephalus, or diminished size of brain. Brain weights in microcephalics have been found to be from 200 to 800 grams (normal weight being from 1300 to 1500 grams). All individuals with micrencephalus have only the rudiments of intelligence.

MIDDENDORF, WILHELM (1793-1853). — German educator, friend and coworker of Froebel (*q.v.*), born in Brechten, Westphalia, and educated at the gymnasium at Dortmund and the University of Berlin, where he studied philosophy under Fichte and theology under Schleiermacher. In 1813 he joined the volunteer corps of Lützow and took part in the War of Liberation. In 1817 he was called by Froebel to Keilhau (*q.v.*), where he remained until his death. He carried on the work of Froebel and did much for the general introduction of the kindergarten.

MIDDLE AGES, EDUCATION DURING THE. — The educational activities, interests, and institutions of the Middle Ages are treated under a variety of headings. The foundation elements of this period are considered in the articles on CHRISTIAN EDUCATION IN THE EARLY CHURCH, THEOLOGICAL EDUCATION, and the various articles on the individual Church Fathers. The articles on NEO-PLATONISM, MYSTICISM, and STOICISM treat of the philosophical elements entering as historic factors; the section under ROMAN EDUCATION on the late historic period is also of significance. The actual educational activities of the period, especially as they center around institutions, are presented in the articles on CHURCH SCHOOLS; ABBEY SCHOOLS; CLOISTER SCHOOLS; CONVENT SCHOOLS, and the articles on the various Monastic Orders and education.

See also the article on TEACHING ORDERS OF THE ROMAN CATHOLIC CHURCH. Supplementing these are the articles on COLLEGE; COLLEGIATE CHURCH SCHOOLS; GRAMMAR SCHOOLS; BISHOPS' SCHOOLS; CHANTRY SCHOOLS; HOSPITAL SCHOOLS; GILDS AND

EDUCATION. See also the articles on **LATIN**, **GREEK**, **LOGIC**, etc. For the legal side see especially **CANON LAW**, **EDUCATIONAL PROVISIONS IN**. The most significant phase of education during the late Middle Ages is discussed under the origin and early work of the **UNIVERSITIES**. As preliminary to the movement, the article on **SCHOLASTICISM AND THE SCHOOLMEN** is also of vital importance. The curriculum is dealt with in the article on **LIBERAL ARTS**; see also the medieval section of the various articles on the subjects of study. Connected with this subject also are the articles on **MYSTICISM**, **NEO-PLATONISM**, and **REALISM**. These topics all deal with education as it is connected with the Christian Church.

There are two other additional phases of education during the Middle Ages of great if not of similar importance. One relates to secular education; that is, of nobles and the ruling classes. This phase of education is presented primarily under the captions **CHIVALRIC EDUCATION AND GENTRY AND NOBLES**, **EDUCATION OF**. Related to these are numerous articles on the writers of works relating to this education, as Castiglioni, Peacham, etc. See also the articles on **MANNERS AND MORALS**, **EDUCATION IN**, and on **SOCIAL REALISM**. The third phase of education is that relating to the common people. Here there is little organized effort and few institutions. But the fundamental aspect of the education of the great masses is discussed under **APPRENTICESHIP AND EDUCATION**. Related to this are the discussions of the **POOR LAW AND EDUCATION**, and **GILDS AND EDUCATION**. The following discussion will relate only to the general conditions of the Middle Ages. In this connection read also the articles on the **RENAISSANCE**, **EDUCATION DURING THE**, and **REFORMATION AND EDUCATION**, for tendencies at the close of the Middle Ages.

General Characteristics. — Both the matter and the manner of education in the Middle Ages have been commonly conceived as something *sui generis*, a product, and a not very important product, of the Middle Ages themselves. Medieval education has been represented as different alike in source, subject, and scope from the education of ancient times which preceded it and that of modern times which followed it. Medieval education has been supposed to be separated from that of ancient times by the deluges of the coming of Christianity and the barbarian invasions, and from that of modern times by the hiatus of humanism and the Reformation. In fact, education in the Middle Ages was carried on without a break from the heathen and ancient world and continued without a break into the humanistic and modern world. The educational institutions of the Middle Ages were the direct offspring of the educational institutions of Greece and Rome and the direct parents

of those of England, Germany, and America. The very stuff of which education was woven, a study of the language and literature of Rome, and at intervals of those of Greece, was practically identical from the days of Cicero, we may almost say of Demosthenes, to the days of Gregory the Great, and from the days of Gregory the Great to those of Thomas à Becket, of Luther and Cranmer, and since then to the days of the younger Pitt and Washington, of Bismarck and Gladstone. Or, looking not at the educated, but the educators, we find a continuous line from Chrysippus to Quintilian, from Quintilian to St. Augustine, from St. Augustine to William Waynflete and Thomas Wolsey, from them to Thomas Arnold (*qq v.*). There has been indeed a greater change in the subjects of education since 1850 than there was during the whole period from 450 B.C. to A.D. 1850. But there is one important difference between the education given in the years from A.D. 450 to A.D. 1450 which marks that millennium off as a separate epoch in the history of education and distinguishes it emphatically from the periods which precede and follow it, and may almost be taken as defining the era of the Middle Ages itself. This difference lies not in the institutions, in the subject, nor in the method of education, but in its object. Till the middle of the fifth century the object of education was to fit a man to be a good citizen and a successful man of the world. From the middle of the fifteenth century the same object began to be put forward, and from the middle of the sixteenth century became the accepted object of education. But in the thousand years between education had a different object. The main object of education was no longer to prepare a man for this world, but for the next; no longer to make him a good citizen or to be successful in this life, but to be a good Christian and to attain successfully the world to come. For patriotism, was substituted religion; for the promotion of society, the saving of a man's own soul. The whole of education was dominated by the Day of Judgment and the dread of the world to come, and the necessity of the appeasement of the Judge by self-abasement and self-torture, by constant prayer and assiduous asceticism. The Stoic philosopher and the Essene met together and, reincarnated as monk, conquered the world. (See **MONASTIC EDUCATION** for related articles.)

Fusion of Christian and Roman Education. — It was not merely the coming of Christianity which produced this change. The early Christians (see **CHRISTIAN EDUCATION IN THE EARLY CHURCH**) took the schools as they found them. They used the public grammar schools and rhetoric schools as they had come down from the unendowed schools of Athens and Alexandria. Quintilian, c. 91, marked a transition from the old to the new style, from the voluntary fee-paying school to the endowed

free school. At the beginning of the third century after Christ, Alexander Severus had made endowed schools general; the Christian Emperor Constantine, in 321, extended the privileges of the masters and set an example for the mediæval clerks by exempting them from military and municipal service; and the anti-Christian Emperor Julian, in 362, also anticipating the royal prerogative in the matter of clerical appointments, made the appointment of masters by municipalities subject to imperial confirmation. (See GRAMMAR SCHOOL.) The Christian Gratian in 376 settled a universal and high scale of salaries for the various masters of Latin and Greek grammar and of rhetoric. It is noticeable that even then Greek was becoming a rarity in the schools of the West as the appointment of a Greek master at the then capital Trier or Treves was conditional "if a fit one can be gotten." It may be remembered that St. Augustine, who was born in 354 and was therefore at school in the decade before Gratian's edict, was taught Greek, but hated it and never mastered it. He himself kept a rhetoric school first at Carthage and then at Milan, when he became a Christian and then a bishop. Sidonius Apollinaris, born in 431, was educated at Lyons Grammar School with Avitus, who rose to be for a short time Emperor, and himself, after being Prefect of Rome, became a bishop and a saint. In 483 he wrote a poetical epistle to the rhetoric schoolmaster at Perigueux, and a letter to his son, when following him at the grammar school at Lyons, warns him much as a modern father might against loose talk, and encourages him to take an interest in his Vergil and Homer.

In Italy the schools continued in spite of the barbarian conquests, for the Goths were Christians. Theodorici's own grandson was sent to a grammar school and flogged in the usual way till the nobles (c. 525) protested against his spirit being broken and demanded that he should be trained in the use of arms instead. Gregory the Great (q.v.) is said to have learned grammar, rhetoric, and logic in the schools of Rome. But his works contain small traces of classical culture, and he was perhaps the last man of eminence to be brought up in the old way. In Gaul the public schools of grammar and rhetoric had meanwhile disappeared, though it is impossible to fix the exact moment of their disappearance, and so far as schools existed at all they were maintained by the bishops. They had fallen like the municipalities which controlled them, under ecclesiastical control.

Monasticism and Learning and the Early Middle Ages — It is clear that the monastic spirit was gradually invading the Western church as it had already done the Eastern, and tending to displace the study of classical literature. The fifth century witnessed the rise of a school of Christian poets, who en-

deavored to substitute the Jewish and Christian mythology in literature for the pagan. The first attempt in this line seems to have been made by a lady, Proba Valeria Fullonia, wife of a proconsul in Gaul at the end of the fourth century with *Centones Vergiliani*, which consisted of lines of Vergil wrested from their context and rearranged so as to make a patchwork life of Christ. Earlier, Sedulius, about 450, master or past master of a rhetoric school in Italy, wrote a work in better taste, called *Carmen Paschale*, probably in parody of Horace's *Carmen Seculare*, in which the life and death of Christ is made the subject of a long poem in Latin hexameters on the Vergilian model. He was followed by a whole school of authors, chief among whom was Aurelius Clement Prudentius (q.v.), a rhetoric master and lawyer at Rome, who has been called the Christian Pindar. In a wonderful variety of meters, his daily hymns, *Liber Cathemerlon*, and his *Psychomachia*, or *Battle of the Soul* between virtues and vices, were published in 409. We have evidence that they were a favorite schoolbook in the fifth, the tenth, and the fifteenth centuries. Juvenius (q.v.), another rhetoric schoolmaster in his *Historia Evangelica*, turned the Gospels into Vergilian hexameters, and Dracontius, pupil of the grammar schoolmaster Felicianus "who restored letters to Carthage," wrote hexameters, *De Laudibus Dei*, between 484 and 496. All these poets write with a more or less conscious desire to supersede their classical but pagan models as schoolbooks, and Pope Gelasius, in 496, specially commended Sedulius for this purpose. Perhaps it was the use of the original Vergil instead of these new poets which drew down on the devoted head of Bishop Desiderius of Vienne in 597 the fierce rebuke of Gregory the Great. "We cannot relate without shame that it has come to our household that your brotherhood teaches grammar . . . since the praise of Christ cannot lie in one mouth with the praise of Jupiter. Consider yourself what a crime it is for bishops to recite what would be improper in a religiously minded layman." We cannot doubt that what Gregory had in his mind was the line in Vergil's *Eclogues*, always a favorite schoolbook, *Ab Jove principium, Muse, Jovis omnia plena*, and the loves of Corydon and Alexis. We must remember that Gregory was the first monk to become Pope, and it shows how even in a nobleman of Rome, ex-prefect and imperial official though he was, the monastic spirit was tending to destroy culture and the classics. We do not know whether Didier answered this missive, but he had an answer ready to his hand in Augustine "On Christian Teaching" (ii. 39-42), who laid down that all branches of heathen learning, while containing much superstition, "contain also liberal instruction adapted to the use of the truth" and cites Lactantius, Cyprian, and other

Fathers who were "laden with the spirit of the heathen," while Moses himself was "learned in all the wisdom of the Egyptians." The reasoned defense of learning not only of grammar, but rhetoric and even logic, contained in this work of Augustine, written in 427, was one of the main influences which prevented the monastic furore, which attacked schools as it attacked marriage and other institutions, from converting the Dark Ages into absolute blackness. But it was into the hands of bishops and not of monks that the rule and government of cities and of schools had fallen. But Gregory of Tours (*q.v.*) shows that not all the bishops themselves had the learning of Didier of Vienne. He had learned to read at the age of eight, but he was taught by reading not the classics, but the Scriptures, and never learned grammar properly, though his teacher was Avitus, Bishop of Clermont. In later days at Tours, with the advent of Venantius Fortunatus perhaps, who had "sipped the ills of grammar and drunk the deep pools of rhetoric in Italy," he read, whether in an anthology or otherwise, Vergil, his quotations from which, dragged in and unassimilated, "lie like lumps of marl upon a barren moor." The growing asceticism shows itself in the necessity under which Venantius, a litterateur born if ever there was one, found it necessary to write a labored *Life of St. Martin* in hexameters, and Gregory of Tours, a born historian, had to supplement his invaluable *History of the Franks* by the *Glory of Confessors* of the faith. M. Paul Roger has set himself to show that all the reputed educated men of the succeeding generations, 590 to 650, had received no more instruction than that of learning Latin in and by and for the sole purpose of understanding the Scriptures, and certain it is that the lives of the saints, which afford our sole knowledge of these schools, speak almost invariably of their being instructed in sacred letters (*sacris litteris*) or divine learning (*divinis disciplinis*). General education and, by consequence, general learning had died out in Gaul. In Spain, on the other hand, where the controversy between Arians and Catholics still prevailed, learning was kept alive. King Sigebert, to whom Isidore of Seville had dedicated his *De natura rerum*, which remained one of the great works of the Middle Ages, was himself partly learned, *scientia litterarum ex parte imbutus*. Isidore, brother of the Archbishop of Seville, was the most learned man of the age. He forbids, indeed, monks to cultivate learning. "A monk should eschew reading gentile works or the writings of heretics; for it is better to remain in ignorance of their pernicious teachings than by trying thus to run the risk of flying into the snare of error." But he does not apply his prohibition to the clergy who lived in the world and had to preach. "Ignorance is the mother of error and the nurse of vice." "Better grammar than heresy." His

Etymologies, the great encyclopedia of the Middle Ages in twenty books, is full of quotations from classical authors, and though there is some reason to think that it was intended to supersede the dangerous necessity of referring to the originals, it did, in fact, materially tend to prevent their being altogether barred. In science it proved to be a last flicker of the torch. It was, however, to England that the credit is due of preserving learning from complete extinction by a system of education. If Bede (*q.v.*), who, it is true, wrote a century after the event, is to be trusted, in 631 there were still grammar schools in Gaul and in Kent, which served as a model for the rest of England. Sigebert, king of the East Angles, was converted to Christianity when an exile in Gaul. Wishing to imitate what he had seen well done there, he set up a school in which boys should be taught letters (*litteris eruditur*), and when this word is used without qualification it must be taken to mean, unless the context otherwise requires, grammar; that is, learning Latin by reading Latin authors, and probably classical authors. Sigebert did not, however, find it necessary to import his schoolmasters direct from Gaul, but with the assistance of Felix, a Burgundian, then living in Kent, whom he made bishop of his kingdom, he gave them masters and ushers after the fashion of Canterbury (or Kentish) custom. As the date is only thirty years after Augustine's settlement at Canterbury, it is to be inferred that both at Canterbury and later at Rochester, when a bishopric was created there, the first archbishop had instituted grammar schools. A generation later by a fortunate accident there came to England the Greek archbishop Theodore, who, though then a monk at Rome, had been born at Tarsus in Cilicia, and, presumably before he became monk, had been well instructed both in secular and divine letters, Greek as well as Latin. Accompanied by the African, Adrian (*q.v.*), who was in a monastery near Naples, and, therefore, also knew Greek as well as Latin, they went all over England, not only preaching, but teaching. The Romans of the day despised Greek. Gregory, though he was Papal nuncio in Constantinople for five years, never took the trouble to learn Greek; it is fair to say that he was a monk at the time. But the English, being still new alike to Christianity and to education, had no such views. To them Greek, like Latin, came with all the glamor of the ancient civilization, and there was no danger of their worshipping Zeus or Venus, because they read Homer or Ovid, as was the case with the lingering paganism of Italy or even Gaul. So Theodore and Adrian taught not only the way to read the Scriptures, but the art of meter and astronomy and profane (*secularibus*) literature. Hence it was that whether the grammar schools instituted by Augustine taught the

classics or not, the grammar schools as reformed by Theodore certainly did. Hence it came about that the monastery at Jarrow was redeemed from being a mere abode of English-speaking monks and became the home of Bede and of learning; that Winifred and Willibrod handed on to Germany and Holland, not merely Christianity, but schools in which a classical education was given; and that Alcuin gave back to France all and more than all that France and Italy had given to England through Augustine.

It was not that there was any mysterious virtue in the mere learning of Greek, as some writers on the Renaissance or on modern education appear to think. The knowledge of Greek did not prevent the Eastern Empire from sinking even lower than the Western. It was that the mere fact of bilingual study appears to have a sharpening effect on the intelligence as appears in the superior acuteness of the Welsh to the English schoolboy; and this mere fact of opening up another literature enlarged the horizon of thought and the breadth of mind. Though the study of Greek died down again in the third generation, after Bede, especially in the north, there is reason to think that it lingered on in Kent and Wessex till the Danish invasions began again after Athelstan. The outbreak of English culture, which followed Alfred's reconquest of the south, and the place given to English in Alfred's scheme of education may be largely due to the competition of the second learned language, which made him realize that all learning was not necessarily shut up within the walls of the Latin language, and that as the Greeks prayed and taught in their own tongue, so might the English. It is clear from Alcuin's account of the school at York as taught by Archbishop Albert and himself that the old distinction between the grammar school and the rhetoric school had disappeared. Not that rhetoric itself or logic ceased to be cultivated. But as in the days of Quintilian the grammar school, as he conceived it, limited to teaching grammar and expounding the poets, was trenching on the sphere of the rhetoric school by reading also the historians and teaching the elements of oratory; now that the school was not preparing citizens for the forum, but clerks for the church, rhetoric fell into a secondary place, and, though the art of speaking was still useful for a preacher, it became relegated to a comparatively unimportant position in the school, which, if given a single name, would have been the grammar school. In the same way a modicum of mathematics, only enough to fix the calendar and find the right time for Easter, was taught and a little law, whereas the law schools at Rome and Berytus had been great and separately endowed.

At a Synod in Bavaria in 774 it was ordered that every bishop should establish a school at his see with a learned master to

teach according to the tradition of the Romans. The Synod of Aachen in 789 under Alcuinian influences ordered that not only every bishop's see, but also every monastery, should have schools of readers as well as singers and of writers of correct MSS. But the monastic schools were closed again by the Synod of Aachen in 817. From that time education for others than the monks in the monasteries was exclusively a matter of concern to the secular clergy. Efforts were made from time to time to extend it to the laity, also. From Alcuin's words it would appear that every noble child could be educated in York School, and a letter of Alcuin's shows that Charlemagne tried to effect the same, while Alfred the Great (according to Asser, who, it must be remembered, is probably an eleventh-century compiler) made his earls, thanes, and bailiffs learn grammar, and Alfred himself, in his *Preface to Gregory's Pastoral Care*, definitely set up as his ideal that every English freeman should learn at least to read English, and those who wished should go on to Latin. (See ALFRED, KING.) The Council of Cloveshoo in 747 had indeed expressed a pious wish in this direction, also. But the last invasions of the Northmen in the tenth century, destroying churches and schools wholesale as well as the towns in which they were, wiped out any idea of lay education except in the highest classes and threw back the whole of North Germany, France, and England. The Alcuinian tradition was practically extinguished. Until the conquest of England was finally accomplished by William the Conqueror, learning was at a discount outside Italy.

The Late Middle Ages.—In the seventh and eighth centuries Italy had sunk perhaps lower into ignorance, owing to the monastic and anti-classical influence of Gregory the Great and to the Lombard and other invasions in the North or West of Europe. Gregory had indeed instituted a song school at Rome to teach the Gregorian chant, which may or may not have been an advance on the Ambrosian chant, but was certainly merely ecclesiastical, and contributed not at all to learning except in so far as learning psalms and hymns implied some knowledge of reading, though not necessarily an understanding of Latin. Tested by charters, and it was almost exclusively for composition of legal and diplomatic documents that Latin was still kept up at all, the Latin of Italy was hopelessly barbarous; whereas English charters of the same date, though turgid and involved, are grammatical and fairly good legal Latin.

The Song School.—One wonders whether the schoolmasters (*magistri scholarum*) who signed charters at Milan in 748 and 767 were as one who signed in 809 expressly described himself master, of the song school. It was perhaps from Gregory's song school that the crowds of scholars came, who are recorded as greeting Charlemagne on his triumphal entry

into Rome in 774. At all events, the first educational act noted of Charlemagne is the introduction of Roman song schoolmasters into the schools of Gaul, and in a subsequent quarrel between the foreign and the native singers in 787 he decided in favor of the Romans because Rome was the *fons et origo* of the art. It was only on his second journey to Rome that he is said to have brought back grammar masters, and that in the person of Alcuin the Englishman, not of a Roman. Song schools were recorded as having been established in England at York by Paulinus, in which the art as taught in Kent was practiced, an implication of previous establishment by Augustine at Canterbury, from whence Paulinus brought his song schoolmaster, James the Deacon. Gregory may therefore claim the educational merit, at all events, of establishing the song school as even a more necessary part of medieval education than the grammar school. In all the cathedrals and collegiate churches from the beginning of the seventh century, the song school stood as one of the essential parts of medieval education, not because it softened manners and did not allow them to be brutal, but on the purely utilitarian ground that it was necessary for the church services. Hence the song school extended itself to the parish churches. As it was essential for singing that the choristers should be able to read, the song schools became the elementary schools of the Middle Ages. In the inevitable tendency of the elementary schoolmaster to encroach on the domain of the higher education, we find in the thirteenth and succeeding centuries disputes between the song schoolmasters and the grammar schoolmasters, where both existed, as to whether and how far the song schoolmaster might teach the elements of grammar. It was generally, but not always, settled in favor of the song schoolmaster being allowed to teach the "Donat," or accidence. In some cases, especially after the Black Death in the fourteenth century, we find in some smaller places like Northallerton and Howden in Yorkshire the two schools rolled into one, and one master teaching both grammar and song. In the greater places and churches the two were always distinct and were under different officials of the chapter, the precentor being responsible for the song school and the chancellor for the grammar school. The song school was specially, though not necessarily, confined to churches. The grammar school was specially for clerks and laymen, though choristers were not excluded, and in some cases were made to attend. But their attendance was always a difficulty. So at Lincoln and Salisbury, where in the fourteenth and fifteenth centuries separate grammar schools were established for the choristers, growing gradually out of private tutors appointed to look after them, the grammar school was at first under the precentor, but was recognized as subsidiary

and subordinate to the old, the city or Cathedral Grammar School, under the Chancellor. At Lincoln, after a quarrel with the town council on the subject, it was definitely settled in 1406 that the choristers' grammar school should be allowed, but should not take in any other than choristers or relations of the canons living in their houses; and once a term all the scholars in it were to go down into the town and attend the ancient grammar school and sit there under the teaching and discipline of the grammar school master in token of its superiority. But the song school received separate treatment.

Conditions in Italy.—The Carolingian revival affected Italy as it had France. In 825 an important educational edict was published by the Emperor Lothaire assigning Pavia, Turin, Cremona, Piacenza, Florence, and four other places for central schools to which scholars from surrounding districts, mentioned in detail, were to resort. The exact meaning of this edict has been disputed between Protestant and Catholic historians. It begins by a statement that "as to teaching (*doctrina*), which through the carelessness and laziness of certain rulers is everywhere wholly extinct, it had been decreed that the greatest care shall be taken by those who are assigned by us to teach others in certain places named that their scholars shall become proficient." Giesebrecht and Roger argue that this only refers to religious teaching, to theology, and not to literary or classical instruction. Ozanam applies it to the latter. The unqualified words *doctrina* and *scholastica* point to the latter. Even if, however, the schools were only theological, they imply a preliminary grammar training for those who were to take the Scripture course. The next year, 826, saw the often-quoted conciliar decree of Eugenius II which, complaining that in some places neither masters nor a cure are found for the study of letters (or a grammar school), directs that, in all bishops' sees and in other places where necessary, masters and doctors should be established with schools of grammar and the liberal arts. This is surely merely translating into ecclesiastical law and explaining Lothaire's decree of the year before. It only lays down what was already the practice certainly north of the Alps, though it may have been new south of them. In 853 a constitution of Pope Leo IV says that even if teachers of the liberal arts are rarely found, nevertheless masters of theology and teachers of the ecclesiastical office shall by no means be wanting. In southern Italy, at Naples, Duke Sergius is said to have known both Greek and Latin and to have had his two sons, the elder intended for a soldier as *magister militum* and the younger Athanasius intended for a bishop, educated in both languages. As Bishop of Naples he is said to have founded schools both of grammar and song. The Bishop of Modena, in appointing an archpriest in 908, puts first

of his duties that of keeping a school and educating boys. It was in connection, however, chiefly with the two studies of medicine and law which, though largely, if not exclusively, practiced, at all events in the North, by clerks, in Italy appear to have remained or to have been largely practiced by laymen, and so did not wholly fall under the deadening influence of an exclusively "other-worldly" attitude, that a revival led by Italians began. At Salerno, which was in the Greek-speaking part of Italy, and long retained a connection with the Eastern Empire, the study of medical authors was kept up, and therewith was kept up a knowledge of Latin for other than religious purposes. (See UNIVERSITIES.)

The Rise of Universities. — To Salerno is due the first known gathering of doctors or teachers which is entitled to be called a university, and the fame of which it can hardly be doubted was influential in aiding the establishment of similar gatherings at Bologna in law and at Paris in theology.

Similarly as regards law. In spite of the barbarian invasions, there seemed always to have been some tincture of Roman law in the cities of Italy. Gregory the Great was essentially a lawyer. Alcuin records that law was taught among the other items of the encyclopedia in the school of York by his master, Archbishop Albert, in 736 (*Illos juridica curant cote polare*). After the Lombard invasions in Italy it almost disappeared save at Ravenna, where the connection with the Eastern Empire kept it up and whence it first spread on the revival. The term *scholasticus* for a teacher is probably due to Ravenna. In the days of Gregory the Great a *scholasticus* was not a teacher or a scholar, but a high imperial official, a lord high chancellor, if not a chief justice. But by the tenth century *scholasticus* is used at Ravenna as equivalent with *magister*, to mean what a little later was called a doctor of law, — not so much a teacher of law, but an expounder of it as an advocate, one who lays down the law, — and apparently, as in the case of Portia in the *Merchant of Venice*, the advocates were almost regarded and frequently consulted, if not as judges, at least as *amici curiæ*.

It was at Paris that Lanfranc (*qv*) was born. Lanfranc, like Anselm, coming from Italy, infused a much more secular and rhetorical spirit into the studies of France, and so contributed to the awakening which showed itself in Italy in the union of the Law Schools or University of Bologna and in France which became the University of Paris, at the end of the eleventh century. Both Lanfranc and Anselm, when they became monks and then archbishops, were potent instruments of reaction, and their influence largely contributed to the conversion of the nascent University of Paris from a school of free discussion and unfettered philosophy, into an almost entirely

theological seminary in which logic and philosophy were only studied as a preparation for theology. The free thinkers Berengarius, Roscelinus, Abélard, were crushed one after another. The brilliant anticipation of the Renaissance which produced such scholars and researchers as John of Salisbury, Walter Map, Giraldus Cambrensis, faded away.

The mental gymnastic of dialectic, better perhaps than any other for sharpening the intellect, remained and proved an immense gain to the medieval mind. Its practice at least showed that there were two sides to every question, and it cultivated the habit of argument and to some extent of investigation. It elevated the medieval schools into something more approaching the rhetoric schools of the ancient world. It must never be forgotten that what is spoken of with scorn by later writers as the scholastic system is really nothing more than the system of discussion and argument conducted with a view to and by way of *viva voce* debate, instead of as now on paper. Hence it was keener, closer, and at the same time produced greater heat than our modern discussions by newspapers, magazines, and books. It must be remembered that the same system which produced Anselm and Becket, produced also Wycliffe and Luther.

Church Schools. — The rise of the Universities produced an exhilarating effect on schools in general, if it had the effect of depressing others. There was now no question as in the Carolingian days of an Imperial edict being required to establish three public schools for the whole empire, or of a Papal bull to require every bishop to provide for schools in his episcopal city. In the tenth-century development collegiate churches had spread schools to all the towns considered of sufficient importance to have such institutions. In all the boroughs recorded as built by Edward the Elder, and Ethelfleda, or Athelstan, and which survived to post-Conquest times, there are found, when records begin, collegiate churches with grammar schools attached, such as Bedford, Beverley, Derby, Leicester, Oxford, Stafford, Warwick — it is inferred that they were constituted when the towns were castled or fortified. Foreign examples confirm this. Not only were the collegiates of Nesles and Poitiers famous for their schools, but in Germany and France collegiate churches were multiplied in the same town, and each of them had its school. At Liège, besides the cathedral school of St. Lambert's, there was a school at the collegiate church of the Holy Cross, which proved a model as well as probably gave its name to Harold's foundation at Waltham Holy Cross, at St. Martin's, at St. John's, with which last, in about 1090, there was a fierce struggle for precedence between the rival schoolmasters, which the chapter of the cathedral was called in to settle. So at Cologne, besides the cathedral school there were in the

eleventh century the schools of the collegiate churches of St. Cunibert and St. Gereon. Before the end of the fifteenth century there were no less than eighteen grammar schools in the various collegiate churches and hospitals in that city. The fact that there was an independent collegiate church of St. Geneviève in Paris which had a right to keep a school independently of the license of the Chancellor of Notre Dame, had an important influence in the development of Paris University.

In England, whether through less populousness and wealth or for what other reason is not clear, there was no multiplication of collegiate church schools (*q.v.*) outside London. But in every town of any size there was a collegiate church, or a collegiate as in Hull and Northampton of the chantry priests attached to the various churches; and in York and some other places there were rival schools. In the smaller towns and country parishes the schools were supplied by chantry (*q.v.*) foundations, in which the priest, either by foundation or of his own will to earn money and obtain occupation, kept school. The gilds, too, set up or helped to endow the schools, as in the famous case of Stratford-on-Avon grammar school. The supply of schools indeed was ample and tended more and more as time went on even to outstrip the population. In the foundation of University colleges begun at Paris and imitated within a few years at Salisbury, Oxford, and Cambridge, Bologna, in the thirteenth century gave an enormous impetus to the foundation of collegiate churches, chantries, and hospitals. Every one who rose to rank or wealth in the church, especially in the civil service, felt almost bound to found or augment the church or hospital or chantry of his native place, and therewith his school. The latest phase of this development was when William of Wykeham founded a school as itself a collegiate church at Winchester and was imitated by Henry VI at Eton and a host of others.

Transition to the Renaissance — But as long as the monastic spirit prevailed, and extended to an enforced celibacy of the clergy, education and learning seemed doomed to sterility. There were always a few bold spirits who, like the biographer of Adalbert, Archbishop of Mainz, complained that though philosophy shone in his city and the school flourished, it would be more learned if the keeping of choir did not a hateful evil and the rigor of the church put impediments in the way of learning, for psalm singing and learning don't agree. But the prevailing view was that enforced by Bishop John Grandison of Exeter, in 1357, who complained that the schoolmasters in his diocese took the boys away from reading matins and the hours of the Virgin and, more like gentiles than Christians, hurried them to other schoolbooks, the poets and others. What more than anything else, however, retarded the progress of learning and the

world in general was the asceticism which in the twelfth century finally overcame the freedom of the clergy to marry. Multiply clerks as they might, their learning perished with them, and it was impossible for a learned or literary class to grow up when each successive generation had to start anew from the scions of the unlearned. Consequently there was little advance made until in the Renaissance the lay-folks, beginning with the aristocracy of Italy, followed not long behind by those of other nations, as the example of Henry VI (*q.v.*) shows, betook themselves to learning. Through them only do we get such a foundation deed as that of Bingham asking leave of Henry VI in 1439 to found a college to train grammar school masters; no longer, in the words of Wykeham, because grammar was the gate of science leading to the mistress of all learning, — theology, — but because it led to a knowledge of the laws and promoted intercourse between nations. When a parson and a scholar could plead for learning in these terms and for this object, the Middle Ages were over and the Renaissance and the modern era of education had begun.

MIDDLE SCHOOLS. — See MITTEL-SCHULE.

MIDDLEBURY COLLEGE, MIDDLEBURY, VT — A nonsectarian institution, chartered 1800. The incorporators were mostly Congregationalists of Yale antecedents, but the college has never had any formal ecclesiastical connection. Fellows are chosen for life, and elect their own successors without restrictions. The charter has never been amended. The first president was Rev. Jeremiah Atwater (Yale, 1793), who previously was principal of the Addison County Grammar School, founded on the advice of President Dwight as a forerunner to the college. The first class was graduated in 1802, at which time the first academic degrees conferred in Vermont were bestowed. For ten years the work of the college was done in a frame building, which it shared with the grammar school, but in 1810 Seth Storrs presented a campus, thirty acres on an eminence on the edge of the village. Here the first building was erected in 1815, and later named Painter Hall, in honor of Gamaliel Painter, a founder and benefactor. This building, which is still in use, is one of the best examples of early collegiate architecture. A large chapel and recitation building were erected in 1836, and Starr Hall, a dormitory, in 1861. The growth of the college was steady under Presidents Davis (1809-1817) and Bates (1818-1839), but was retarded during the able administration of Benjamin Labaree (1840-1866) by dissensions over the slavery question

and various religious issues. The Civil War nearly emptied the college of students, and the institution was slow in recovering. President Cyrus Hamlin (1880-1885), founder of Robert College, proved a vigorous administrator. Under Ezra Brainerd (1885-1908) substantial endowments were received. In 1883 women were admitted, and since 1895 their number has approached that of the men. Since 1888 \$2400 a year has been received from the state for scholarships for thirty Vermont students. The centennial of the college was celebrated in 1900. In 1911 a fund of \$200,000, one half for endowment, which was initiated by a conditional offer of \$50,000 from the General Education Board (*q.v.*), was completed. The Vermont legislature of 1908 established a department of pedagogy for the training of high school teachers by an annual appropriation of \$6000, which was increased in 1910 to \$13,600. The income in 1911 was \$59,113.30. The resources are (1911): permanent funds, \$499,672.64; annuity funds, \$36,500; plant, \$335,987.37; reserved for buildings, \$45,961.51; total, \$917,154.56. The college offers classical, scientific, and pedagogical courses, and confers the degrees of A.B., B.S., and A.M. in course. The faculty (1911) numbers twenty-six, of whom nine are full professors. The present enrollment is 403, or, excluding the summer session, 305. The attendance doubled in the six years preceding 1911. The college was on the first list of accepted institutions of the Carnegie Foundation (*q.v.*). J. M. T.

MIDLAND COLLEGE, ATCHISON, KAN.

— A coeducational institution founded in 1887 by the General Synod of the Evangelical Lutheran Church. Academic, collegiate, and music departments are maintained. Fifteen units are required for regular entrance to college. Degrees (A.B., B.S., B.L.) are conferred on completion of the appropriate courses. The enrollment in 1911-1912 was 145. The faculty consists of fifteen members.

MIÉGE, GUY (1644-1718). — He was educated at Lausanne, and about 1658 became an "academist." He came to London in 1660. After traveling for a time in Europe, Miège again appears in London in 1678 as a teacher of French and geography. In 1678 Miège published his *New French Grammar*, or a *New Method of Learning of the French Tongue*. This work he describes as a new method for learning French. The *Grounds of the French Tongue* (1687) covered the same field, but omitted the geographical discourse. The teacher of French (1) must speak true French; (2) should have good learning; (3) should have

good skill in the English language, "because without it it is impossible he can teach by the grammar"; (4) should be thoroughly acquainted with the textbook he uses. In 1677 was issued a *New Dictionary, French and English, with another, English and French*, in which he acknowledges his indebtedness to the *Dictionary Royall French and Latin* of the Jesuit Father, Pomey. (See *INDICULUS UNIVERSALIS*.) He introduces here derivatives in their alphabetical order, but with reference to the primitives. This work was followed in 1688 by a much larger one, the *Great French Dictionary*.

Miège names Cardinal Richelieu's establishment of an academy as a ground for the need of a new dictionary, for the Academy had driven from the French "exercises" and "irregularities," and these remained in even the best of the current French-English dictionaries. He quotes Howell (*q.v.*) as saying that the English language is so made up of the French that he needs to study French if only to speak good English.

Other educational works of Miège were: (1) for the teaching of French: *A Dictionary of Barbarous French* (taken from Cotgrave's Dictionary, 1679), *A Short Dictionary English-French and French-English* (London, 1685), *Nouvelle Méthode pour apprendre l'Anglais* (London, 1685), *Nouvelle Nomenclature Française et Anglaise* (London, 1685); (2) in Geography: *A New Cosmography or Survey of the Whole World* (London, 1682); and (3) for teaching English, a textbook: *The English Grammar*, 1688, as to which Miège seems to have agreed to a division of labor, himself instructing French people in English, and Abel Boyer instructing the English in French.

MILDE, VINCENZ EDUARD (1777-1853).

— One of the most prominent Austrian educators; was born at Brünn, Moravia, and received his early education at the gymnasium of his native city. In Vienna he studied theology, and, in 1800, he began his activity as a parish priest. From 1802 to 1804 he directed the religious instruction in several Vienna schools. In 1805 he was made Bishop of Leitmeritz, and in 1831 Archbishop of Vienna. In

MILITARY ACADEMY

both positions he did much for the cause of popular education and for the training of priests and teachers. In his will he directed that the whole income of his estate be used for the support of poor priests and schoolmasters. F. M.

MILITARY ACADEMY. — See **MILITARY EDUCATION.**

MILITARY EDUCATION. — Prussia. —

In recent times the Prussians were the first to develop a comprehensive scheme of military education. Under the strong influence of their disasters in 1806 they went to work with brilliant leaders in a reform of the entire military system, which they developed in comparative quiet until the three wars which they fought between 1864 and 1870 showed their preeminent position as a military nation. Since then the world has become their willing pupil, and all great modern armies have taken their lead. Those who have not done so owe their neglect to political and other conditions which their military advisers do not cease to regret. The method followed by Germany is, therefore, a standard, and the others are either repetitions or more or less successful adaptations of that system.

In Prussia the control of so much of the military education as is not connected with service with troops is, with one exception, vested in a single officer, the Inspector-General of Military Education and Training. The exception is the War Academy, which, being a staff college, is under the supervision of the Chief of Staff of the army. The Inspector-General is assisted by two permanent boards, (a) the Board of Studies, in matters connected with the general system of instruction, and (b) the Supreme Examination Board, in regard to examinations and qualifications for commissions. The system of education is still further centralized by placing all cadet schools under command of a major-general, the war schools under a lieutenant-general, and the infantry schools under a major-general. At the same time each of the institutions has a board of studies, which is charged with the general control of the course of study and with the duty of making suggestions for its improvement. It is noticeable that a large proportion of the instruction is in the hands of civilians, who also have a certain proportion of places on those boards.

The entire system of military schools may be divided into four groups. (A) Schools for the preparation of candidates to reach the grade of officer. (B) Schools for the completion and improvement of the education of commissioned officers. (C) Schools for noncommissioned officers and men. (D) Schools in the duties of officers belonging to special services and other noncombatant arms.

A. *The Schools for the Preparation of Candidates for the Officers' Commission* are of two kinds,

MILITARY EDUCATION

(a) Cadet schools (*Kadettenhäuser*) which prepare for the ensign examination. They are of two grades, senior and junior. The course of studies covers nine classes. The term is one year for each class. The course is assimilated to that of the royal schools and gymnasia, or public schools of the country, and graduation in the upper first class is a qualification for admission to a university. The cadets are under military instruction and discipline, but purely military subjects have no place in the curriculum.

The cadets are also divided into four classes called conduct classes. On entering they are assigned to the third class. They are promoted into the second class for good conduct and into the first class for exceptionally good conduct. The higher conduct classes enjoy special privileges and favors, especially in the matter of liberty. The fourth or lowest class is a disciplinary section. Cadets who pass into this section are under close supervision, and enjoy no privileges or liberty.

The junior cadet schools are eight in number, and are located at Goslin, Potsdam, Wahlstadt, Bensburg, Plön, Oranienstein, Karlsruhe, and Naumburg. The total capacity of these schools is about 1700 cadets. The members of the corps are largely sons of army and navy officers, and receive subsistence, clothing, and tuition either free or at a nominal charge. Although intended for military service, there is nothing compulsory about the institutions. Admission is subject to a qualifying examination in elementary subjects. Entrance may be obtained at the age of ten years. The average number of hours spent in classroom is twenty-eight hours per week.

The junior schools keep the cadets through the first five classes, and transfer them to the senior cadet school at Gross Lichterfelde, when they have successfully completed the course of the upper third class. Thus, under normal conditions, they would enter the senior cadet school at the age of fifteen years, and would finally graduate at nineteen years. There are 1000 cadets at Gross Lichterfelde, and they spend thirty hours per week in class.

Service in the Ranks. — Normally the next stage in the progress of the cadet after passing through the cadet schools is to take the ensign's examination and to serve as a noncommissioned officer for six months with troops, but they may do this at an earlier period. At the close of the second year of the upper cadet school those cadets who have the requisite age and physical development are admitted to the ensign's examination, and, if successful, receive a conditional appointment as brevet ensigns (*Porte-épée-Fähnriche*), and enter at once on service in the ranks.

Likewise at the same period of the course in the cadet schools a "select" class of especially meritorious cadets is formed, which at once begins a course of preparation for the officers'

examination. The course consists entirely of military subjects and languages, and is very much the same as that of the war schools. This class, which is small, receives officers' commissions directly, forming an exception to the rule that candidates must first pass through the brevet ensign grade in the ranks, and that they must be voted upon by the regimental officers.

The policy of making the cadet school a part of the military educational system has been much discussed. Its opponents urge that the character of the education is inferior to that of the civil schools, that the methods of discipline are so mild that the boys will get no idea of military life from the experience, that the boys so educated become unfit for the occupations of civil life, that it is an error to put boys into the military profession at an age when their taste or fitness for it has not been developed, that it tends to create a special military class, that favoritism is shown to the cadets over those who enter from civil life pure and simple. On the other hand, the friends of the system claim that by taking the boys at an early age, advantages are gained, which outweigh these objections. As a result of the discussion the decision seems to be in favor of increasing the number and capacity of the cadet schools rather than diminishing them. At present the cadet schools do not provide more than one third of the officers necessary for the army, and the balance is made up in other ways.

A young man who wishes to enter the army as an officer, without passing through the cadet schools, must first be nominated by the colonel of the regiment in which he desires to serve. He then serves as a private for six months, with certain privileges in recognition of the fact that he is a candidate for a commission, and he is called an "advantageur," or aspirant officer. During this time, usually at the beginning, he must pass an educational test. This may be satisfied by the production of a diploma either from a gymnasium or royal school (technical school) of the first class. The examination of those who do not possess evidence of having pursued a sufficiently high course of study embraces principally: (1) a good knowledge of the German language; (2) a translating knowledge of a foreign modern language; (3) arithmetic; algebra, up to equations of the second degree; use of logarithms; plane geometry and trigonometry. The instructors are directed to arrange the course according to the ability of the pupils; they are forbidden to force them to take up lines for which they have no talent; memorizing is discouraged, and useless detail is eliminated. The aim of all education is to train the character as well as the mind, and to do this the above method is considered best.

After at least five months' uninterrupted service in the ranks, the candidate is passed upon by his company, battalion, and regimental

commanders, from whom a certificate is necessary, setting forth that judging from his physical, mental, and moral qualities, his deportment, zeal, and the degree of practical knowledge of the service he has acquired, they deem him worthy to continue in the service with a view to advancement.

(b) *War Schools (Kriegsschulen)*.—The advantageurs and cadets not of the Selecta class gain their military instruction at a war school, after having fulfilled the necessary requirements of the ensign examination and service in ranks.

There are ten war schools in Prussia, situated at: Anklam, Cassel, Dantzig, Engers, Glogau, Hanover, Hersfeld, Metz, Neisse, Potsdam. At these schools a corps of 172 officers is stationed, and the aggregate attendance of students is one thousand. Admission may take place as early as seventeen and a half years, and the term lasts ten months. The course of studies is strictly military, even languages and mathematics being excluded. It includes: tactics, the science of arms, field fortifications, topography, regulations.

Those ensigns who successfully pass the war schools are reported to the "Superior Military Examination Committee," with a view to taking the officers' examination. The members of the Selecta, having followed a course exactly similar to that of the war schools, are also admitted to the officers' examination if deemed proficient. After the examination they return to their regiments for further service, generally several months.

An exception to the rule of attendance at war schools is made in favor of students who have attended a university, a technical high school, or a forestry academy for at least a year. Young men of this class, though required to undergo the practical test, the result of which is described in the certificate of their superior officers, may, upon the recommendation of the latter, be admitted to the officers' examination without previous attendance at a war school and without serving a full term of six months in the ranks. Still another exception is made in favor of officers of the reserve transferred to the active army. The aggregate number of those who enter under these exceptions is quite small.

The nomination to the sovereign of a person who has passed the officers' examination for appointment as second lieutenant must be accompanied, except in the case of the Selecta class of the cadet schools, by a statement of the officers of his regiment or independent battalion that they regard the nominee as fit to become their comrade, and that he possesses the practical knowledge of the service which is indispensable to an officer. If the majority of the officers refuse to join in such a statement, the next senior ensign is at once voted on; but if the election of a candidate be opposed by a minority only, the reasons of the latter for their dissenting view are submitted to the com-

manding general, who decides what weight, if any, is to be attached to them. In order that officers may have an opportunity to form an estimate of the mental and moral qualities of the ensigns, the latter, during a part of their service, are admitted to the officers' mess and are otherwise brought into frequent contact socially and officially with the officers.

B. Schools for Commissioned Officers. — The schools of this class partake of the character of postgraduate schools or schools of application.

(a) For cavalry there are two riding schools, one at Paderborn (*Offizier-Reitschule*) and one at Hanover (*Militär-Reit-Institut*). The school at Paderborn is for cavalry officers only, and has a staff of five officers and instructors and forty-one students. Attached to the school there is a detachment of ten noncommissioned officers, eighty-four men, eighty officers' horses, and fifty troop horses. The school at Hanover centralizes the methods of horsemanship throughout the empire. It is under the supervision of the Inspector General of Cavalry and of the Cavalry Board. The personnel consists of twenty-three officers as instructors and staff.

There are one hundred and thirty-three student lieutenants at the school, of whom ninety-one belong to the cavalry and forty-two to the field artillery. The course is usually one year, but the most proficient are retained for another year to practice a more extended course. Among the novel methods of the school is the hunting, with a government pack of hounds. Since 1888 all higher officers of cavalry go to Hanover each year to take a course of a few weeks in the chase and in jumping.

(b) For field artillery there is a firing school at Jüterbog, which trains officers from all field artillery regiments as instructors in gunnery. The personnel consists of twenty-four instructors, and there is an instruction regiment (*Lehr-Regiment*) with forty-four officers. The course lasts for five months, and the instruction is under the control of the Inspector General of Field Artillery. In 1910 it was proposed to send seventeen general officers for a short course at the school.

(c) The infantry schools are under a major general who is subordinate to the Inspector General of Military Instruction. Those infantry schools which are intended for officers are: (1) The Military Gymnastic Institute at Berlin, which trains officers of cavalry, artillery, and infantry to act as athletic instructors and fencing masters. It has a staff of four officers. (2) The School of Musketry at Spandau, which has three courses: (a) The information course for field officers of cavalry and infantry, lasting ten days. It was attended by 118 officers in 1909. (b) The instruction course for captains and lieutenants of cavalry and infantry, lasting twenty days. It was attended by 452 officers in 1909. (c) The course for noncommissioned officers. It was attended by 540 noncommissioned officers

of cavalry and infantry in 1909. The object of the school is to instruct officers in target firing and in the use of small arms so that they may act as instructors when they return to their regiments, to hunt out discrepancies in the present firing regulations and in the methods of instruction in the different parts of the empire, and to suggest methods by which they may be removed; to watch the development of small arms and small arms practice in foreign armies; to answer any questions of the Minister of War on the subject; and to plan and examine sites for target ranges. Attached to the school are twenty-one officers, of whom six remain throughout the entire year, and the balance do duty with their regiments during the winter. It was proposed during 1910 to send eleven generals to the school for a short course. (3) There is a battalion of instruction at Potsdam, designed to coordinate the methods of instruction throughout the army. To it are attached about seventy-five officers and five hundred and sixty-four men.

(d) The Foot Artillery Firing School (*Fuss-artillerie-Schiess-schule*) is at Jüterbog. It is under control of the Inspector General of Foot Artillery, and has for its object the training of officers and noncommissioned officers of all foot artillery regiments as instructors in gunnery. It has twelve instructors, and is provided with an instruction battalion (*Lehr-bataillon*) of nineteen officers.

(e) The Technical Military Academy (*Militär-Technische Akademie*) at Berlin is under the supervision of the Inspector General of Military Education, and is commanded by a lieutenant general, with twenty-two officers as assistants. Its object is to complete the professional instruction of officers of foot artillery, engineers, pioneers, and communication troops. It also includes more extended courses in the higher scientific branches of armament and the engineer and communication services. There are three divisions of the course: (1) Armament (with eighty-seven lieutenants of artillery and infantry). (2) Engineering (with forty-seven lieutenants of engineers). (3) Communications (with twenty-two lieutenants of cavalry, artillery, infantry, train, and communication). The majority of the officers leave at the end of two years. The third and fourth years' course is followed by a small number of those who are most proficient.

(f) The War Academy (*Kriegs-Akademie*) at Berlin, founded in 1810, is the highest military school of the system. The general object of the institution is to raise the scientific spirit of the army; its special object is to give such an education to the most talented officers of all arms, after they have proved themselves possessed of the practical qualifications of good regimental officers, as will fit them not only for appointments on the staff, but for all responsible positions of high rank, for the command of regiments, for employment as instructors of military

schools, and for all duties which require scientific attainments, both in military and in general subjects, of a higher degree than those ordinarily possessed. The War Academy is located in Berlin, under the control of the Chief of the General Staff of the Army. The immediate command is vested in a general, who is assisted by a board of studies and a personnel of twenty-three officers as instructors and staff. There are 480 students. The course embraces three consecutive years.

An officer who takes the examination for the War Academy must have had at least three years' service as an officer, and must have satisfactory reports from his commanding officers as to his familiarity with the practical part of his duties, his health, strength, and character, conduct, and pecuniary affairs. The entrance examination is intended to ascertain whether the applicant is sufficiently advanced in general education and knowledge on special branches of learning to enable him to attend the lectures of the academy with profit. It is also designed to determine whether his powers of discrimination and judgment are such as to give promise of further satisfactory development. Accordingly the subjects for examination are so chosen as not merely to test the memory, but also to afford the applicant the opportunity to demonstrate his ability to express his thoughts in a clear, coherent, and effective manner. The examination embraces the military branches of tactics, applied tactics, the science of arms, permanent and field fortifications, study of ground, and topographical drawing, and the following branches of general science, — history, geography, mathematics, and French (optional).

Reference to previous papers shows that the candidate for the War Academy must make good use of his time in order to fit himself for this examination. There is no repetition of subjects covered in previous schools, but he is called on to draw upon the fund of information which he has acquired by service with troops.

The course of instruction continues on the general lines indicated by the entrance examination, with the option of mathematics or a language, which may be either English, French, Russian, or Japanese. At the close of the course the work of each officer is described with much care and particularity, but no class standing is announced.

C. Schools for Noncommissioned Officers and Men. — In Germany the ordinary noncommissioned officer rarely becomes an officer. Occupying an intermediate position between the officers and the troops, they form a corps by themselves. Much care is bestowed on them. For noncommissioned officers there are seven preparatory schools at: Annaburg, with a commissioned staff of eight officers; Bartenstein, with a commissioned staff of eight officers; Griefenberg, with a commissioned staff of eight officers;

Jülich, with a commissioned staff of eight officers; Neubrisach, with a commissioned staff of ten officers; Weilburg, with a commissioned staff of eight officers; Wohlaw, with a commissioned staff of eight officers.

Candidates may be admitted at the age of fifteen years. The course lasts two or three years, depending upon the previous education of the students. These preparatory schools have the same relation to the noncommissioned officers' schools that the cadet schools have to war schools. About one fourth of the noncommissioned officers are provided by schools which are located as follows: Biebrich, with a commissioned staff of eighteen officers; Ettlingen, with a commissioned staff of eighteen officers; Jülich, with a commissioned staff of twelve officers; Potsdam, with a commissioned staff of twenty-three officers; Treptow, with a commissioned staff of twenty-two officers; Weisenfels, with a commissioned staff of twenty-two officers; Marienwerder, with a commissioned staff of eighteen officers. There are about 4000 men in these schools.

D. Schools for Auxiliary Services — These may be enumerated as follows. King William Military Medical School (*Kaiser Wilhelm-Akademie für das Militärärztliche Bildungswesen*) at Berlin. Military Veterinary Academy (*Militär-Veterinar-Akademie*) at Berlin, with thirteen officers as instructors and staff. Military Horse Shoeing School at Berlin (*Militär-Lehrschmiede*) personnel of seven officers. Other schools are in Breslau, Frankfurt, Hanover, Karlsruhe, Königsberg. Military orphan schools at Potsdam and Pretzsch, with four officers. Cavalry Telegraph School (*Militär-Telegraphenschule*) at Berlin, with ten officers as staff. Wallmeisterschule at Strassburg, with three officers as staff. School of Fortress Construction (*Festungsbauschule*) at Charlottenburg, with four officers in charge. Artificers' School (*Ober-Feuerwerkerschule*) at Berlin, with eighteen officers detailed as staff and instructors. School for Sons of Soldiers (*Militär-Knaben-Erziehungsanstalt*) at Annaburg, with five officers assigned to it for duty.

The military schools of Saxony and Bavaria, except in minor particulars, are exact duplicates of those of Prussia; and thus complete the educational system of the German Empire.

Remarks on Prussian System. — From the foregoing, the conditions of military education in Germany may be summarized as follows:

- (1) Proof of a fair general education is required either by the certificate of a public school or by passing the ensign's examination.
- (2) From five to six months' service in the ranks, as a minimum.
- (3) Ten months' professional instruction at a war school.
- (4) Proof of professional knowledge by passing an officers' examination.
- (5) Acceptance by the officers of the candidate's regiment. Thus there is a double examination and two probationary periods of service with troops.

In Germany the principle of deferring the strictly military part of a man's education until after a good grounding in general education is well established. No serious attempt is made to give a special military education at an early age. The junior cadet schools give a mild sort of discipline and some elementary military exercises, but not enough to partake of the character of military education. Up to the age of seventeen or eighteen the future officer receives the same kind of an education as a civilian, and in a great majority of cases gets it at the ordinary public schools of the country. The only exception is in the *Selecta* class of the cadet schools, which receives military instruction before actually joining the service, but in this case the special instruction does not commence until the age of seventeen. After the candidates have had service in the ranks, however, they receive most careful professional instruction in the war schools. The course of these schools is essentially of a practical character, comprising only strictly military subjects and excluding such studies as mathematics and even languages.

A notable point of contrast between the Prussian and the other systems is the absence of competition in the former. There is, in fact, universal objection to competitive methods because it is the desire to discourage everything like the schoolboy feeling among officers, partly from fear that it may lead to jealousy and ill feeling among them, and diminish the spirit of comradeship to which so much importance is attached in the German army. Other claims are that competition prevents individuals from devoting their talents to subjects for which they have a natural taste, that it encourages an abnormal attention to useless details, gives undue prominence to the man whose chief ability lies in the memory, and the greatest objection urged is that it is impossible to make an examination that will test all the qualities which go to form military capacity. All examinations are made of a qualifying nature, and in furtherance of the same general idea promotion is not made by selection, but by seniority. To form an estimate of the capacity and general character of all officers there is provided an elaborate system of inspections and reports. If an officer is passed by a junior in promotion, it is a sign that he is no longer considered competent and he must retire from the service. Usually they are given previous warning on this point. It is supposed that this system cultivates the mind, directs the attention to broad principles, and promotes good feeling.

In the German system it will be observed that mathematics does not hold a high place in the training of an officer. A knowledge of mathematics up to trigonometry is all that is required for admission to the army, but the subject is not taught in the war schools in connection with the examination for an officer's commis-

sion. In the scientific schools, it is true, some proficiency in mathematics is required, but it is not of a high standard. The principle seems to be that the higher branches of mathematics can only be studied with advantage by a few who have real talent in that line, and that it is a waste of time to force the study upon those who have not a taste for it.

More importance seems to be given to the moral and physical qualifications of an officer than to actual performance in classroom. A knowledge of at least one foreign language is a necessary condition for admission. No particular prominence or encouragement is given to the technical services and scientific corps. It is, in fact, rather a disadvantage for those who seek advancement through the General Staff to comply with the requirements of the technical schools and then prepare themselves for the War College course of three years. As promotion is based on seniority as a rule, there are only two ways by which a man can get ahead of his comrades of the same grade and age. (1) The *Selecta* classes of the cadet schools are able to get an advantage of about a year. (2) Officers who are appointed to the General Staff as captains have their commissions antedated three years, and this same advantage may be gained a second time, if, as majors, they are again selected on the General Staff. Apparently only a few of the General Staff come from the scientific corps. It is not considered that these cases are violations of the rule against competition. As stated before, selections are based on reports showing character and mental and physical qualities combined.

The most notable feature in the German system is the close connection of the schools with the army, whereby the information gathered in the school is constantly applied in the everyday work of the army.

France.—Military education is controlled by a Central Executive Committee entitled "Permanent Instruction Board of Military Schools," at the head of which is a general of division. He is invested with the right to control the discipline of the schools, military education, and the general organization of instruction, and also the initiation of all measures relative to the material organization of the schools and the elaboration of programs of instruction and education.

A. Schools for the Preparation of Candidates for the Officer's Commission.—The junior cadet schools of the military class have been for the most part abandoned because of the conviction that it was not an advantage to begin a military education at an early age. The only survivor of this class is the Military Orphan School (*Prytanée Militaire*) at La Flèche, which continues to educate the sons of men who have done meritorious service. It has 500 students, of whom 300 have their expenses entirely paid and 120 partly paid by the government. En-

trance is at the age of ten years by a qualifying examination. Graduates receive the degree of Bachelor of Science, and are prepared to enter Saint-Cyr and the Polytechnic. Although under military discipline, with a military personnel of forty-five officers, and although intended to prepare young men for the military profession, there is no obligation of that kind. In the ninety-five years of its existence something more than half of its graduates have been officers of the army.

Preparation for the officers' commission may begin for those who enter from civil life in two schools, the Polytechnic (*L'Ecole Polytechnique*) at Paris, and the Special Military School (*L'Ecole Spéciale Militaire*) at Saint-Cyr, in both of which service of one year in a regiment is required. Since 1907 there is a strictly competitive examination, requiring graduation at a high school and also special work. The polytechnic school at Paris prepares cadets for artillery, engineers, and other technical services in the army and navy. The course lasts two years, beginning at the age of sixteen or seventeen. It gives a preparatory civil education, almost entirely of a mathematical character, and is a scientific school of high class under military discipline. Its graduates are commissioned as second lieutenants in the corps for which they have prepared. The military element is not prominent. During summer there are two drills per week only. In fact it is not a *military* school, although three fourths to two thirds of its pupils enter the army. It is a sort of mathematical university, a degree at which is a necessary condition of admission to certain departments of naval, military, and civil services. The staff and personnel consists of seventy officers and numerous civil instructors. There are 350 cadets, of whom 100 are at the expense of the State.

The Special Military School at Saint-Cyr is a companion institution to the Polytechnic, preparing cadets for the cavalry, infantry, and marines. The course is two years, beginning at the age of sixteen or seventeen years. The requirement of one year previous service in a regiment has resulted in the suppression of military exercises in ranks at the school. The rifle is rarely carried. Instruction is essentially practical, with the object of forming instructors and officers, and no longer almost exclusively soldiers. The one year's service with regiments is used in the case of cavalry cadets to develop in important proportions their general and military knowledge. They join the class of non-commissioned candidates for Saumur in the courses of history, geography, and topography, and are besides employed in the training of young horses. There are about 900 cadets, furnishing about one third the officers necessary. Its graduates predominate in the higher grades and at the Staff School. About half are pay cadets, the remainder free. The military and instruction staff is sixty-five officers.

The recruitment of the corps of officers is further provided for by three schools for non-commissioned officer candidates who are deemed worthy of advancement. In each of these the requirements of admission are two years' service and an educational requirement equal to that offered by the higher primary schools. It is expected that in this way the candidates will be able to enter the service with the same degree of preparation as their comrades from Saint-Cyr and the Polytechnic. The course in each is about one year. (1) The Cavalry School constitutes a section of the Cavalry School of Application at Saumur. (2) The Artillery and Engineer School (*L'Ecole Militaire de l'Artillerie et du génie*) at Versailles. It has a staff of twenty-two officers. (3) The Infantry School (*L'Ecole militaire d'infanterie*) at Saint-Maixent, maintains a staff of thirty-one officers.

B. Schools for the Completion and Improvement of the Education of Officers.—(a) The Cavalry School (*L'Ecole de Cavalerie*), at Saumur, has a number of courses, so that it combines the school of application with the preparatory school for officers and noncommissioned officers. The courses are: (1) School of application for cavalry, consisting of forty-five officers, one from each brigade, preparing for the duties of instructors in equitation. (2) School of application for artillery and engineers, consisting of forty officers, preparing to act as instructors in equitation. (3) School of application for second lieutenants of cavalry on graduation from Saumur, consisting of eighty to ninety officers, completing their instruction in equitation.

The school has fifty-six instructors and permanent staff officers. The course is one year.

(b) The School of Application for Artillery and Engineers (*L'Ecole d'application de l'artillerie et du génie*), at Fontainebleau, furnishes the advanced military and technical instruction needed in these arms. The school is under the command of a general officer with the assistance of forty-seven officers. The course is two years.

(c) School of Musketry (*L'Ecole normale de tir*), at Chalons, has for its object, first the preparation of officers to act as instructors of musketry, and second, as a station for general experimental purposes in matters pertaining to musketry. It has several courses, varying from six weeks to three months and a half. The school is conducted by a personnel of sixteen officers.

Closely connected with the School of Musketry at Chalons are the schools of application for lieutenants of cavalry, infantry, and engineers, one at Camp Reichard and the other at Camp Valbonne, with courses of about six weeks, and a corps of instructors of about ten officers.

(d) School of Explosives and Mines (*L'Ecole d'application des poudres et salpêtres*), at Paris,

is recruited entirely from graduates of the Polytechnic and is intended for an advanced study by engineer officers.

(e) School of Gymnastics (*L'École normale de gymnastique*), at Joinville-le-Point, trains a limited number of officers and noncommissioned officers as instructors in gymnastics and fencing, in order to insure a uniform method of instruction in all that concerns these exercises throughout the army. The course lasts six months. There are eight officers permanently detailed.

(f) School of Aerial Navigation (*L'École d'aérostation*) gives technical instruction in the service to a certain number of detailed officers.

(g) Artillery Schools (*L'École d'artillerie*), one for each brigade of artillery, with the object of completing the instruction of the officers of this arm and of noncommissioned officers aspiring for promotion.

Annexed to the school of this class at Poitiers is a practical course for majors and captains of artillery, lasting from three to six months according to the rank of the officers. It includes the study of the changes in the construction and employment of field artillery at home and abroad.

(h) School of Field Fortification (*L'École des travaux de campagne*). This school is attached to the school for the first engineer regiment at Versailles. Its object is to train officers of infantry in the construction of field works in time of war. The course is four weeks.

(i) The War School (*L'École supérieure de guerre*), at Paris, has a two-year course, thirty-three instructors and directors, and 280 students. It is open to the best students of the Polytechnic and to competition by graduates of Saint-Cyr. Upon graduation the students serve two years with cavalry, two years with infantry, one year with artillery before they are eligible for staff appointment. The day's work begins at six or seven o'clock and continues until five p.m., with the exception of one and one half hours. Much of the time is taken up with outdoor work, and the evenings are free.

As an adjunct to the war school an additional class for higher officers is about to be started to study the duties of high command. The course will be six months, and the first class will consist of twenty majors and lieutenant-colonels.

C. Schools for Noncommissioned Officers and Privates. — Preparatory schools are provided for the sons of soldiers, pensioners, and deceased officers, where education and instruction is given at the public expense to train them as noncommissioned officers. The State assumes a guardianship in a way over these children (*enfants de troupe*), and gives them an allowance in money for the earliest age, and at the age of thirteen admits them into one of six military preparatory schools. The schools are located as follows: For cavalry at Autun; for artil-

lery and engineers at Billom; for infantry at Rambouillet, Montreuil-sur-Mer, Saint-Hippolyte-du-Fort, and Andelys. The aggregate number of students accommodated at these schools is 3000, with 34 officers in charge of instruction and discipline.

A school for soldiers' orphans (*Orphelinat Hériot*), established by private endowment, takes boys at ages from five to thirteen years, and serves as a preparatory school for the higher class. It is under military supervision and control.

Through out the army there are in every regiment schools for the soldiers (*écoles régimentaires*). The schools are of two kinds: (1) primary, for the illiterate, and (2) for noncommissioned officers who desire promotion. The cavalry school at Saumur provides several courses for noncommissioned officers and men, as follows: (1) School for noncommissioned officers preparing for officers' commission, consisting of over 100 men who have gained admission by competitive examination. (2) The school for saddlers, with 100 workmen. (3) The school for sixty to eighty apprentice farriers, detached from regiments, to which they return with a warrant as farrier sergeant. (4) School for cavalry telegraphers, consisting of two groups of 100 each, detached from regiments, to take the course each year. (5) The school of veterinary students who come to complete previous training before entering the army; there are twenty-six to thirty of them.

D. Schools for Auxiliary Services. — (a) The School of Administration (*L'École d'administration*) at Vincennes is intended to instruct specially qualified noncommissioned officers with a view to advancement to the grade of officers in the supply departments and sanitary service. (b) School of Sanitation Service (*L'École du service de santé*), at Lyons, supplements the medical course of students and gives them the necessary military training. The course is six months under a corps of nineteen instructors. (c) School of Application for the Sanitary Service (*L'École d'application du service de santé*), at Paris, receives the graduates of (b) and imparts theoretical and practical instruction.

Austria-Hungary. — *A. Preparatory Schools for Officers.* — Preparation for military life begins early. As in Germany, the young men go through a series of military preparatory schools, beginning at the age of ten years. The schools, called military technical schools, are similar to the corresponding public schools designed to lay a foundation for a scientific education. They are of two classes, named respectively Upper and Lower Schools. The Lower Schools (*Unter-Real Schulen*) have a three-year course, and are located at Enns, Steiermark, Fishau, Moros Váshrhely, St. Pölten, Kősneg. They have about 140 officers on duty and 900 students. The military orphan school at Hirtelberg is of this class.

The Upper Schools receive the graduates of the former for a four-year course. They are situated at Kismarton and Mährisch Weisskirchen, with about 70 officers and 450 students.

The military academies receive the graduates of the Upper Schools for three years. Preparation for the academies may, however, be obtained elsewhere, in public schools or private educational establishments. The age of admission would be about seventeen years. The expenses are either borne by the State, which is the most common case, or they make full or half payments.

The Theresa Academy at Neustadt is the institution which educates officers for the cavalry and infantry. It has fifty officers and 450 students. The Technical Military Academy of Vienna prepares for artillery, engineers, and other special services. It has forty-six officers and 279 students. The graduates of the academies are commissioned directly into the army. The recruitment of the corps of officers is further provided by a large number of cadet schools, with a two-year course. There are fifteen of these for infantry, some of which are also open to the cavalry, with an aggregate of 345 officers and 2400 cadets. They are located at Vienna, Budapest, Prag, Königsfeld, Pozsony, Innsbruck, Temesvár, Nagyzeben, Liebenau, Łobzów, Carlstadt, Marburg, Kamnitz, Lemberg, and Kassa.

The cavalry also has a special cadet school at Mährisch Weisskirchen, with 24 officers and 150 students.

The artillery school is at Traiskirchen, with 50 officers and 350 cadets.

The pioneers have a school at Hainburg, with 25 officers and 160 cadets.

After graduation at the cadet schools the cadet is assigned to a regiment as a cadet, with actual or honorary position as noncommissioned officer. As vacancies occur they may be appointed cadet officers' substitutes (*Cadet Officers Stellvertreter*) in which they exercise the function of officers, and associate with them without actually holding rank as officers. Having completed a probationary period in this position, they may be nominated for commissions, after having received the approving vote of the officers of their regiments.

B. Schools for Officers. — (1) The Special Technical School of Artillery, Engineers, Building Construction, and Civil Schools (*Technische Militärfachkurse*) at Vienna. (2) School of Musketry (*Armeschiessschule*) at Vienna. (3) Artillery School of Fire (*Artillerie Schiessschule*) at Vienna. (4) Riding Masters' School (*Militär-Reitlehrerinstitut*) at Vienna. (5) Fencing and Gymnastic Institutes' School (*Militär-Reit-und-Fahrlehrerinstitut*) at Schlosshoff bei Marchegg. (6) School of Instruction in Riding and Driving (*Militär Fecht und Turnlehrerinstitut*) at Vienna. (7) War School (*Kriegs-schule*) at Vienna, has a permanent staff of 26 officers and 136 students.

C. Schools for Enlisted Men. — Schools for one-year volunteers are established in each regiment, and divisional schools in each division.

D. Schools for Auxiliary Services. — (1) The Military School of Administration (*Administrative Militärfachkurse*) at Onna. (2) Military Medical School (*Militär ärztliche Applikations-schule*) at Vienna. (3) Veterinary School (*Tierärztliche Hochschule*) at Vienna. (4) Cavalry and Infantry Telegraph Schools (*Telegraphenkurs*) at Tullin.

Italy. — The military schools of Italy are under supervision of a Superintendent or Director of Military Education.

A. Schools for the Preparation of Candidates for the Officers' Commission. — Preparation is usually made at the junior cadet schools or the military colleges of Rome and Naples (*Collegi Militari*), both conducted under the same regulations and with the same entrance examinations. The earliest age at entrance is thirteen years. The course is about the same as for boys of corresponding age at certain of the public schools, and takes four years. Entrance is competitive.

The military colleges are preparatory for the senior cadet schools, of which there are two: the Military School (*Scuola Militare*) at Modena for cavalry and infantry cadets, and the Military Academy (*Accademia Militare*) at Turin for engineer and artillery cadets. Admission to these schools is competitive, as in the colleges, and they are also open to graduates of civil schools, and deserving graduates. The course in the military school at Modena is two years. No mathematics is taken by the cadet, except what is included in the subjects of physical and natural sciences. On graduation a cadet receives his commission as an officer of cavalry or infantry. The course at the Military Academy of Turin is three years, and the sciences occupy a prominent part in the schedule. On graduation a cadet receives his commission as an officer of artillery or engineers, but antedated one year in order to adjust the rank. It will thus be seen that cadets who pursue the usual course will be officers at a minimum age of nineteen years. About one third of the vacancies go to meritorious non-commissioned officers, for whom a special course is provided at the school of Modena, with a term of two years.

B. Schools for the Completion and Improvement of the Education of Commissioned Officers. — Upon graduation from the military schools the candidates are commissioned and are sent to the schools of application for their branch of the service. The second lieutenants of cavalry go for a course of ten months to the Cavalry School of Application (*Scuola di Cavalleria*) at Pinerola, immediately after graduating at Modena. A second course provides for training of officers as riding instructors, and a third course is given to officers preparatory to passing their examination for promotion. The second

lieutenants of heavy artillery and engineers go for two years longer to the School of Application for their arms (*Scuola d'Applicazione d'Artiglieria e Genio*) at Turin. The second lieutenants of field artillery enter the Artillery School of Fire (*Scuola Centrale di Tiro d'Artiglieria*) at Nettuno; in the infantry the lieutenants go to the School of Fire (*Scuola Centrale di Tiro di Fanteria*) at Parma. Several additional courses are provided:—

(1) Course for preparing cavalry and infantry officers to enter the War School at Turin, — four months. (2) Course for preparing infantry officers for their promotion, — three months. (3) Course for students of the lowest class of the war schools, — forty days. (4) Course for noncommissioned officers who seek commissions in the accounting departments, — two years. The Royal School for Carbineer Officers (*Scuola Allieri Officiale Carabinieri Reali*), and the military fencing school (*Scuola Magistrale Militari di Scherma*) are at Rome. The War School (*Scuola di Guerra*) at Turin is the highest school, and is designed to qualify officers who have had three or four years' service for duty in the General Staff. Entrance is competitive for cavalry and infantry, but no examination is required for those who have graduated at the higher schools of application for artillery and engineers. The course takes three years, and is conducted by 44 officers with 165 students.

C. Schools for Noncommissioned Officers and Men. — The most important is the above-mentioned section of the Modena School, which prepares intelligent and deserving noncommissioned officers who aspire to the grade of officers for admission to the military schools.

D. Schools for Auxiliary Services. — The principal schools of these kinds are: The Military Sanitary School of Application (*Scuola d'Applicazione di Sanità Militare*) at Florence. The Military Geographical Institute (*Istituto Geografico Militare*).

Great Britain. — *A. Schools for the Preparation of Candidates for an Officer's Commission* are to a large extent limited to two, — the Royal Military Academy at Woolwich, and the Royal Military College at Sandhurst. Entrance is at the age of seventeen or eighteen years. Admission is strictly competitive, except for a small number of King's cadets, who are subject to a qualifying examination only. Graduation from the sixth form in English secondary schools, which is equivalent to entrance to a university, qualifies for Sandhurst and Woolwich, but there are also numerous private schools which prepare for both.

The Royal Military Academy at Woolwich prepares cadets for artillery and engineers. It has a one-year course, and accommodates 200 cadets, with 40 officers. The cadets are organized and held under military discipline. The course of instruction is largely taken up with military subjects.

The Royal Military College at Sandhurst is the preparatory school for the cavalry and infantry branches. The course is one year, mostly devoted to military matters. It contains 400 cadets and 36 officers. The amount paid by cadets depends upon ability to pay, and ranges from £150 per year to nothing. King's cadets receive a gratuity from the age of thirteen in order to prepare them for entrance examination. The weekly routine takes up forty hours per week or about five hours for class and study and three hours daily for drill. In a year there are about three months of vacation.

Among the novel disciplinary methods to be noted is the rule that cadets have an allowance of pocket money which, in amount, depends on cadet rank. It is taken away when under punishment. Cadets reduced to ranks are not graduated unless they are reinstated at least to the grade of corporal.

The characteristic features of the Woolwich and Sandhurst schools are the brief periods of instruction and the exacting competitive standards of admission. The ordinary arguments for and against these methods continue to be heard, with the general result that the tendency is to increase the length of the course.

Among the schools having a military character which serve as preparatory institutions are the Duke of York's Royal Military School at Gaston, the Royal Hibernian Military School at Dublin, and the Queen Victoria School at Dunblane.

In addition to the royal schools described, entrance to the regular corps of officers can be obtained: (a) by nomination of recognized universities to candidates fulfilling the academic and military qualifications, (b) by competition to officers of auxiliary and colonial forces.

B. Schools for Commissioned Officers. — (a) The Ordnance College at Woolwich has four courses: (1) the ordnance course for officers of the army and marines, (2) the gunnery staff course for officers and noncommissioned officers, (3) the master gunner's course, (4) the artificer's course. The course lasts one year, with thirteen officers permanently assigned and twenty-six students.

(b) The Engineering School at Chatham has three courses: (1) for officers of the Royal Engineers, (2) for officers and enlisted men of the Royal Engineers, (3) for officers and noncommissioned officers and men of the line. The officers for instruction and administration number seventeen.

Other schools of this class are: (c) Cavalry School at Netheravon, takes thirty officers for six months. (d) School of Gunnery at Shoburyness. (e) Mounted Infantry School at Longmoor. (f) School of Musketry at Hythe. (g) School of Gymnastics at Aldershot and Curragh. (h) Staff College at Camberley. The Staff College performs the ordinary mission of a college of its kind. The college maintains

a permanent personnel of sixteen officers and ninety-eight student officers.

C. Schools for Noncommissioned Officers and Enlisted Men are conducted in connection with a majority of the schools noted. In addition there are numerous garrison schools, which furnish certificates of three kinds. Promotion to the rank of corporal requires a third-class certificate, to the rank of sergeant a second-class certificate, and the other more important noncommissioned officers must have a first-class certificate. (a) The School of Cookery, Aldershot, has a course of three months for noncommissioned officers. (b) The Royal Military School of Music is at Kneller Hall for training of bandmen of all ranks. (c) For training of assistant instructors in riding there are establishments at Canterbury, Woolwich, and Aldershot. (d) A course for saddlers is provided at Woolwich dockyard. (e) A course of instruction for soldiers to qualify as chiropodists is formed. (f) A course for tailors is provided at the Royal Army Clothing Factory.

D. Schools for the Auxiliary Services — (a) The Royal Army Medical College at Grosvenor Road, S.W. (b) The Royal Medical Corps School at Aldershot. (c) The School of Signaling at Aldershot. (d) The Army Service Corps School at Aldershot. (e) The Army Veterinary School at Aldershot. (f) The Balloon School at South Farnborough has twelve officers for a seven weeks' course. (g) The School of Electric Lighting at Plymouth and Portsmouth for officers of engineers and heavy artillery. (h) The School of Economics provides a six months' course in commercial and business training.

There are a number of military schools and colleges in the colonies, as: (a) The Indian Staff College, at Quetta, with forty-nine student officers. (b) The Indian Cavalry School at Saugor. (c) The School of Musketry at Bloemfontein, S.A. (d) Schools of Musketry at Pachmarli, Satara, Changlela Gali, Mayengo, India. (e) The Royal Military Academy at Kingston, Canada.

Comparison of the system of military education in Great Britain with that of other countries shows less time devoted to study and less exacting qualifications for the grade of officer than in most countries.

Switzerland. — This country presents many novel features in her military and educational system, because she is the only country in the world which has formed an efficient scheme of national defense based entirely on a militia system. The preparatory training of the Swiss youth for military service begins early. Between the ages of ten and twenty years a course of gymnastics and elementary drill is made obligatory at public schools and elsewhere. To this is added rifle firing for the older boys, so that much of the "rawness" of the recruit has disappeared before they present themselves for enrollment. The principle that every

able-bodied male citizen must help to defend the State applies to all between the ages of twenty and forty-eight years, who are not exempted by law. The first twelve years are passed in the active army, and the next eight years are put in with the first reserve, or *Landwehr*. Finally, the eight years up to the age of forty-eight are in the second reserve, or *Landsturm*. Thus the active army is divided into twelve classes, according to age. Each year the young men who reach the age of twenty years report for duty as recruits. At the same time the class of those who pass the thirty-second birthday go into the first reserve, while still another class finish their term of service in the first reserve at the age of forty years.

A date is fixed when the young men of the recruit class present themselves for enrollment. They are then examined; the unfit are excused, the fit are assigned to the most appropriate branch of the service. They are armed, equipped, clothed, and instructed in the school of the recruits for ninety days in the cavalry, seventy-five days in the artillery, and sixty-five days in the infantry. At these schools the skeleton regiments, battalions, or companies necessary to give the entire body of recruits a technical organization are first formed by calling upon the newly appointed officers and noncommissioned officers in sufficient numbers. This is then an important part of the training of others besides the recruits.

Immediately after finishing his recruit course the soldier takes his place in the active army as a member of a company located near his home. Subsequent service of instructed troops is as follows: For cavalry, privates, and corporals, eight annual trainings of eleven days each; for infantry, seven annual trainings of eleven days each; for artillery, seven annual trainings of fourteen days each. The artillery, infantry, and other troops of the first reserve, cavalry excepted, have one annual training of eleven days. Thus the total service as a private of cavalry is 178 days, 184 for artillery, and 153 for infantry. These days are in addition to the days of reporting and dismissal. When they are counted, the total will be from eighteen to twenty-seven days more. It is to be observed that a day is counted for a full eight hours of hard work, in which all the time is occupied in a manner that has been carefully studied and planned beforehand. Each special arm has a course of its own. The butchers, bakers, teamsters, and others so essential to a field army, are organized, drilled, and worked in the way they should go.

Volunteer shooting clubs are subsidized by the government when they use the military firearm according to military rules. They are an important feature of the military system; every soldier between the ages of twenty and forty must either fire a course at one of these meetings once a year or attend a three days' course of practice under military supervision.

MILITARY EDUCATION

For officers and noncommissioned officers the course is extended to thirty days. This training is in addition to other military service, and of course greatly increases the aggregate time given to the state by each man. In 1905 there were 3694 of these shooting clubs in that small state, with a membership of 220,147. The United States, being thirty times more populous than Switzerland, would, at the same rate, have 100,000 such clubs with a membership of six million and a half members, at an annual cost of two million dollars. That six million and a half membership will also represent the proportional number of armed, trained, and organized soldiers, maintained at a cost of half that of our own military establishment.

Advancement in the army depends upon ability and the time given to learning the duties of a soldier. Promotion to the grade of corporal comes on the recommendation of superiors, after the candidate has satisfactorily passed his recruit course and followed the course of training prescribed for the new grade. The sergeants are taken from the corporals, so that, after four years, a man has not ordinarily been able to get his commission as an officer. The principal schools for noncommissioned officers last thirty-five days for cavalry and artillery and twenty days for infantry, with corresponding courses for other arms. After qualifying as noncommissioned officers, they at once act as instructors at the recruit schools of the next class, and then take their regular annual course with the active army, so that in the year when a man becomes a corporal of cavalry he has 136 days' service, 124 days in artillery and 106 days in infantry. This course was taken by 2095 men in 1906.

Noncommissioned officers, or soldiers who are declared qualified, enter a preparatory school for officers lasting eighty days for cavalry and infantry, 105 days for artillery, and corresponding periods for other services. They are appointed lieutenants if satisfactory, and immediately practice their functions as such at a recruit school, and again follow it up with the annual training with their regiments. So that the lieutenant, in the year when he qualifies, devotes 181 days to military service in cavalry, 194 in artillery, and 156 in infantry. Seniority rules in promotion to first lieutenant. Above and including the rank of captain, promotion is by selection among the best officers.

Numerous schools are provided for officers. After reaching the rank of lieutenant, officers must remain four years in each grade, at least, so that they cannot reach the grade of colonel in less than twenty years. Before becoming captains they must successfully pass through the thirty days' course for captains and command a company at a recruit school. Before being promoted major, they have a course of fifty days, and command a battalion of recruits. Lieutenant-colonels and colonels have tactical

MILITARY EDUCATION

exercises without troops for eleven days every other year. Candidates for the general staff have a seventy days' course. The general staff is the branch upon which the higher duties of the military profession are placed; their special work lasts from two to three months at a time. Thus, in an average case, it will take about forty-five days each year devoted to military duties in order to get regular promotion, and it will take about eight years to a captaincy.

About 220 instructors of all kinds are required to give the necessary direction to the various branches of military training. They constitute about the only permanent establishment in the army, and are under pay at all times. A portion of the general staff may be included in this. Notwithstanding the apparently exacting nature of the calls for military service in a country where it is fulfilled at the same time that a man pursues his ordinary vocation, it has been calculated that working hours are reduced only 1 per cent thereby.

Turkey. — Turkey has a good system of military education, commencing with the primary grades and continuing up to a complete war school course. It was introduced with other military reforms by the distinguished general, Von der Goltz, who succeeded in a very short time in giving the country a first-class army.

A. Preparatory Schools. — There are twenty-eight junior schools of this class, of which six are situated at Constantinople and the others are distributed among the principal cities. The boys wear uniforms, but are not quartered in barracks, receive no military instruction, properly speaking, and are under no obligation to enter the army unless they are otherwise bound by the law. The program of instruction simply conforms to that of the ordinary primary school. The course of instruction lasts four years. The head or director of each school is a military officer who has a number of officers as assistants, but most of the teachers are civilians. The military colleges are seven in number, and may be classed as senior cadet schools. The course is three years, and its character is distinctly military, most of the teaching personnel being military, and considerable military instruction being imparted. These colleges are usually placed at the headquarters of the Army Corps districts. Although specially designed to prepare for the army, there is no obligation to serve.

Those cadets who are desirous of entering cavalry and infantry join the Cavalry and Infantry School (*Mekteb-i Harbi*) at Constantinople. On graduation the pupils are commissioned in the infantry and cavalry as second lieutenants, while the unsuccessful are sent to join a regiment with the rank of first sergeant.

The School of Artillery and Engineers (*Mu-hendis-Khané-i berri i humayoun*) at Constantinople prepares officers for the artillery and

engineers of the line of the army, as well as for fortress artillery. It has a military and scientific course which lasts four years. On graduation successful cadets join the army as second lieutenants. Those specially recommended at the end of the course, not more than one tenth of the class, undergo a further technical course for three years, on the completion of which they are promoted to be captains.

B. Schools for Officers.—The best of the graduates of the Cavalry and Infantry School, as well as a few of the higher graduates of the Artillery and Engineers' School, are assigned to take the course of the Staff School (*Erkiam i harbé mektebi*). The course is three years, and graduates are assigned to the General Staff with the rank of captain. The curriculum compares favorably with the other war colleges in Europe.

C. Schools for Noncommissioned Officers.—As only a small proportion of the officers come from the military schools, the balance is furnished by the promotion of meritorious non-commissioned officers, for whom there are appropriate schools.

D. Schools for Auxiliary Services.—The Military School of Medicine (*Mekteb i funoun thabie i chahané*) at Constantinople has a six years' course. Graduates enter the Sanitary Corps with the rank of captain, and take an additional two years in a military hospital.

A veterinary section is attached to the Cavalry and Infantry School, and graduates receive the rank of captain veterinarian.

China—The plans for an imperial army were made in 1907, and contemplated the formation of thirty-six divisions of troops, two for each province, before 1912. The scheme has met with numerous delays in execution, but the progress made has been remarkable. At present the number of students of the officer class is about 10,500, distributed as follows.—

At twenty-nine junior cadet schools, 6000 students; at three senior cadet schools, 1550 students; at one school for nobles and members of the royal family, 200 students; at one school for the rapid instruction of officers, 1140 students; at six provincial schools for rapid instruction of officers, 810 students; at one school for instructors, 120 students; at one provincial war college, 120 students; total, 9940 students.

There are also 500 officers and military students in Japan and thirty in Europe. Two graduated at West Point recently.

There are as yet no schools of application, and it is found necessary to provide officers at an exceedingly rapid rate for the new divisions from schools of instruction, in which the course is necessarily abbreviated. It is expected that the great Central School for Officers will be ready in 1911 and that the War College will be opened in 1916. Under present plans the army will need annually about 1500 officers, which will be completely provided by the national schools. This will be done in

1912, when there will be nearly 13,000 students, distributed as follows:—

In junior cadet schools 6000 students, or 2000 per year; in senior cadet schools 3600 students, or 1800 per year; in war schools 3200 students, or 1600 per year.

The ordinary progress of the Chinese officer will be as follows: entrance at a cadet school at age of fifteen years; at junior cadet schools, three years; at senior cadet schools, two years; service in ranks, four months; at war schools, eighteen months; service in ranks, six months. Thus at the age of twenty-two years and four months he becomes an officer. After two years with his regiment he may enter the War College, if specially selected for the honor, and will graduate in two years more.

Here again we have the German system. In addition to the officers' schools there are everywhere schools for noncommissioned officers and men. The school in fact is one of the most important parts of the soldier's life, and the army is today the most important factor in the introduction of western thought and learning throughout the country. Thousands of young men are learning to be officers, and the battalion schools of the army of 250,000 men are devoting two hours of study each day along with six hours of drill. The military profession is now honored where formerly it was despised. It is sought by the most favored youth of the land. Everywhere a sentiment of national patriotism is taking the place of former indifference. If improvement continues at the same rapid rate, it will not be long before China will be one of the greatest military powers in the world.

Japan.—In all military nations, and in Japan particularly, the army is a school of the highest quality in which the habits of discipline and self-respect are formed and the principles of honor and patriotism are taught. In the public schools there is a military color given to the conduct and to the sports of the students which prepares them for their military service. Bushido is taught, and Honor occupies the first place in the list of studies. (See JAPAN, EDUCATION IN.)

The military educational system is based on the German.

A. Schools for the Preparation of Candidates for the Grade of Officer are of two kinds, (a) Cadet Schools (*Chuo Yonen Gakko*), which prepare for the ensign (*Shikuan Kohosei*) examination, and (b) the War School (*Shikuan Gakko*), which prepares for the officers' examination.

(a) Cadet Schools are of two grades, a senior and a junior grade. The junior cadet schools are six in number, and are located at Tokyo, Osaka, Sendai, Nagoya, Hiroshima, and Kumamoto with an aggregate of about 127 instructors and administration officers and 900 students. Pupils are admitted at the age of thirteen years, and remain three years. Many of them are sons of officers and soldiers, and the same argument is made in Japan as in other countries for and

against their continuance. The additional objection is made that their expense is excessive, costing three million yen per year.

At the end of three years the cadets are transferred to the senior cadet school at Tokyo, where the course is for two years. The Tokyo institution has about 530 cadets and a corps of 76 officers and instructors, a part of whom are attached to the junior cadet school at the same place. About 80 per cent of the cadets pay their own expenses. The five years at the cadet schools may thus be supposed to have been completed at the eighteenth year.

The cadet schools furnish less than half of the candidates for officers, so that provision is made for candidates for commission direct from civil life. They enlist as one-year volunteers or candidates for commissions, with the approval and consent of the colonels of the regiments in which they desire to serve. These candidates enjoy certain privileges and at the end of the year of service they take the examination for ensign, or they are appointed without examination, if they possess a diploma from a civil school of sufficiently high grade. Having reached the grade of ensign, they take their place with the graduates of the cadet schools for the next step.

(b) The candidate school for officers (*Shikwan Gakko*) at Tokyo corresponds to the war schools of many other countries, and receives the ensigns for one year. It is commanded by a major general, assisted by 104 officers, and accommodates about 720 students, divided into six sections according to whether the cadets are to enter the cavalry, field artillery, infantry, engineers, heavy artillery, or train. Upon graduating, their candidacy is passed upon by the officers of their regiments, and if the result is favorable they are commissioned as officers by the Emperor.

B. *Schools for Commissioned Officers, or Schools of Application.* — (a) *The Cavalry School of Application (Kihei Jisshi Gakko)*, at Tokyo, has a term of one year with two courses, (1) Tactics, for captains and lieutenants, (2) Equitation and Hippology, for lieutenants and sometimes for noncommissioned officers. Probably officers and noncommissioned officers of the artillery and train are also admitted. At the close of the first year the best are selected for a second year as instructors. There are about 33 instructors and 136 student officers at this institution.

(b) *The Field Artillery Firing School (Yasen Hohei Shageki Gakko)* has a course of eight months for captains and one of four months for lieutenants of field artillery and mountain artillery. There are about twenty instructors and twenty-two students.

(c) *The Infantry School of Application (Toyama Gakko)*, at Toyama, has a term of about one year, and three courses: (1) Tactics for captains and lieutenants of infantry, and sometimes of engineers and heavy artillery; (2) Gymnastics,

firing, and musketry for lieutenants and some noncommissioned officers of all arms; (3) Music course for musicians. The school has 45 officers in the permanent personnel and 145 officers as students.

(d) *Artillery and Engineering School of Application (Hoko Gakko)*, at Tokyo, is commanded by a major general, assisted by fifty-nine officers, and it instructs 230 students, who are second lieutenants. Although the course is usually one year, the best students are given a second year, and at the close of the second term the best are again designated for study abroad. There are courses in field and heavy artillery and engineering.

(e) *The Heavy Artillery Firing School (Juhohei Shageki Gakko)* has three courses: (1) for captains and lieutenants of artillery, eight months; (2) for captains and lieutenants, four months; (3) for captains and field officers who have completed studies in the telegraph battalion and for noncommissioned officers who desire to study electricity. It has a staff of nineteen officers and fifty-four students.

(f) *The Staff College (Dai Gakko)*, at Tokyo, tops the system, with a three-year course. It is commanded by a lieutenant general, with a staff of 46 assistants and 150 students. It dates from 1883.

C. *Schools for Noncommissioned Officers and Enlisted Men.* — In addition to the schools for ensigns and certain selected noncommissioned officers, there are many other schools for enlisted men.

(a) *The Artillery Master Workman's School* has five courses: (1) Pyrotechnic section, (2) Master Saddlers' Sections 1 and 2, (3) Master Armorers' Sections 1 and 2, (4) Master Wheelwrights' Sections 1 and 2, (5) Master Blacksmiths' Sections 1 and 2. (b) *Veterinary School (Jui Gakko)* at Tokyo, for farriers, has a five months' course.

All army divisions have probationary schools for officers, aspirant officers, and noncommissioned aspirant officers.

D. *Schools for Officers of Auxiliary Services.* — (a) *The Intendance School (Keiri Gakko)*, at Tokyo, for officers, probationary officers, and intendance cadets. It has a staff of 29, and 131 students for about two years. (b) *The Army Medical School (Guni Gakko)* at Tokyo. (c) *The School of Military Topography.*

In 1876 when the new army was fairly started there were 2131 students in military schools; in 1893 there were 2602 students; in 1908 there were 2755. This will evidently be increased to correspond to the increased size of the army since the Manchurian campaign.

United States. — A. *Officers' Preparatory Schools* in the United States are confined to two classes. The first class consists of a single school, the Military Academy at West Point. Cadets are admitted at the age of seventeen on nomination by a congressman or by the President of the United States, the number of can-

WEST POINT MILITARY ACADEMY.

Copyright, W. T. Little and Co.

didates allowed to each being regulated by law. The course lasts four years. A qualifying examination is required, or a certificate of graduation at a public school of good standard. All expense is borne by the government. The Military Academy closely resembles the military scientific and technical schools of other countries, where cadets are prepared for engineers, coast artillery, and other scientific branches of the service. Its prototype in Europe would be the Military Academy at Modena, in Italy, or the Polytechnic School of France.

The West Point system developed by itself, and probably was little influenced by other schools. One of its most distinctive features, for which great merit has been claimed, is due to the provision in the law of 1812 which prescribed that cadets shall "be trained and taught all the duties of a private, noncommissioned officer and officer." The result is to give instruction in the duties of all arms of the service. In other countries this part of an officer's military education is usually given in two probationary periods of service in the ranks with troops, and that the duties of all arms are not learned by all officers. Much unjust criticism of West Point has been due to ignorance of its place in military education. Always a preparatory school of a high class, it has never been a war college. Its greatness is due to the high character of its graduates, and not to the course of study pursued by its alumni. The higher duties of command must be learned in another school. The suggestion has been made that perhaps it is time to defer to foreign experience in the plan of the Military Academy, and to form each class into two sections, one an Engineer-Artillery section and the other a Cavalry-Infantry section, each with a course of study appropriate to future service.

The second class of cadet schools is composed of certain civil schools in which "Military Science and Tactics" forms a part of the curriculum. It is a large class of nearly one hundred institutions, although only ten of them have the privilege of furnishing commissioned officers to the army. At these schools there are ninety-two officers detailed as military instructors.

At the inspection of 1910 22,147 students were present. About 10 per cent of the attendance in 1909 were at ten schools rated as "Distinguished," and another 10 per cent were at strictly military institutions. About 15 per cent had target practice on the range. A part of the attendance consists of boys under fifteen years of age, and in this respect these schools are like the junior cadet schools.

Under the provisions of General Orders, No. 231, War Department, Nov. 16, 1909, these institutions are divided into five classes, as follows:—

Class A.—Schools or colleges whose organization is essentially military, whose students are

habitually in uniform, in which military discipline is constantly maintained, and one of whose leading objects is the development of the student by means of military drill, and by regulating his daily conduct according to the principles of military discipline.

Class B.—State land grant or agricultural colleges established under the provisions of the act of Congress of July 2, 1862, which are required by said act to include military tactics in their curriculum.

Class BA.—Any college of Class B which attains the state of efficiency required for schools or colleges of Class A shall be classed as BA.

Class C.—All schools or colleges not essentially military which maintain a course of military instruction equal or superior in character and hours of instruction to that required of institutions of Class B.

Class D.—All other schools or colleges at which officers of the army may be detailed and which do not maintain a course of military instruction equal to that required of institutions of Class B, and at which such instruction is regarded as nominal.

Institutions, not exceeding ten, whose students have exhibited the greatest application and proficiency in military training and knowledge during the year are designated annually as "Distinguished Institutions."

B. Schools of Application.—These are provided for every branch of the service.

(a) The Mounted Service School at Fort Riley, Kansas, for officers and noncommissioned officers of the Cavalry and Field Artillery, has three courses. (1) Training school for officers. (2) Training school for horseshoers and farriers. (3) Training school for bakers and cooks. It has ten officers as staff and military instructors, and thirty-six student officers. The course is one year.

(b) The Coast Artillery School at Fort Monroe, Va., has a two-year term divided into three courses: (1) Regular. (2) Advanced. (3) Enlisted specialists. It has an instructional staff of sixteen, and twenty-four student officers.

(c) The Engineering School at Washington Barracks, D.C., has a course in civil engineering and a course in military engineering, with a term of one year, five instructors, and a class of fourteen officers.

(d) The Army School of the Line at Fort Leavenworth has four courses in a year of time: (1) Military Art. (2) Engineering. (3) Law. (4) Languages. It has twenty-four officers in the staff and as military instructors, and thirty-six students. An engineering school of the line is about to be formed at the same place. A portion of the instructors are assigned also to the Army Staff College, to be mentioned later.

(e) A School of Musketry for Cavalry and Infantry is provided at Monterey, Cal.

At all military posts there are garrison

schools for officers, in which a great amount of work is prescribed.

(f) The most advanced schools of the army are the Army Staff College, Fort Leavenworth, Kan., with a course lasting one year and a class of twenty-three; and finally the Army War College at Washington, D.C., with a permanent personnel of eight officers and twenty-one students, for one year. The War College course may be compared with that of the third year at the German *Kriegs-Akademie*, the Staff College course with the second year, and the Army School of the Line with the first year at that institution.

C. All posts are provided with *schools for enlisted men*, but attendance is not compulsory. Schools for bakers and cooks are at Washington Barracks, D.C., and at San Francisco, Cal. Schools for saddlers and for battery mechanics of Field Artillery are located at Rock Island, Ill. At many of the officers' schools there are courses for noncommissioned officers, as noted.

D. *Schools for Auxiliary Services.* — (a) An Army Signal School at Fort Leavenworth, Kan., instructs fourteen officers every year.

(b) An Army Medical School at Washington, D.C., maintains a personnel of ten officers as staff and instructors, and sixty students.

The notable features of military education in the United States are the lack of coordination between the different institutions, and the fact that graduation at a war college is not an indispensable requirement for the general staff.

A scheme by which the military departments of the civil schools may be available in the plan of national defense is a matter of importance. Many of these schools compare favorably with the preparatory military schools of other countries, and they ought to be of great service to the country.

In no country of the world are officers required to spend more time on military education than in the United States, or to maintain a higher standard. It has been suggested that the standard is too high in respect to the scientific knowledge required from officers of all arms of the service. If there are faults in the military system, they are not in the military education, but rather in the lack of coordination, in the obsolete methods of promotion, in the difficulty of obtaining units at war strength for practical work.

Other American States. — Canada maintains a Royal Military College at Kingston, which furnishes a few officers to the regular army of Great Britain and also to the local reserves. Entrance is secured by competition, the course is three years, and the Corps of Cadets numbers about 100.

In the Mexican army there is a system of compulsory military education, strict attention at the classes being enforced. The soldiers are for the most part Indians, and when they join the ranks are almost without excep-

tion illiterate. They are given instruction in reading, writing, arithmetic, natural sciences, history, drawing, and singing. For officers there is the Military School at the Castle of Chapultepec, which provides about one third of those who receive commissions.

In Chile there is a very good system of military education prepared under German influences. A. The preparatory schools for officers consist of: (1) The Cadet School (*Escuela de Cadetes*). (2) The Military School (*Escuela Militar*). B. The schools for officers are: (1) The Cavalry School (*Escuela de Caballeria*). (2) The Artillery School, firing included (*Escuela de Artilleria*). (3) The Infantry School, including musketry, gymnastics, and fencing (*Escuela de Infanteria*). (4) The War College (*Le Academia de Guerra*). C. The schools for enlisted men are: (1) Preparatory School for Noncommissioned Officers (*Escuela Preparatoria de Sub-oficiales*). (2) Noncommissioned Officers' School (*Escuela de Sub-oficiales*). All of the schools except the War College are under the control of the Inspector General of Education. The War College is under the Chief of Staff.

The scheme of military education of Argentine, like that of Chile, is based on German models and is complete and comprehensive.

In other South American and Central American states the scheme of military education is in various stage of development, with a constant tendency to improvement.

Military Educational Methods. — Most of the educational systems just described are devoted to purely academic instruction, and might just as well be given at any civil school. The use of giving a military character to the preparatory schools has often been disputed, but the idea that a certain amount of military training and discipline is beneficial for youths of every age seems to be gaining. This kind of military training is far from being military education, and might also be obtained in the ranks or in volunteer companies. Both the academic education and the military training or drill are therefore considered necessary before a man becomes an officer. The actual duties of commanding men in gradually increasing numbers must be learned later. The Military Academy at West Point is probably the finest preparatory school of this kind in the world.

After entering the body of officers the purely professional part of military education begins, and this is the particular function of the schools of application and the staff schools or war colleges. Some of the advanced schools for the scientific branches continue to hold much of their technical character, but the scholastic element is quite absent in the schools where officers are sent to learn the higher duties of their profession.

It would be quite easy to fill the course of these schools with the pedantic military learning of many centuries. The mass of stuff of this kind is immense, and was greatly increased

after the Napoleonic wars by numerous commentators who claimed to have discovered in many fantastic rules and maxims the secret of his success. It soon became evident that most of this would have to be put aside, and that military education would have to follow another line.

As war is one of the most ancient and honorable of all the vocations of man, it strikes us at once as remarkable that it should have been so long and successfully conducted without the paraphernalia which in comparatively recent years have been thought necessary. The criticism is just, but easily explained. The wars of mobs and strong men were characterized by deceit and perfidy or by drill and discipline, and were won by the side which showed most proficiency in one or the other. The armies were small and easily handled. The world was often at the mercy of inferior races, ridiculously small in numbers, neither great in courage nor wise in mind. But the age of invention changed all this. The invention of gunpowder increased the length of each man's arm, brought the knight to a level with the peasant, and made new varieties of skill necessary for success. The invention of steam made it possible to feed and assemble greater armies than ever before. The policy of universal liability to service, quick mobilization, and peace training has given us the "Nation in Arms." To train officers for their new responsibilities, so much greater and more complicated than ever before, is the object of military education.

To teach men their duties in war by peaceful means without giving them the experience of war was the greatest difficulty to be met. In other words, to give them practical instead of theoretical methods of instruction was the important end of all instruction. Practical methods of instruction had indeed been found and long practiced by all other professions. The schools of medicine, electricity, law, engineering, and others, of late years have constantly improved and developed the practical course. They have reached the point where theory and practice go hand in hand, teaching principles by practical examples, and sending out graduates from their universities who are ready to begin the active practice of their profession.

The difficulties of giving a practical military training in time of peace disappear on an analysis of the situation, which shows: First that most of the situations requiring practical knowledge by officers can be studied apart from the battle itself and even away from the presence of troops. Second, that one thing should be learned at a time, following the sequence of events as they would present themselves in actual service. Third, that by a proper selection of examples for study an officer will be able to gain a variety of experience closely resembling that obtained in real war.

This, therefore, is the applicatory or deductive system, involving the study of concrete cases

instead of the abstract study of principles. The principle and the illustration may be considered together, but it is better to study the example first and decide on the principle afterwards. It is like the method of the child in learning to speak the language before learning the grammar, for here we study the campaign first and pick out the principles afterwards, thus reversing the former methods.

It will be apparent that our system has decided advantages over the actual school of war. During war the ground, the troops, the killed and wounded, conflicting reports, the sense of responsibility, the nervous strain, are all crowded upon us at once with a thousand variations. In our peace system every distracting influence is excluded, and every subject except the one proper to the case in hand.

Taking account only of the duties of officers, they may be divided into two classes — those conducted indoors and those conducted in the open. In the first class are map problems and map maneuvers; in the second class are staff rides or terrain exercises and maneuvers. Noticing them in the order named, there are map problems which are simply military situations stated in the form of problems for solution, and solved by the aid of a map. It is logical to consider them first, because the officer sees the map before he sees the ground, studies it, and makes his plans beforehand. The result of the study causes a decision to be reached which is stated in the form of an order to the troops. This order is the foundation on which the entire structure of command is built. To acquire the habit of issuing correct and sound orders takes much time and is reduced to a beautiful system. It makes no difference what the size of the command may be. The map maneuver comes next, and resembles in a way the ancient game of chess. The checkerboard is represented by a map of large scale, the pawns are replaced by blocks or markers indicating tactical organizations, and the rules are governed by the well-known powers and limitations of troops in moving over varying conditions of ground. The map maneuver tests the correctness of the decision made in solving the map problem. By these simple means many varieties of military questions are usefully studied, practiced, and decided.

The first kind of outdoor exercise has been called a war ride, although it may be a walk as well. Its distinctive feature is that the map of the map maneuver is here replaced by the real ground. The troops remain absent because of the rule to learn one thing at a time, and it is well known that the officers would otherwise have their attention largely devoted to personal direction of the troops. The object is still to practice the officers in making quick and accurate decisions, and for this the troops may continue to be imaginary.

Finally the troops themselves appear upon the stage, and the officers may now be said to

be ready to take up the mechanical duty of handling the men. This part of the military education is called the maneuver stage. It is also progressive in its character, beginning with an enemy whose position is outlined at first by flags and markers, ending at last with troops actually represented as an enemy, with both sides firing blank ammunition. This is the last rehearsal in time of peace for the serious drama of war. In most respects it gives a practical demonstration of war, lacking only the element of danger, which cannot be supplied in peace.

Abundant experience has shown that this method of military education in time of peace furnishes armies in every way ready for war, not only ready but able to carry on war more efficiently than any other soldiers who ever lived.

E. S.

MILITARY TRAINING IN THE SCHOOLS.—See SCHOOL MANAGEMENT.

MILL, JAMES (1773-1831).—The son of a shoemaker, born at Montrose, Scotland, and educated at the University of Edinburgh, where he distinguished himself in Greek and philosophy. Not succeeding as a preacher, he went to London as tutor in the family of Sir John Stuart. This constituted his educational experience, together with the training of his son, John Stuart Mill, an experiment of unusual interest. The education of this precocious child he kept entirely in his own hands and conducted according to his own peculiar ideas. The boy began Greek at three, and at eight had read in the original *Æsop's Fables*, the *Anabasis*, the whole of Herodotus, and six *Dialogues* of Plato, a translation of Plutarch, and the *Histories* of Robertson, Hume, Gibbon, Rollin, Burnet, and Mosheim. He had also begun the study of Latin, Euclid, and Algebra, and was teaching younger children. At ten he had read all the usual classical authors and more. At twelve he was studying Plato and Aristotle, and at thirteen Adam Smith and Ricardo. A detailed account of these studies is given in his *Autobiography* and in Bain's *Biography* of his father. The case was of singular psychological interest. This strenuous method of education produced an intellectual prodigy. Its most effective feature was the intimate association of the child with the vigorous intellect and character of his father and their partnership in scholastic pursuits. But the boy was not the passive victim of a mechanical process of indoctrination. In accordance with his favorite maxim that "one of the grand objects of education must be to generate constant and anxious concern about evidence," the elder Mill encouraged his son to collect and weigh evidence and to accept nothing upon authority. The boy was brought up as a thoroughgoing agnostic, and afterwards described himself as one of the few

persons in England who had not thrown off his religious belief, because he never had any. He always averred that his childhood was not unhappy, although almost entirely lacking in the element of play, and that his tasks were not so severe as to prevent his healthy growth.

James Mill wrote much for the magazines on educational topics in later life, and took an active part in the founding of University College, London. His life in London was devoted chiefly to literary and philosophical pursuits, although he held an important office in the East India Company. His *History of British India* was his greatest literary work, and produced a complete change in the government of that country. Mill played an important part in English politics, and was the originator of what is known as "philosophic radicalism." The Reform Bill was carried through Parliament under his auspices. He was the chief friend and ally of Jeremy Bentham (*q.v.*), to the propagation of whose principles he devoted all his energies. His *Political Economy*, written primarily for the instruction of his son and following the lines of Ricardo, was a highly finished work. His *Analysis of the Human Mind*, which has been regarded almost as the Bible of associationism, won him a high position in psychology and philosophy. Its chief merit lies in its accurate definition of terms and clear statement of results. It simplified association (*q.v.*) by reducing it to a single form—association by continuity, and made great use of "mental chemistry" in fusing ideas and feelings and in showing that morality is based on utility. Thus he furnished a psychological foundation for Bentham's legislative and ethical reforms. W. R.

MILL, JOHN STUART. *Autobiography*. (London, 1873.)

MILL, JOHN STUART (1806–1873).—One of the greatest philosophical writers and thinkers of the nineteenth century; lived his whole life in London. Like Spencer, he had no university training, but was educated entirely by his father, James Mill (*q.v.*) for this interesting educational experiment), in accordance with his own peculiar ideas. This rigorous discipline brought on in his twentieth year mental disorders from which he was rescued with difficulty. After a period of rest and foreign travel, he entered the service of the East India Company, in which he continued for thirty-three years. Much of his time was devoted to philosophical pursuits. In philosophy he was an empiricist, sensationalist, and associationist; in politics, a radical and individualist; in ethics, an utilitarian. He be-

came an author at a very early age. His *System of Logic* is the most original of his works. It was severely criticized by Whewell and others from the scientific point of view, but it became a classic, and ensured him a high reputation in the educational world. His *Principles of Political Economy* followed closely the lines of Ricardo. His *Examination of the Philosophy of Sir William Hamilton* was his chief philosophical work. His *Essays on Religion, Liberty, Utilitarianism*, and the *Subjection of Women* attracted wide attention. His chief contribution to educational literature was his *Address Delivered at his Inauguration as Rector of St. Andrew's University*, which ranks with those of Spencer and Huxley, and exerted a profound influence upon the thought of his day. His thesis was that there is no real antagonism between classical and scientific studies, such as was then supposed to exist, and he raised the question, "Why not both?" He argued strongly for a full and complete education in both directions; but the curriculum which he advocated ruled out modern languages and literature entirely, made extravagant demands for ancient learning, and left little time for scientific training. It was a practical surrender to the classicists. W. R.

MILET, MME — See INFANT SCHOOLS.

MILLIGAN COLLEGE, MILLIGAN, TENN.—A coeducational institution founded in 1882 as the outgrowth of Buffalo Institute. Academic, Bible, collegiate, commercial, and musical departments are maintained. The entrance requirements are fifteen units of work. The college confers the degrees of A.B., B. Lit., B.S., and A.M. on completion of appropriate courses. The enrollment in the collegiate department in 1910–1911 was 134. The faculty consists of eleven members.

MILLINERY. — See HOUSEHOLD ARTS.

MILLS COLLEGE, OAKLAND, CAL.—An institution for the higher education of women, founded in 1871 as Mills Seminary, and the only woman's college on the Pacific slope. A preparatory department was maintained until 1911. The entrance requirements are fifteen units. The degrees of A.B., B.L., and B.S. are conferred in the classical, literary, and scientific courses. The enrollment in 1911–1912 was 121. There is a faculty of thirty-five members.

MILLS, CYRUS TAGGERT (1819-1884). - - Founder of Mills College; was graduated from Williams College in 1844. He studied at the Union Theological Seminary, and engaged in missionary labors in Hawaii. In 1860 he became president of Oahu College, near Honolulu, and from 1864 to 1871 was principal of secondary schools in California. He founded Mills Seminary, now Mills College, in 1871. W. S. M.

MILLSAPS COLLEGE, JACKSON, MISS.

—An institution chartered in 1890 under the control of the Methodist Episcopal Church South, and opened in 1892. A preparatory school, college, and law school are maintained. The entrance requirements are fourteen units. The degrees of A B and B S are conferred by the college. The law school grants the LL.B. after a course of two years without entrance requirements. There was in 1911-1912 an enrollment of 285 students in all departments. The faculty consists of fourteen members.

MILTON, JOHN (1608-1673). - - During the English Civil War, as in other revolutionary periods, new ideas were in the air, not only in regard to politics and religion, but in every sphere of life. The stress of the war drove John Milton, already famous as a poet and a literary genius, to the practice of education as a profession, and, being what he was, also to write on the theory of education. In 1640 he set up house in Aldersgate Street, London, where he entertained a few select and aristocratic private pupils, whom he carried to prodigious lengths of learning. In 1644, at the invitation of Samuel Hartlib (*q.v.*), he published a *Tractate on Education*, and about the same time wrote a little schoolbook, not published till 1669, called *Accedence commenced Grammar*. The latter was written because the authorized Lily's *Grammar* made "two labours of one, by learning first the accedence, then the grammar in Latin, ere the language of those rules be understood" and purported to apply the only remedy, to join both books in one and in the English tongue. It was, in fact, a Latin grammar in English, much simplified, largely by omitting the exceptions to the rules. Though Milton's contemporary, Charles Hoole (*q.v.*), also translated Lily into English, Lily was destined to reign in Latin and produce a hatred for literature in many thousands of English boys for many years to come.

The *Tractate on Education* was also aimed at shortening the road to learning and to prevent "the waste of seven or eight years merely in scraping together so much miserable Latin and Greek, by giving a complete and generous education, which fits a man to perform justly, skillfully, and magnanimously all the offices, both public and private, of peace and war." This was to be done by substituting a knowledge of things for a knowledge of words. But Milton had no idea of

getting at the "things" in English. He would have none of the modern tongue, *Janua* and *Dialectics*, "more than ever I shall read," of Comenius (*q.v.*), then in great vogue. Things must be got at through Latin and Greek. This was sensible enough, as all the authors who wrote on "things," from agriculture in Cato, Varro, and Columella, and architecture in Vitruvius to physiology in Aristotle or *Cynegetica*, the "Book of the Dog," in Oppian were to be found in the two tongues. Grammar, therefore, was the real gate of learning, as it always had been since Latin ceased to be a spoken vernacular. But it was to be learned "out of some easy and delightful book of education," as Plutarch or Quintilian, "with lectures and explanations." In passing through this gate, and having passed it, the pupil was to study everything, — geography, trigonometry, fortification, engineering, navigation; "then out of some not tedious writer, physic, so that they may know how to manage a crudity." Only later were to come comedies and tragedies, followed by politics and laws from Moses and Lycurgus to Justinian and the common and statute law of England. During hours of exercise, which were not to be stinted, fencing, wrestling, music, riding, sailing, were to be learned. Italian was thrown in to be learnt at odd hours, and Hebrew, Syriac, and Chaldean on Sundays. In fact, like Quintilian's Orator or Machiavelli's or Elyot's Prince, every one by the rational system was to become a living cyclopedia.

If it had not been that Edward Phillips, Milton's pupil from the age of ten to seventeen, in his *Life of Milton*, bears witness to Milton's having actually taught the willing youth all these subjects by reading the books and enlarging on them with him, we might have thought Milton was writing a skit on the educational theorists of the day and of previous ages. Milton indeed admits that "this is not a bow for every man to shoot in that counts himself a teacher." The *Tractate* does not perhaps present an impossible program for exceptional private pupils with an "Ulysses" of a master. As a protest against the way Latin and Greek were taught then, and are in many schools still taught, it was perhaps of use. But it was of little use for the ordinary grammar schoolmaster. The theory was impossible of "application to the common herd in a common school by a common man." Milton remained a schoolmaster only for seven years, and his *Tractate* is perhaps only an example of the truth that it is not much use putting Pegasus into harness. A. F. L.

MILTON COLLEGE, MILTON, WIS. —

A coeducational institution established in 1844, and chartered as a college in 1867. An academy, college, and school of music are maintained. The entrance requirements are fifteen units. The college grants the A.B. degree on completion of appropriate courses. The total enrollment in 1911-1912 was 165. The faculty consists of fifteen members.

MIND. -- In philosophy the term is used to designate that form or phase of reality which is contrasted with matter or body. Mind is the reality which thinks, feels, and wills, while matter is the reality which has extension and moves through space. In psychology the term is used, not to designate an entity of some kind, but rather as a general term, to cover all conscious processes, present and potential, in any individual. The essential inner individuality of a person is his mind. In a narrower sense the term is sometimes used to refer more specifically to the knowing processes as distinguished from the emotional and volitional aspects of personality. In this sense mind is sometimes contrasted with soul or spirit. As contrasted with intellect (*q v*), mind is a broader term. As contrasted with spirit (*q v*), it is a narrower term. C. H. J.

MIND, DISEASES OF. — See CIRCULAR INSANITY; DELIRIUM; DELUSION; DEMENTIA; DERANGEMENT; EPILEPSY; FIXED IDEAS; HALLUCINATION; HYSTERIA; ILLUSION; INSANITY; INTOXICATION; INCOHERENCE; MANIA; MEGALOMANIA; MELANCHOLIA; MORAL INSANITY; MORBID; OBSESSION; PARAPHASIA; PSYCHIATRY; PSYCHO-PATHOLOGY; WILL, DISORDERS OF.

MIND READING. — The term refers to the tendency for mental states, particularly when accompanied by emotional value or other intense interest, to reveal their nature through involuntary indications, which in turn may be read by a shrewd observer. It may be well to dismiss the use of the term that implies a transcendent power to read the contents of another's mind by some form of alleged thought transference. (See TELEPATHY.)

The most familiar form of such interpretation is called muscle reading, a term that indicates the part played by involuntary contraction of muscles. Within this field the most familiar demonstration is that of indicating the mere direction of the object thought of or attended to. For this purpose an instrument such as the automatograph is helpful. The instrument consists, in one form, of a board suspended from the ceiling by a thread, and having

inserted below it a bristle, or writing point, which traces its path upon a smoked paper or other suitable surface; in another form it consists of a glass plate carefully leveled, upon which are placed three polished balls, which in turn support a lighter glass plate, to which a recording device is fastened. In either case the hand of the subject rests lightly upon the recording board or plate; and he is directed to give the hand little thought and to absorb his attention in the task set. This may be sensory, as in listening to the beats of a metronome or following with his eyes a series of colors or words as they are successively exposed; or mental, as in tracing an imaginary walk or in thinking intently of a given object in a specified locality. The involuntary tracing thus obtained with a favorable subject will indicate the direction in which the object of attention was situated.

The more complex forms of muscle reading involve a similar revelation not merely of the *direction*, but of the *nature* of the mental content. Yet in the most familiar form of muscle reading the indication consists of the slight tremor or change of breathing or other nervous unsettlement when the point of interest is reached. Thus the muscle reader places the subject's hand upon his own forehead and holds it lightly, and by tentatively trying this or that move, or by pointing to this or that letter or figure on a prepared diagram, shrewdly judges from the delicate changes of tension when he has reached or indicated the object upon which the subject's mind is concentrated. In this way a needle concealed in a distant room, or a number of a bank note, may be found, and yet more delicate "muscle" tasks may be solved. Special studies have also shown the presence of involuntary whispering and other involuntary signals which may provide clues when one individual is trying to read the thought of another. (The shrewdness of dogs or even horses in similarly reading intentional or unintentional signs may also be noted.) Highly susceptible subjects will use the automatograph or the yet simpler form of "planchette," which carries a pencil, and actually writes words indicating the clues to their mental occupation; or reply by "yes" or "no" or other messages to questions, without full awareness of their actions. Such a phenomenon is known as "automatic writing," and involves a considerable departure from the normal state and a susceptible nervous temperament. Related to this are the forms of table moving and rapping, which again are pronounced and partly involuntary indications of the mental intent or content. That these trend toward the abnormal and imply states of high emotional tension is readily realized.

In the most recent methods of mental diagnosis an additional form of mind reading is available. If a subject be sent to another room with two envelopes, each of which contains

directions to perform a set task, but only one of which he is to open, and if upon his return he be subjected to a series of association or similar tests, an examination both of the time period and of the nature of these associations may determine beyond doubt which of the two envelopes he opened and which of the two tasks he performed. The wider and more delicate application of this principle for the discovery of crime has recently excited attention. Throughout, the common principle is the revelation of the mental content by involuntary indications, which in turn are either a form of muscular expression or of an interference with the normal flow of the mental expression. The methods by which we read human expression and the underlying sincerity of candor, or the insincerity or perturbation of embarrassment are similarly conditioned.

MINERALOGY.—The science of minerals. See GEOLOGY; TECHNICAL EDUCATION.

MINING, EDUCATION IN.—See TECHNICAL EDUCATION.

MINISTRY, EDUCATION FOR THE.—See THEOLOGICAL EDUCATION.

MINISTRY OF EDUCATION, MINISTER OF EDUCATION.—The name frequently applied to that department of government which administers educational affairs. Its director or minister of education is usually a party politician, and holds office and is a member of the cabinet as long as his party is in power. Such ministries of education have in most countries been established within the last century, and in some the ministry of education is combined with other functions. The modern tendency, however, owing to the increased importance of education everywhere, is to establish separate bodies.

Germany.—The full development of ministries of education has not yet taken place in the German states. Educational affairs are either administered by the Minister of the Interior, by a Department for Ecclesiastical Affairs, or by a ministry which has charge of both public worship and education. (See GERMANY, EDUCATION IN.) Here only the development of the central administration in Prussia will be dealt with. As long as education was under church control, it was administered and supervised by the church authorities solely. In the middle of the eighteenth century both church and school affairs came within the jurisdiction of the Department of Justice, from which they were separated and placed under the *Oberkonsistorium* in 1750. In 1787 a sepa-

rate department for education (*Oberschulkollegium*) was established under the Minister for Church and School Affairs (then Zedlitz). In 1808 public worship and instruction was placed under a Minister for the Interior, from which in 1817 these functions as well as the charge of medical affairs were withdrawn and a new ministry established in the *Ministerium der geistlichen und Unterrichtsangelegenheiten*, which in the middle of the nineteenth century became the *Ministerium der geistlichen, Unterrichts- und Medizinalangelegenheiten*, or Ministry of Public Worship, Education, and Public Health. The Department of Public Health has been separated off since Jan. 1, 1911. There is a strong movement to establish an independent ministry for education. At the head of the ministry stands the minister, who is responsible to parliament for the management of affairs within his jurisdiction. He is assisted by an undersecretary. The educational section is divided into two departments, each under a director, the one dealing with university, secondary, technical, and art education; the other with the education of girls, physical training, and special institutions for idiots, blind, deaf and dumb. There are employed six sectional directors, thirty councilors, and twenty-three assistants.

England.—The chief executive officer responsible for the national educational administration is the President of the Board of Education, established by the Board of Education Act, 1899. In 1839 a Committee of Council was formed to superintend the application of the first national grant for education. In 1856 the Committee of Council and the Science and Art Department were united in the newly created Education Department under the Lord President of the Council, sitting in the House of Lords, and a new official, the Vice-President, with a seat in the House of Commons. In 1899, as a result of the suggestions of the Bryce Commission, the Board of Education Act was passed, providing for the creation of a Minister of Education, known as President of the Board of Education, responsible for primary, secondary, and technical education in England and Wales. (See ENGLAND, EDUCATION IN.)

The President is assisted by a permanent secretary. The board is divided into two main departments for England and Wales, although certain branches are common to both. The following are the branches into which the work is subdivided: architects, medical, women inspectors, legal, elementary education, secondary school, technological, university and training of teachers, and special inquiries and reports. Scotland and Ireland have separate departments for education, but are represented by the state secretaries for the respective countries.

France.—During the Revolution several experiments were made in establishing a central authority for education. From 1795 to 1808 there was a *Directeur Général de l'Instruction publique* in the *Ministère de l'Intérieur*; this

arrangement was continued under Napoleon, the director bearing the name of Grand-Maitre. In 1815 a *Commission de l'Instruction publique* was established and continued until 1820, when it became the *Conseil royal de l'Instruction*. In 1822 the position of Grand-Maitre was restored, and in 1824 education was placed under the charge of the *Ministère des Affaires ecclésiastiques et de l'Instruction publique*, from which it was separated in 1828, when a Minister of State for Education was appointed (*Ministère de l'Instruction publique*). To this ministry there was added in 1870 the department of fine arts (*Département des Beaux-Arts*). The ministry was reorganized in 1884. There are thirty bureaus under the control of the Minister of Public Instruction, of which seventeen have charge of educational affairs (cabinet of the minister, one bureau; higher education, five bureaus; secondary education, five bureaus; primary education, five bureaus; and accounts, one bureau). Each of the educational bureaus is under a director who is a professional expert.

United States.—Here there is no ministry of education. There is no federal authority over education. A bureau of education under the control of a commissioner of education was established in 1867 in the Department of the Interior. It has several times been proposed to establish a separate department of education under a state secretary, but it seems improbable that this plan will ever be carried out.

For the central authority in other countries see the separate national systems, e.g., AUSTRIA, EDUCATION IN.

MINNESOTA, STATE OF.—First organized as a separate territory in 1849, and admitted to the Union as the thirty-second state in 1858. It is located in the North Central Division, and has a land area of 80,858 square miles. In size it is one third larger than all New England, about one half as large as California, and about the size of England, Wales, and Scotland combined. For administrative purposes the state is divided into eighty-six counties, and these in turn into cities, towns, and school districts. In 1910 Minnesota had a total population of 2,075,708, and a density of population of 25.7 per square mile.

Educational History.—The first school for white children in Minnesota was established at the present site of St. Paul in 1847, two years before the organization of the territory; and when it was first organized in 1849 there were but three settlements in the territory: at St. Paul, St. Anthony, and Stillwater. The first territorial legislature in 1849 enacted the first school law. This provided for the appointment of a Territorial Superintendent of Public Instruction, to be appointed by the Governor

for two-year terms, and at a salary of \$100 per year; constituted each township having five families a school district, with a clerk and three trustees, but permitted the division into school districts if the township had ten or more families; and levied a county school tax of two and one half mills, to which was to be added all money derived from liquor licenses and fines for criminal offenses. The trustees had the power to examine and hire teachers. This law remained almost unchanged until 1860. The first report of the Superintendent of Public Instruction, for the year 1851, reports but eight districts and three schoolhouses in Ramsey County, and four districts and one schoolhouse in Washington County, and an enrollment of but 250 pupils in the state. In 1851 the legislature established the University of Minnesota, though the institution was not opened to students until 1868, the interval being spent largely in erecting a building and in struggling with debts in an effort to save the university's land endowment. In 1853 higher or grammar school classes were organized, and in 1854 a three months' term of school was required. In 1855 the office of Territorial Superintendent of Public Instruction was abolished, and no such official existed again under the territorial form of government.

In 1858 Minnesota was admitted to the Union. The constitution formed at that time made it the duty of the legislature to establish a general and uniform system of public schools; to provide for the sale of the school lands, the safeguarding of the principal, and the distribution of the income from the fund to the townships, on a census basis, provided for general taxation for education, and confirmed the University of Minnesota in its establishment and privileges. This section has remained practically unchanged ever since. An agricultural college was founded, by law, the same year, but in 1868 it was consolidated with the State university. The first state normal school, also, was established in 1858, and opened in 1860 at Winona. In 1868 a second state normal school was opened at Mankato, and in 1869 a third at St. Cloud. In 1860 the city of St. Anthony was authorized to establish a high school; town superintendents of schools were ordered to be appointed to examine and license teachers, and the chancellor of the State university was made *ex officio* State Superintendent of Public Instruction. In 1862 the town of Winona was permitted to effect a separate organization under a board of education; a county examiner, appointed by the county commissioners, superseded the town superintendent; and the Secretary of State became *ex officio* State Superintendent. In 1864 the appointment of a county superintendent of schools was authorized, if the counties so desired; in 1869 the appointment of such an official was required in all established counties; and in 1877 the office was made

elective and required of all counties. In 1867 the Governor was authorized to appoint a Superintendent of Public Instruction, a plan that has been followed ever since. The state first began to care for the blind, deaf, and dumb in 1863, establishing three institutions for such defectives at Faribault; school district bonds were authorized first in 1866; state teachers' institutes were aided first in 1867; and state teachers' certificates were authorized first in 1868. In 1875 an important change was made in the method of distributing the income from the state school fund by providing for a forty-day enrollment basis, instead of a census basis, and this was also made to apply to the distribution of the state one-mill tax for schools, first authorized in 1887. In 1877 the constitution was amended to prohibit aid to sectarian education. In 1878 the state high school law was enacted, the policy of state subsidies for high schools begun, and a State Inspector of high schools appointed. The policy, begun here, has recently been extended to many forms of extra-educational effort. In 1878 women were permitted to vote at school elections. In 1885 state aid for school libraries was granted; a state school for dependent and neglected children established; the Minnesota state reading circle organized, and a compulsory education law enacted requiring twelve weeks' attendance of all children eight to sixteen years of age. In 1899 this law was amended so as to cover the whole time the schools were in session; in 1907 the child labor law was re-enacted and made into a good law; and in 1911 the excuse of poverty for non-attendance was withdrawn. In 1901 the consolidation of schools and the transportation of pupils was authorized; in 1905 county rural school commissioners were authorized to redistrict the counties, and to locate consolidated schools; and in 1909 rural schools were permitted to vote to unite with a central town school for instruction in manual training, domestic science, and agriculture, and to put themselves under the supervision of the superintendent of the central town school. In 1911 state subsidies were granted for consolidation; state aid was granted for the erection of a consolidated school building; and an Assistant Superintendent of Public Instruction was appointed to help forward the consolidation of schools. Efforts were also made in 1911 to secure the creation of a State Board of Education. A constitutional amendment also was submitted in 1911, for the second time, to permit of the imposing of professional standards for the office of county superintendent of schools.

Present School System.—At the head of the present state school system is a State Superintendent of Public Instruction, appointed by the Governor, with the consent of the senate, for two-year terms. He receives a salary of \$3000 and traveling expenses, and appoints a deputy superintendent at \$1800. He has

general oversight of the public schools of the state; meets with the county school superintendents and advises with them; makes provision for the county teachers' institutes, and apportions the State Institute Fund; provides for examinations for teachers' certificates in the different counties at times uniform throughout the state; holds examinations for professional state certificates; may grant permits to teach, and special certificates in certain cases; apportions the state school fund, and grants some of the subsidies for extra educational undertakings; and makes an annual report to the Governor. He is also a member, *ex officio*, of the State High School Board, the State Normal School Board, and the Board of Regents of the state university. The Attorney-General is the official adviser of the State Superintendent, and his opinions have the force of law until overruled by a court.

For each county there is a county superintendent of schools, elected by the people for two-year terms. The salary of the office is fixed by the county commissioners. If there are over 125 teachers in the county, a deputy may be appointed. It is the duty of the superintendent to visit each school in his county at least once each term; to organize and conduct teachers' institutes; to advise teachers and school boards as to the best methods of instruction and as to plans for buildings and ventilation; to keep all records, and file all official papers; to call a meeting each year of the district school officers, for the purpose of instruction on their work and duties; to hold examinations for teachers on dates designated by the State Superintendent, and to revoke the certificates issued for cause; and to make an annual report to the State Superintendent.

The organized territory within each county is divided into common, independent, and special school districts. These may be consolidated or divided, by petition and election. For unorganized territory, a county board of education, consisting of the chairman of the board of county commissioners, the county superintendent of schools, and the county treasurer, looks after the educational needs of the children, and levies a tax to provide instruction for them. The county commissioners may, on petition of 25 per cent of the residents must, appoint a rural school commission of seven, one of whom is the county superintendent, to redistrict the county and form consolidated districts and farm schools. The plan and map are published and submitted to a vote of the people for approval. The annual school meeting is held in July; special meetings may be called; and women may vote at such and hold school offices. Such meetings may elect officers; select sites; build and move buildings; vote money for maintenance; and provide free textbooks. On request of five persons, the question of free textbooks must be voted on. About 90 per cent of the districts

provide free textbooks, the remainder selling them to the pupils at cost. Common school districts have a chairman, treasurer, and clerk, elected as such, and independent districts have a board of six directors, who may employ a superintendent of schools. The boards of both forms of districts have power to purchase and sell equipment; lease classrooms; employ and dismiss teachers; provide free textbooks, or sell them at cost to pupils, prescribe rules and regulations for the schools; determine the textbooks and courses of study; admit nonresident pupils; establish and discontinue such grades of schools as are thought best; provide transportation for pupils living more than half a mile from school; contract with adjoining districts for the instruction of pupils; and independent districts may establish kindergartens and evening schools. In common school districts the board submits an estimate of financial needs to the annual meeting for approval, but in independent districts the board determines and levies the tax. Clerks and treasurers may be paid a small sum for their services, and members are paid a *per diem* and mileage to attend the annual county school board convention, called by the county superintendent. The exclusion or segregation of pupils on account of race, color, social position, or nationality is forbidden. All public schools must be free, and taught in the English language, though one hour per day in foreign languages is allowed. The schools are divided into the following grades, or groups:—

- (1) High schools: nine months' term; teachers, course, and equipment approved.
- (2) Graded schools: nine months' term, four teachers; principal must be a normal school graduate, or must hold a state professional license.
- (3) Semi-graded schools: eight months' term, two teachers; principal must hold a first or second-grade certificate.
- (4) Consolidated rural schools —
 - (A) eighteen or more sections of land; eight months' term, four rooms, principal able to teach agriculture.
 - (B) eighteen or more sections; eight months' term; three rooms, principal same.
 - (C) twelve to eighteen sections, eight months' term; two rooms; principal same.
- (5) Common schools. —
 - (A) eight months' term; teacher first-grade certificate.
 - (B) eight months' term; teacher second-grade certificate.
 - (C) seven months' term; teacher second-grade certificate.
 - (D) shorter schools and lower grade certificate.

School Support.—The state originally received 2,969,990 acres of land in the sixteenth and thirty-sixth section grants, about two thirds of which have been sold. The permanent state school fund is now about \$20,000,000, and is increasing nearly one million dollars a year from sales of land and timber, mineral leases, and iron royalties. The state one-mill tax for schools produces over \$6,000,000, making a total state fund of about \$8,000,000 for

apportionment. This is about 20 per cent of the cost of the school system. The income on this fund, together with the state one-mill tax, produces a fund of over \$2,000,000 a year, which is apportioned to the counties and districts on the basis of a forty days' enrollment in the schools. The amount received in each county from fines, strays, and liquor licenses is added to the fund, before apportioned to the districts. This fund can be used only for teachers' wages, and all districts must raise an equal amount by local taxation. The local taxation consists of a one-mill county tax, but given back to the districts paying it, and local district taxes in addition, as voted. These latter may reach fifteen mills for maintenance, and ten mills for buildings in common districts; up to eight mills for buildings in independent districts, up to nine mills for all purposes in districts of 20,000 to 50,000; and up to eight mills for all purposes in districts of over 50,000.

In addition to the regular state fund and tax Minnesota has gone further perhaps than any other state in the matter of special grants and subsidies for special and desirable educational efforts. A list of these grants, as they were made for the biennium of 1911 and 1912, will show their nature and extent:—

SCHOOL	GRANTS	APPROPRIATIONS, 1911 AND 1912
Regular High Schools . . .	\$1750	\$320,700
Two-year High Schools . .	\$200	
Normal Training Course in .	\$750	
Agricultural High Schools ¹ Up to	\$2500	210,000
Graded Schools . . .	\$600	133,600
Semi-graded Schools . . .	\$300	160,558
Industrial Courses in high or graded schools ²	\$1000	125,000
Rural Schools ² uniting for Maintenance	\$200	
Consolidated Rural Schools ² —	\$750, \$1000 or \$1500	100,000
Consolidated Rural Schools ² — New buildings	Up to \$1500	
Rural Schools abandoned and pupils transported ²	\$150	910,617
Grants to Common Schools	\$50, \$100, \$150	
Schools in unorganized territory		100,000
Public School Libraries	\$10, \$20	35,000
Public Schools on Indian Reservations		15,000
Five cents an acre for state land in districts	Up to \$250	50,000
Webster's Dictionaries for schools	\$7	4,800
Teachers' Institutes in the counties		27,000
Total Specific Grants for Biennium		\$2,192,675

¹ Added in 1909

² Added in 1911

The total cost of the public school system for maintenance only was about \$10,000,000 in 1910.

Educational Conditions.—Educational conditions in Minnesota are very good, for a state so sparsely settled. The state is richly agricultural, with a thrifty agricultural people.

59 per cent of the total population live in country districts, and 25 per cent in the two cities of St. Paul and Minneapolis. In the whole state are only 165 cities and towns with schools of four or more teachers, while among the rural schools of the state 258 enrolled less than 10 pupils, and 1860 less than twenty. 53 per cent of the total population is male, less than one third of 1 per cent are of the colored race, and 73 per cent are native born. The illiteracy is low, being about 4 per cent in 1910. The foreign born are largely Norwegians, Swedes, English and Canadians, and Germans. Marked educational progress has been made during the past decade, particularly along the lines of lengthening the term, eliminating the untrained and weak teacher, the consolidation of schools, and the introduction of agricultural and industrial instruction. The state has good schoolhouses; 85 per cent of the districts have school libraries; and the schools have good equipment. A State Library Board, consisting of the State Superintendent and the presidents of the five state normal schools, publishes lists of books, arranges contract prices, and apportions state aid to the districts of \$20 the first year, and \$10 thereafter, provided the district raises at least as much. About 100,000 volumes are added to the libraries each year. The inspection carried on by the different state inspectors has had a marked influence for good on the schools. The state has a good compulsory education law, children from eight to eighteen being required to go to school all the time the schools are in session, unless excused for certain specific reasons. In 1911 the excuse of poverty was withdrawn. Any board may appoint a truant officer, maintain a truant school for pupils from eight to sixteen, and may secure commitment of incorrigibles to the state training school. No child under fourteen can be employed in any factory, and not at all during school time. Children over fourteen must have labor certificates. The state labor department is charged with the enforcement of the child labor laws. Since 1909 all deaf and dumb, eight to twenty, must attend the state school, unless provided for in cities or excused for certain statutory reasons. The school term in all the larger schools is from eight to ten months, and averages seven and a quarter months for the state as a whole.

Teachers and Training.—The state employed 15,157 teachers in 1911. Of these 12 per cent were men, 45 per cent were high school graduates, 26 per cent were normal school graduates, and 9 per cent were college graduates. The state aid for schools employing teachers with first or second-grade certificates has done much to eliminate the third-grade certificate, only about 7 per cent of the teachers holding such. In addition to the five large state normal schools at Winona, Mankato, St. Cloud, Duluth, and Moorhead, many high

schools offer one year of professional training, following three years of high school work, and the graduates of such a course receive a one-year second-grade certificate. The State Superintendent issues first-grade professional certificates to permanent teachers, on examination or credentials, and second-grade professional certificates on examination. County superintendents issue first and second-grade certificates on examinations or credentials, and third-grade certificates on examination, only when necessary, and these are limited to particular districts and valid for but one year. The examination subjects are graded, and form a continuous series, each examination involving new subjects and broader preparation. Graduates of the state university, who have taken the pedagogical course, and graduates of the normal schools, are granted first-grade certificates. Cities of over 50,000 inhabitants (Minneapolis, St. Paul) may examine their own teachers. Two examinations are held each year; all expenses for such are paid by the state or county, and no fees are charged teachers admitted to them. A teachers' institute of four days is required in each county each year. Summer sessions of four to six weeks are held in each of the state normal schools.

Secondary Education.—Secondary education in the state is well organized, and the number of high schools in the state is increasing very rapidly. In 1895 there were 86; 1900, 115; 1905, 174; and in 1910, 210, with over 21,000 pupils enrolled. There is a State High School Board, composed of the State Superintendent, the president of the state university, the president of the board of normal school directors, *ex officio*; the principal of one high school; and one other, appointed by the Governor. This board looks after the high schools and the graded schools of the state, and has power to prescribe rules and regulations for courses of study, examinations, and conditions for receiving state aid. To represent them, and to act as their agent, they appoint a high school inspector to visit the high schools and a graded school inspector to visit the graded schools each year, and they may ask county superintendents to visit and report to them. The provision for aid and inspection for graded schools (nine months; four departments) is a meritorious feature of the Minnesota state school system. The agricultural high schools, ten of which were authorized in 1909, are another meritorious feature. In 1911 the number authorized was increased to thirty. In 1911 state aid to two-year high schools, and to high schools offering instruction in agriculture and either manual training or home economics, was also authorized.

Higher and Special Education.—The University of Minnesota (*q.v.*), at Minneapolis, a large, important, and rapidly growing institution, opened in 1868, is the culmination of the public school system of the state. The state

also maintains, under the direction and control of the University Regents, state schools of agriculture at Crookstown and Morris, a sub-agricultural station at Grand Rapids, and an agricultural high school at the university. (See AGRICULTURAL HIGH SCHOOLS.) In addition to these institutions, the following colleges offer higher instruction:—

INSTITUTION	LOCATION	Op'd	CONTROL	For
Hamline University	St Paul	1854	M E	Both sexes
St John's University	Collegeville	1857	R C	Men
Gustavus Adolphus College	St Peter	1862	Luth.	Both sexes
Carlton College	Northfield	1867	Nonsect.	Both sexes
Augsburg Seminary	Northfield	1869	Luth.	Men
St Olaf College	Northfield	1871	Luth.	Both sexes
Albert Lea College	Albert Lea	1884	Presby.	Women
Macalester	St Paul	1885	Presby	Both sexes
Parker	Winnebago	1888	Free Bap	Both sexes

The state also maintains a number of institutions for the training of defectives. These are: the State Training School for Boys and Girls (reformatory), at Red Wing; the State Reformatory at St. Cloud; the Minnesota School for the Blind, at Faribault; the Minnesota School for the Deaf, at Faribault; and the Minnesota School for Feeble-Minded and Colony for Epileptics, at Faribault. E. P. C.

MINNESOTA, UNIVERSITY OF. MINNEAPOLIS AND ST. PAUL, MINN.—A coeducational institution established in 1851. A preparatory school was conducted until the financial panic of 1857. After a period of difficulties, a reorganization was effected in 1868, and collegiate instruction was begun in 1869 under President Folwell. The university was given lands for the support of a college of agriculture, and was empowered to organize other colleges and schools. President Folwell fostered practical agricultural education, organized the geological and natural history survey (1872) in organic connection with the university, and secured the establishment in 1878 of high schools receiving state aid in consideration of their preparing students for the university. The university thus became actually as well as nominally the head of the state system of education. Under the administration of President Cyrus Northrop (1884-1911) the following colleges and schools were organized: engineering and mechanic

arts in 1885, medicine and surgery, homeopathic medicine (discontinued in 1909), dentistry and law in 1888, mines in 1889, pharmacy in 1892, analytical and applied chemistry in 1903, graduate school and college of education in 1905, forestry and training school for nurses in 1909. The work in agriculture has developed until it includes a college, school, short courses for farmers and teachers, an experiment station at the university, and three schools of agriculture and two experiment stations at other points in the state. The college of forestry has extensive forest lands near Lake Itasca for practical work. In 1911 Dr. George Edgar Vincent succeeded Dr. Northrop as president of the university.

Prior to 1884 more than \$300,000 had been invested in farms, campus, buildings, and equipment. By the year 1906 this had increased to nearly \$2,000,000, and by 1911 to about \$6,000,000. The university has received from private benefactions about \$550,000. Since 1907 the campus has been increased from about 53 acres to about 120 acres at an expense of \$841,000, and the sums made available by legislative appropriation for the years 1908 to 1913 for the purpose of new buildings, equipment, and other permanent improvements amount to over \$4,000,000. The university is supported by funds received from the federal government, by legislative appropriations and the proceeds of a .23 mill tax from the state, by interest on invested proceeds of land sales, and by students' fees. The annual budget for current expenses for the year 1911-1912 shows a total income of \$1,410,000. The university still retains a large part of the lands granted for its support, and much of this land contains valuable ore deposits. The endowment ultimately to be derived from these ore lands can scarcely be estimated at present—certainly several millions of dollars. The university occupies twenty-five buildings on the university campus, twenty-nine buildings at the university farm, and thirty-three buildings at the other agricultural schools and experiment stations. There are under construction six buildings on the university campus and ten buildings at the college and schools of agriculture.

There is required for admission to the colleges of science, literature and arts, agriculture, engineering, dentistry, mines, pharmacy, chemistry, forestry, and nurses' training school, a four years' high school course (fifteen units), including certain specified subjects. The colleges of medicine, law, and education require two years of college work for entrance.

The length of the courses of study in the several colleges is as follows: education, two years; dentistry, law, and nurses' training school, three years; science, literature and arts, agriculture, chemistry, forestry, mines, and pharmacy, four years; medicine and engineering, five years. The college of medicine requires

one year of satisfactory service as hospital interne before granting the M.D. degree. The usual degrees for undergraduate and graduate work are conferred by the university.

The enrollment of students of collegiate grade in 1911-1912 was 4073, of whom 311 were in the summer school. Students in agricultural schools, 1322, of whom 186 were at Crookston and Morris. Correspondence and extension courses, 306. Total enrollment, 5701. The faculties at Minneapolis and St. Paul consist of 418 professors and instructors and 104 assistants, at Crookston and Morris, 22 instructors; total, 544 members. J. B. J.

MINSHEU, JOHN.—A teacher of languages and writer of a polyglot dictionary in 1617. He edited and enlarged R. Percyvall's *Dictionary* in Spanish and English in 1599 (and 1623), and augmented Percyvall's Spanish Grammar in 1599. His polyglot dictionary is entitled 'Ἑρμῶν εἰς τὰς Ἰσῶρας, id est, *Ductor in Linguas. The Guide into Tongues*. Originally there were eleven languages: English, Welsh, Low Dutch, High Dutch, French, Italian, Spanish, Portuguese, Latin, Greek, Hebrew. These are given together for the sake of comparison. In his address to the reader he enumerated the various gentlemen who had assisted him in undertaking his great work, and prefixed to the *Dictionary* a catalogue of subscribers for the volume, headed by the King (James I), the Queen, and the Prince—the first instance of a book containing such a list. Published in the year following Shakespeare's death, it is of special value as containing the most representative names of book-buyers in England. F. W.

MIQUELON.—See FRENCH COLONIES, EDUCATION IN

MIRABEAU, GABRIEL HONORÉ RIQUETI, COMTE DE (1749-1790).—French author, orator, and statesman. His chief interest in the field of education is indicated by four speeches published posthumously by his friend Cabanis under the title: *Travail sur l'Éducation publique trouvé dans les Papiers de Mirabeau l'aîné* (Paris, 1791). In one of these he advocated the abolition of the three French academies (later done by the Convention, 1793), to be replaced by a single national academy. A rather elaborately worked out plan of educational organization recognized the following as essential factors in the scheme: (1) academies (i.e. learned societies); (2) colleges and public schools; (3) medical schools; (4) the theater; (5) museums, botanical gardens, and public libraries. This never got beyond the stage of a "proposed" bill, but it merits note among the educational activities of

the revolutionary period. His works were published in nine volumes (*Œuvres*, Paris, 1825-1827). F. E. F.

MIRROR WRITING.—Writing which would appear like normal writing if seen in a mirror. Such writing as this very frequently appears in abnormal cases. It is readily produced by a normal individual by taking a pencil in his left hand, and moving this hand freely without special effort to control the direction of its movements while he writes with the right hand. Certain persons when hypnotized produce mirror writing with the right hand. The whole matter is of importance to the teacher because certain children exhibit a tendency to produce mirror writing in the early years of their training. Such a tendency of the young child may be due to the fact that a child is extremely left-handed. When he is forced to write with his right hand, he sometimes inverts the order of the movements as a normal individual inverts these movements in the experiment of tracing with his left hand. The teacher will very frequently regard a child as utterly incompetent to form letters because the regular form of the movements is overlooked on account of their inverted character; where such cases arise, it is usually best to make some concession to the left-handed character of the child's organization. C. H. J.

See AMBIDEXTERITY; WRITING.

MISSIONS, THE EDUCATIONAL ASPECT OF MODERN.—Modern missions began with the last century. The charters of the missionary societies organized at that time and for fifty years afterward contained little or no allusion to educational work. The purpose of the missionary endeavor was set forth in the general statement, "to preach the Gospel to the heathen nations." An occasional charter refers to the translation of the Scriptures into the languages of the East as indicating a part of the work the missionary society was set to accomplish, but in none of these earlier charters was there revealed any purpose to plant systems of education in the East. It is equally apparent that when the earlier missionaries reached their widely separate fields they quickly saw the necessity of beginning some kind of educational operations, and schools of low grade were among the first reported results of missionary labor. The fact that this method of approach was adopted by practically all of the earlier missionaries indicates a general practical need for educational

work as a foundation for the missionary enterprise. As in most instances the early schools established by the missionaries were the only educational institutions in the country, they were naturally of the most primitive grade. In reporting the schools thus started, emphasis was laid by the missionaries, not upon their educational value, but upon the approach to the people that the schools afforded, and also upon the fact that through these schools natives were being trained to become missionaries' helpers.

It is not within the province of this article to record the development of the mission school, but it should be recognized that as a natural and inevitable result the grade of mission schools was lifted until there were developed special forms of education, as ministerial training for selected young men and a more general line of education with emphasis upon languages, history, geography, and mathematics, for the preparation of teachers. It was inevitable, however, that the school should experience a larger degree of development, especially in countries like India and Turkey, where there was a strong desire on the part of the people for a higher education for their children.

Another stimulus to the development of the educational work of missions was the fact that so many of the missionaries had received college education and were naturally appreciative of the value of such a discipline in the new society which they were endeavoring to establish throughout the mission fields. These saw the necessity of thoroughly educated men and women to hold positions of leadership, not only in what are called the learned professions, but in all departments of business. At the same time the mission plan involved the development of the Christian Church as an institution developed within the East, with Eastern funds and under Eastern leadership, itself aggressively extending Christianity in the country in which it was established. It required no argument for these men and women, themselves the product of the highest education given in England and America, to realize that such an Eastern Church must have as its leaders men and women of the broadest intellectual training. This fact was emphasized when attention was called to the defective educational systems already existing in China, India, Japan, and other countries, which, although inadequate to prepare men for modern life, nevertheless possessed great disciplinary values. It was evident that if the Church of Christ, which the missionaries were attempting to develop throughout the East, was ever to become a recognized force and assume a place of leadership, it must be through the wide dissemination, among the Christians at least, of general education, including even that of collegiate grade and rank.

Another important factor in the development of missionary education, particularly

that carried on by missionaries from England and America, was the introduction of the study of English. In most of these countries at the beginning of the last century there was no educational literature, and it could hardly be expected that the missionaries would ever be able to produce a modern scientific literature in the vernaculars of the various countries where they were carrying on work sufficient to meet the demands of the higher educational institutions into which their intermediate and boarding and high schools were bound to develop. They did create a literature for the primary and intermediate schools which was measurably adequate, but the task of doing the same for the colleges was practically too great to be undertaken.

At the same time, as the earlier missionaries represented for the most part the English speaking world, and as the countries from which they came were recognized by the people as of leading political and commercial influence, it was but natural that there would be a general desire on the part of the young men, at least in mission collegiate institutions, and even in high schools, to study English. In India a knowledge of the English language opened a career under the East India Company, and later under the British government, for any Indian young man; the same was true of Burma and Ceylon. Moreover, in other countries, not officially connected with English-speaking nations, there was soon developed the opinion that English was a modern classical language, the language of the great commercial nations of the world, and that the mastery of that tongue would be of financial as well as intellectual value to their young men.

From 1855 to 1875 there was a reaction on the part of some missionary societies against higher educational work in mission institutions, and especially against the teaching of the natives through the medium of Western languages. This department of mission effort had not made the same progress in German and Scandinavian societies that had been made by English-speaking societies. There was at that time much discussion among the home societies and their constituency as to the place of higher education in missionary work. While in not a few instances the decision in the councils of the home societies was against the further development of higher educational work on the mission field, under the direction of the missionaries this work was gradually and persistently enlarged, until during the last quarter of that century, mission boarding and high schools in no small number began to assume the rank and do the work of collegiate institutions. It should be stated that in the meantime the conservative constituency at home began to realize the place that education must take in the planting of permanent Christian institutions in the East, and opposition rapidly diminished until it has now practically disappeared.

Among the Roman Catholics quite another set of problems presented themselves. Their schools were not as democratic and general as those of the Protestants, but were regarded more as church schools, and were maintained within and for the Church.

The Aim of Mission Schools.—In creating a system of education in the mission field the endeavor has been made from the beginning so to develop the work that it shall belong to the country and not have the appearance of being a foreign educational system imposed upon the country. The teachers in most primary schools, apart from the heads of kindergartens, are natives. The same is practically true in the boarding and high schools, except that occasionally the head of the school, for the present at least, is a missionary. It is not expected, however, that the foreigner will hold permanent control.

In collegiate institutions the great majority of the teachers are natives of the country. In some of these the president is a native, with missionaries working under him, as in the Doshisha in Japan. Even in the theological schools in mission fields, native teachers are employed. It is probably true that the foreigner will keep his hand upon the collegiate and theological institutions longer by far than upon the other schools of the country; how long he will continue to hold dominating influence will depend upon the rapidity with which the country itself develops in moral and educational ability and the native leaders show themselves capable of assuming the larger Christian responsibility. The general policy, however, of mission institutions in this respect has been from the first, and still is, to develop native talent as rapidly as possible and to employ that talent in the educational work.

Support of Mission Schools.—Another phase of this work is the development of self-support. It was early learned by the missionaries that free schools were practically valueless. The Asiatic appreciates that for which he pays something, but is liable to look almost with disdain upon that which costs him nothing. No free school can expect to command the regular attendance of its pupils. There are probably no schools in the world that come nearer to self-support through the tuition paid by pupils than do many of the mission schools of the East. In fact, large numbers of these schools are wholly self-supporting, although still retaining their relations to the mission. Even the collegiate institutions, in some countries like Turkey, secure from the pupils themselves in the form of fees or tuition from three-fourths to five sixths, or even a larger ratio of the cost of the conduct of the schools. The development of self-support has not been so marked in India because of the greater poverty of the class of people who make up the student clientèle. So long as Americans and Europeans remain in any appreciable num-

ber as teachers in the mission colleges and universities, financial help from abroad will be necessary for their conduct.

The Character of Mission Schools.—Missionary education has been handicapped for the lack of a model or precedent; the whole plan of education had to be wrought out by the missionaries through long and protracted experiments in each country. Each different country presented new problems to be met and solved. At the same time few of the missionaries had received scientific pedagogical training. Large numbers had full collegiate training, but with no special reference to the teaching profession. Many missionaries went to the field expecting to engage only in evangelistic enterprises, but soon found themselves in charge of a large educational work.

It is no wonder then that the development of the missionary educational system, if it could be called a system, was irregular and often unscientific. The hindrances already named were enhanced by the fact that the man who was at the head of a high school, college, or even university was seldom able to give his entire time and strength to that work. Recognizing also that missionary educational efforts from the beginning have been curtailed for the want of proper financial support, we begin to realize some of the limitations under which this work has been developed. There is hardly a mission school to-day that is properly equipped. In the marked educational advance of countries like Japan the missionary schools are rapidly left behind. The Eastern governments, becoming alert to the value of modern education, are able to appropriate funds for the erection of buildings and for their equipment, far superior to those of any mission plant. China is making rapid progress in this line at the present time, and even the Turkish Empire, under the new régime, is appropriating large sums of money for developing a national educational system.

Notwithstanding that missionary work is so defective in equipment and in skilled leadership, the fact remains that the mission schools in most of these countries have been the models which have demonstrated to the officials of the country what can be done in the line of modern education, while, at the same time, they have awakened ambition in the hearts of the people for education. Moreover, though far surpassing the missionary institutions in equipment, in many places the government schools are not popular, because of inability to secure teachers able to command the confidence of the parents and pupils.

Courses of Instruction.—It is impossible within the limits of this article to give any adequate conception of the courses of study offered in the higher collegiate missionary institutions. In each case and in every country the missionary college offers a curriculum that places it among the first educational institu-

tions of the land. This position is held by nearly all of the so-called mission colleges, although at present in Japan the national universities are in advance of the missionary college, and it is expected that the students of the missionary college, to complete their course, will go to the university. In each country the endeavor is made to adapt the course of instruction to the needs of the country. In no instance has the American or English curriculum been transported bodily to the East. Less emphasis is laid upon the dead languages, and more emphasis upon spoken tongues, especially English, French, and German.

The sciences, which were at first indifferently taught, are receiving more emphasis as the East is developing. Special stress is laid upon the history of Western nations, upon the science of government, economics, etc., all of which are demanded. At the present time there is an unusual demand for the sciences and the development of technical training. How far missionary societies will be able to respond to this call remains to be seen. To meet this demand the universities' missions are coming to the front.

It should also be understood that all of the mission colleges put emphasis upon the training of the stable moral character. This statement applies to all of the mission schools, beginning with the kindergarten and primary school. The development of character is fundamental in the ideas of the missionaries and the societies backing them, and emphasis upon this point is not lacking even in institutions not especially labeled as missionary, but which have grown out of the missionary educational system.

The Protestant mission schools, with few exceptions, have no religious tests for admission or for graduation. In most of the schools the fundamental truths of Christianity and the principles that underlie it, as well as something of an outline of the history of its development and the growth of the Christian Church, have place in the regular instruction given. Every pupil is left free to adhere to the religion of his fathers, without loss of standing in the school and without sacrifice of any of its privileges.

Female Education.—There is probably no department of missionary education which is more fundamentally important than that dealing with the education of girls. In nearly every country where the missionaries have started schools there was not only an immemorial custom, but a deep-seated and fundamental prejudice against the advance of woman, and in most of these countries it was a matter of belief that women were incapable of intellectual improvement. In some places the idea that a woman could learn to read was hardly to be entertained; but the still more advanced idea that she should be educated was regarded as preposterous.

In the face of this handicap, the missionaries began in a modest way to educate girls, in the face often of open and violent opposition. It has been a matter of surprise to the missionaries themselves that this opposition has so completely disappeared. Girls' schools in many of the mission fields are among the most popular of missionary institutions, and many an Oriental parent is paying handsomely for the education of his daughters. While Japan has made marvelous progress in adopting an educational system for the empire, she has not made the same development in girls' schools as in those for young men; and even to-day it has been stated on what seems to be good authority that the mission collegiate institutions for young women are superior to the government institutions for girls.

The girls' schools, at first of the humblest character, have developed, as have the schools for boys, and have proven to the people beyond any possibility of doubt, not only that girls are capable of intellectual discipline and development, but that there is a place in Oriental society for the educated woman. These school systems have developed into colleges for young women, some of which have already gained international repute, like the American College for Girls in Constantinople, and other institutions in Turkey of similar character, as well as colleges for girls in India, China, and Japan. While the courses of study in these colleges are not yet quite up to the grade of corresponding institutions for men, yet they do not lag far behind. They are all thoroughly abreast of local conditions, and are preparing women for positions of marked influence and leadership. The graduates of these schools have open to them the teaching profession, and the demand even from government institutions for teachers is far greater than the mission schools can supply.

As a natural result of the elevation of womanhood through these schools of the East, we find that the young men who are graduates from higher institutions of learning are eager to secure wives who have had a higher course of instruction. About one third of all the pupils in the mission schools of the world are girls and young women. This fact demonstrates the place which these schools already hold and the influence they exert.

Classification of Schools.—Departmental classifications of mission schools have been most unscientific in all countries, and without uniformity throughout the world. The fact that every missionary society prosecuting work for any length of time in a single country has felt it necessary to take up some form of educational work is a clear indication that, in the judgment at least of the workers on the ground and the societies at home, permanent missionary institutions cannot be established in any country without their being embodied in some form of general education.

The first educational work undertaken by the missionaries was elementary.

Primary or Village Schools. — Even during the first modern missionary generation the primary school held an important place. The first work the missionaries could do, even while they were learning the language of the people, and, in fact, as one of the most effective ways of securing a working knowledge of the vernacular, was to gather groups of children together into rude schools. If there was a literature of the land, the children were taught to read that literature; if, as in the case of many of the peoples of Africa and the islands of the Pacific, their own vernacular had no written character, the children were taught the characters which the missionaries created and the grammar of the language which they made, and thus education in the vernacular commenced.

The village or primary school, however, has become one of the institutions of missionary effort, and lies at the foundation of the educational work carried on in all countries. In these schools are gathered by far the largest number of the pupils under missionary instruction. Most of these lowest schools are not carefully and thoroughly organized. In no single country can the missionary primary educational work be called a "system," as there is little or no relation between the schools carried on by one mission board and the schools even in near regions carried on by another missionary organization. While there is lack of systematic cooperation in primary educational work, essentially the same things are taught in all these schools, *viz.* training in writing and reading the vernacular, with a smattering of number work and a little geography and history, with stories about foreign countries and the Bible. In some countries, and by some mission boards, English, German, or French is taught even in the lower grades.

It can be laid down as a fact that wherever the modern missionary has gone and among whatever people he labors, there have been organized under his direction widely extended common village schools for both boys and girls. These, for the most part, were at the beginning and still are the only schools of the kind in the country, and furnish the only rudimentary education afforded the children of that country. The teachers in these schools are natives, who in turn have received their training in the higher schools more directly under the missionary. The missionary has general charge of the primary educational system, and, in many cases, the expense of the school is paid in whole or in part by the people themselves in the form of tuition. This statement does not apply to Japan and some other countries, since the governments of Japan and a few other nations have themselves developed a comprehensive primary educational system which has made it unnecessary for the missionary to give

time and strength and to spend money on this line of work.

The primary and village schools now carried on by Protestant missionaries alone number nearly 29,000, and they have an attendance of over 730,000 pupils, of whom nearly one third are girls. In each instance it is in these schools that children receive the first rudiments of an education and get their first ambition to advance in an intellectual course. The most of these schools are in rural regions, away from centers of influence and action, but among some of the most virile populations.

The Roman Catholics were in some respects the pioneers in the prosecution of primary education. In schools organized and conducted by them among non-Christian races they have a primary school population under their direction and control numbering 841,000. This gives a total of children in non-Christian countries studying in Christian mission schools in the primary grade of 1,571,000, but few of whom would have had any school privileges had it not been for the missionary.

Kindergartens. — The kindergarten was introduced into Asia by missionaries. It is a comparatively new method of education in the Nearer and the Farther East. Missionaries introduced the first kindergarten into Japan and prepared the first kindergarten literature, but the Japanese government has now adopted this method of training. It is proving to be one of the most popular methods of education that the missionaries have introduced into any country, attractive to parents and receiving general favor from government officials. In India the government gives subsidies for well conducted kindergartens. The Chinese are showing unusual interest in kindergarten training; and in Turkey parents are eager to have their children come into the developing and suggestive atmosphere of the kindergarten. The kindergarten holds a different place in missionary education from that occupied by the common village school. In the latter, for the most part, pupils are gathered from the lower strata of society, while the kindergarten has the patronage of the higher classes and thus brings the missionary educational system closer to the palace. The kindergarten has not yet been widely introduced in any country abroad. Only the more advanced of the Eastern peoples have yet been offered this method of child instruction. There are as yet only about 5000 children in the Protestant missionary kindergartens, while the Roman Catholics seem to have given little or no attention to this type of education.

Intermediate and High Schools. — During the first missionary century in this modern era, practically all of the education carried on by missionaries was of the primary character. It was inevitable, however, that in the awakening of the East, education could not be kept down to primary grade, and that steady advance

should be made until the primary and village school grew into the intermediate school, which, in turn, developed into the high school. This statement should not give the impression that the missionaries had a well developed school system, in which pupils passed readily and systematically from one grade to another. It is not uncommon even to-day to find under a single roof, occupying the same classroom, and studying side by side, students of primary and of high school grade, with all gradations between.

At the same time it should be recognized that the desire for education on the part of the people themselves, coöperating with the need of the missionaries for trained native workers, led to the development of the educational system at the larger centers of population until there came to be well-defined schools, which, in the ordinary classification, would be called high schools. These did not fit for college or have a uniform course of study, but they were the schools giving the highest and most extensive training to both young men and young women in the country, and would compare favorably with even some collegiate institutions in the United States, two hundred and fifty years ago. In the Protestant mission schools in Africa and the East, of intermediate and high school grade, including mission boarding schools referred to under another heading, there are now studying 165,500, of whom about 60,000 are girls and young women, while the Roman Catholics have an attendance in schools of a similar class of 156,000. This makes a total of students studying in mission intermediate, boarding, and high schools for both sexes and in all countries of 321,000.

Boarding Schools.—The missionary boarding school might almost be classed under the name of high school, but having characteristics peculiar to itself, it fills a place of such great importance in the work of missionary education among Eastern races that it should receive special mention. The missionary boarding school is probably the poorest classified and organized school which can be named. Under modern development it has become much better organized than a few years ago, but the basis of classification in the boarding school is the pupil, and not his studies or age. In most of these schools pupils are gathered from outlying districts and kept in the school home, which may well be compared to the old New England academy. The emphasis, from the missionary standpoint, is placed upon the Christian character of the home into which the pupils are gathered, and not upon the courses of study or the scientific character of the instruction given. It is from these schools both for boys and girls that the missionary secures teachers for the lower schools and the best native missionary workers. Statistics were given under the preceding subject.

Normal Schools.—The normal school is one

of the later developments of the missionary educational system. It is only in recent years that the missionaries have been conscious of the necessity of having more scientifically trained teachers. Even at the present time, however, the missionary normal schools are woefully deficient. Few indeed have come up to grade, but it should be said that an earnest endeavor is now being made to put normal instruction upon a better basis. In some countries the missionaries of various denominations are uniting in the development of a normal school that is worthy of the work to be done. Missionaries are securing for themselves special pedagogical training, with a view to giving more attention to normal school education. This advance has been made under the stress of the need and the pressure of the governments where the schools are. India, for instance, is demanding a better grade of teachers for the primary schools that receive grants-in-aid from the government. The same is true of Ceylon, and it will undoubtedly be true soon of China and of Turkey.

It is strange that the normal school has not had earlier and more complete development. It is expected that this phase of missionary work will henceforth develop more rapidly, and that the missionary schools will be called upon much more than in the past to provide teachers for the governments, and that they will be copied more as models for the development of national institutions. It is impossible to secure accurate statistics regarding the number of pupils under normal training in mission schools, since in most cases instruction in this department is given in collegiate and training schools to special classes, of which separate records are not kept.

In probably a majority of the mission boarding schools for girls, domestic economy is taught. This is not the domestic economy of Occidental life, but of the life of the pupils among whom the school is established and for whom it works. Attempt is made to avoid training the girls into ways of living that will not be in harmony with their life after graduation. It was once thought necessary to introduce Western ways into Asiatic schools and to teach these ways to the pupils; but wiser counsels are now prevailing. The girls in boarding schools, as, for instance, in India, are taught to prepare the foods of India with Indian apparatus, and to serve these foods in the best possible way with the equipment an Indian kitchen affords. In most of the boarding schools each pupil is expected to have a share in the domestic economy of the institution, under wise and competent teachers, so that when she completes her course she will carry to her home the highest domestic skill to be found in the country.

In some instances, where it is expected that pupils will be brought into contact in their after life with people of the West, or where it is anticipated that Western customs will pre-

vail more or less in their homes, Western phases of domestic economy are introduced into the school; as, for instance, in great centers like Tokyo, Bombay, and Constantinople, certain girls are taught the domestic economy of the West, which consists of the preparation of Western food in a Western way and the serving of those foods at a table as it would be served in Europe or the United States. At the same time, the pupil is taught to sit at the table and to carry herself in a way that would be acceptable in good society in the West.

This phase of domestic economy is not widely extended, but it is important, since not a few of the graduates of these institutions, especially the girls' colleges, become wives of professional men who either themselves go to America or to Europe with their wives or are called upon to entertain Western men of note in their homes. In all such cases a knowledge of Western customs is of great value. But for the most part the domestic economy taught in the mission schools is that of the country wherein they are located.

Collegiate Institutions.—The missionary colleges were in many instances the first institutions of higher learning to be developed in the countries in which they exist to-day. This statement is true of Turkey, Persia, Bulgaria, India, Burma, Ceylon, Korea, and Africa, and, viewed from a Western standpoint, of China and Japan. They were the natural outgrowth of the village school, and have come into existence at the demand of the people for modern Western education, accompanied by the need in missionary work for thoroughly trained native leaders. It is this requirement of the missionary work, together with the aspirations of those who sought an education for its own sake and for what it would bring to them in the way of advancement, that has made the missionary college a significant institution in the East to-day. It must be remembered that many high schools, and even ordinary boarding schools under missionary direction, have been given the name "college." This weakness, on the part of certain missionaries, for a high-sounding name has brought discredit, in some countries, upon the missionary college. At the same time it cannot be denied that missionary colleges have been, in most cases, the foremost institutions for higher Western learning in the countries where they have been established; and in lands like Turkey, Africa, India, Ceylon, Burma, China, and Korea they stand without a rival. The development of missionary colleges within the last generation has been rapid. In 1850 there was hardly a missionary school that bore the name "college." The real collegiate movement began in the last quarter of the last century. The development of the college is quite parallel with the awakening of the Asiatic races, and may be regarded as a part of that awakening.

The courses of study in these colleges are

on a par with the curricula of the ordinary colleges of the United States and Canada, and many of the denominational colleges of Great Britain. Not so much emphasis is put upon the dead languages as upon the living, and in all these institutions the native tongue of the missionary in charge is made the principal foreign tongue; as, for instance, in the French missionary colleges, French is the principal foreign language; in the German colleges, German, and in the English colleges, English.

These institutions have been most satisfactorily patronized by the people. They are more largely self-supporting, because of the heavy tuitions the people themselves pay, than are similar institutions in America and Europe. It has been currently reported that the American colleges in Turkey, all of which have grown out of the missionary work there, have had unusual influence in shaping the new Turkish Empire and in preparing the minds of the people for constitutional government. It would be impossible to overestimate the place which the missionary colleges to-day hold in the great national movements of the East and the influence which they exert over the minds of the young men and young women coming forward rapidly to positions of leadership among these awakening nations. These colleges have formed the model upon which private and national collegiate institutions have been created.

More than 25,000 of the brightest young men and women in the Nearer and the Farther East are to-day receiving a thorough higher education in the collegiate and training institutions which Protestant missionaries have established, and which directly or indirectly they sustain. This means the graduation of some 4000 young men and women each year to take positions of commanding influence among their own people. The Catholic missionaries furnish no distinct statistics covering this grade of work.

Medical Colleges.—The medical college is an outgrowth of the medical as well as of the general educational missionary work. Even to the present time there have been not a large number of medical colleges established in mission fields, but a few of these are of a high order and rapidly developing, as, for instance, the Medical College at Peking, China, in which six different organizations unite and which is already recognized by the imperial government; also the Syrian Protestant Medical College at Beirut in northern Syria. In China, in India, and in Turkey, as well as many other of the Eastern countries, the first modern scientific medical education provided for young men has been given through the missionary medical college and by the medical missionary in the form of personal instruction to native assistants. There are some 1000 students in the distinctly Protestant missionary medical colleges, besides medical missionary assistants

and nurses numbering several thousands. The Roman Catholics furnish no statistics.

Industrial Schools.—Industrial schools are the least systematized and the poorest developed of any of the educational institutions connected with missionary work. They are probably the least scientifically conducted. The first idea of the industrial mission school grew out of a desire to provide for needy pupils some means by which they might earn a part, at least, of their own support, while securing an education. For that purpose industries were introduced with the main object of furnishing food and clothing for the students practicing them. This was followed by the idea of teaching pupils some trade by which they might earn their livelihood after they had finished their education. The necessity for this vocational training grew out of the persecution which the Christian student often received and which handicapped him in industrial competition. This part of missionary work has not, on the whole, proved a success. Missionaries have not shown themselves capable of teaching trades to Asiatic young men by which they may earn a livelihood after going out into the world. Instances are comparatively few where students graduating from an industrial school have successfully pursued the trade studied in the school.

At the present time industrial work is taking a somewhat modified form, and will probably be widely developed along this line; namely, to teach the pupil to use the tools of his country and produce that which the people themselves require, and to do it at a price that will make it possible for him to live thereby. Altogether too many of the industrial schools have taught the pupils to produce goods which could not be sold except in a foreign market and through the missionary agency. One thing has been accomplished by all these forms of industrial work; namely, the pupils have been taught the dignity of labor, and their minds have been dispossessed of the false impression so prevalent in the East that a scholar must not do manual labor. The results in this direction have been most beneficial.

There is an independent line of industrial work for women which needs to be mentioned. This consists largely of lace making and needlework, and has been, in large part, for the purpose of furnishing them a means of livelihood. The results have been most satisfactory in that widows and others who without this would be beggars upon the street or something worse, have become self-respecting and independent, earning their living by the skill and labor of their hands. Industrial work of this kind on a large scale has been carried on, as, for instance, by Miss Shattuck at Oorfa, where thousands of widows and orphans were provided an opportunity to earn their living when Turkish massacres had cut off their every source of support.

The Roman Catholic missionaries do not publish reports of their industrial operations, although they are not behind the Protestant societies in teaching the dignity of labor and self-help and in instructing their pupils in various handicrafts. In Africa the demand for a fuller development of this line of instruction is on the increase.

Technical Schools.—The missionary technical school has not been widely developed, although at the present time the call is growing louder for the enlargement of this phase of collegiate education. The reason for slow development has been, without doubt, the great cost of the technical school as compared with the ordinary college. The colleges themselves have been poorly equipped, and the most of them are meagerly supplied with apparatus and with a proper teaching force. The demand for such technical schools in India, China, and Turkey is now insistent. It is probable that in China, as in Japan, the government will soon provide for this line of education. Few missionary societies will feel able to make the necessary outlay of money for the establishment of adequately equipped plants for full technical education.

Theological Schools.—The theological school has been a natural outgrowth of missionary work, and has for its object the training of Christian leaders for the newly organized churches and for general evangelistic work in the field. The purpose of the theological school is to train up natives of the country who will themselves bear the burden of the work which the missionaries at first bore, and to lead the native church into independence and self-support. These schools have been in many instances rude, and the development has not kept pace with the development of the missionary colleges and other educational institutions. About 12,000 Protestant young men in mission countries are now pursuing courses of instruction in preparation for the pastorate of native churches and for general religious leadership. Again we are provided with no statistics for Roman Catholic missions.

Agricultural Institutions.—In many different sections of the mission field, missionaries have done not a little to improve the agricultural conditions of the country by securing land and training young men connected with their schools in scientific methods of tilling the soil and raising crops. This phase of missionary work has never received much attention, although not a little has been done by the missionaries in many countries in introducing, through this line of education, better implements of agriculture and more scientific methods of farming as well as new seeds and vegetables from the West. There is at the present time much call in many mission countries for the establishment of agricultural schools. Plans are already being developed to have an agricultural department connected

with some of the existing missionary colleges. This work is eagerly desired by the people, and, if properly guided, would be of infinite value in raising the productive power of land as well as in increasing the quality of agricultural products.

Schools for the Blind.—The early loss of sight is probably one of the greatest afflictions of the East, but until Christian work began little or nothing was done for the blind. The missionaries have opened schools for the blind in many of the great mission centers. They have secured the printing of books for the blind in the languages of the country, and have opened schools in which blind children are taught not only to read, but to become self-supporting through the practice of some handicraft suited to their condition. These schools have made profound impression upon the people of the country, and are changing their attitude toward the helpless blind in a way that was not contemplated.

Something of the same line of work has been opened in many places for the deaf and dumb, and with similar results. This work as yet is not very extensive, but it has led, as in Japan, to calling the attention of the government to the necessity of doing something for this class of their citizens.

In Protestant schools for the blind and for the deaf and dumb there are 844 children under special instruction. The Roman Catholic figures make no report of these departments of training. This is one of the new lines of mission work, and probably as resources increase it will be rapidly developed.

Orphanages.—There are few missionary societies that have not at one time or another in their history opened schools for orphans, which have been practically orphanages pure and simple, but with provision for the intellectual as well as physical and industrial training of the children brought into them. The Roman Catholics have done more in this direction than have the Protestants. As a general thing the Protestant missionary societies have not regarded this as a permanent part of their work; but in countries which have suffered severe scourges of plague, famine, or massacre, it has been impossible for the missionaries to remain in the country and not open refuges for the reception of the great numbers of orphan children left absolutely without protection.

It was under such an impulse as this that the Protestant orphanages, for the most part, were opened. It was necessary to continue the work at least until that generation of orphans had received their training and had been placed in positions where they could become self-respecting, self-supporting members of society. The massacres at different times in Bulgaria and Turkey and the plagues and famines that have afflicted India in the not remote past have led to a large and necessary development of this line of work.

Among Protestant societies funds for the support of these orphan schools have been provided largely by special gifts for that purpose, and have not come directly from the treasuries of the missionary societies.

The Roman Catholic missionaries put greater emphasis upon orphan institutions than do the Protestants. Among the Protestants, in large part, orphan children are cared for in the boarding schools, and not in separate institutions. There are, however, separate orphanages, especially in India and Turkey, in which the latest reports show there are 20,206 children. In the orphanages under the Roman Catholic missionaries in the various countries of the world there are 89,699 children.

Japan.—When Protestant missionaries entered Japan about 1860, they found a considerable degree of education in the country, but not of the Western type. As missionaries could reside outside of treaty ports only when employed by Japanese, it became necessary for those who wished to take up their residence in the interior to be connected with some Japanese institution, in whose employment they were registered in the government records. At the same time, the desire of the Japanese for Western learning was increasing, and many Europeans and Americans were called to Japan to teach in the government schools. The mission schools were eagerly sought by the young men and young women of Japan as affording unusual opportunity to study English, constitutional government, history of Western nations, and, what may seem rather strange, the fundamentals of Christianity. In some of the earlier schools, as, for instance, those under the direction of the famous Guido Verbeck, the two subjects which were most eagerly sought by the Japanese pupils, all of whom came from families connected with the *samurai*, or titled classes, were constitutional government and Christianity. A large number of the men who became foremost in the reorganization of Japan and the development of constitutional government were pupils in those early mission schools.

Mission schools have a reputation for maintaining a standard of English and of music which it is impossible for the government schools to surpass. They also are said to have developed a strength of character in their students noticeably lacking in government schools. These mission schools exercise great care in the selection of teachers, basing school government upon Christian principles. The historic foundations of Christianity are taught to all the pupils, although in none of them are there religious tests for admission or graduation.

The grade of school in which missionaries chiefly work is the *Chu Gakko*, or middle school for young men, and the *Koto Jo Gakko*, or middle and high school for young women. In the empire there are twelve such mission schools for young men and forty-five for young women.

These are all beyond the experimental stage, no new schools having been opened in recent years.

The total number of young men who have received more or less instruction in the Protestant mission schools in Japan is about 25,000. From three to four thousand of these are graduates of the schools, either of the middle or higher course, or of both. Of those who have received or are receiving instruction, about 3 per cent are in the Christian ministry or some other form of special Christian work; 12 per cent are teachers in either mission or government schools; 5 per cent are officials under the government; 28 per cent are in some form of business; 1 per cent in military service, and 2 per cent in various other callings, while 7 per cent have died; 35 per cent are still in schools, and the rest are unreported.

There are certain professions in which almost no graduates of mission schools are found, namely, the military, medical, and legal. About 700 of the graduates of mission schools are engaged in farming, manufacturing, commerce, and in various arts and professions. Not a few are managers of banks and presidents of commercial companies. There are 117 graduates of mission schools who are active in official and political life, and among these a considerable proportion have risen to prominence. They hold positions in city and *ken* offices, postal and customs service; they are members of the Upper and Lower Houses of Parliament, mayors of large cities, and diplomats. It is, however, in the realm of ideas rather than in business or official life that the former pupils of mission schools have especially distinguished themselves. Here they have exerted their widest influence over social and national progress in Japan. It has been said that the sign "Importers of new ideas" might appropriately be hung over the entrance of every mission school in the empire. The graduates of these schools are prominent in teaching positions, even in the highest national schools.

It is stated on good authority that the students in mission schools originated magazine literature in Japan. They also hold prominent positions in journalism, many later graduates choosing that as a profession. The following is only a partial list of prominent Japanese journals which have graduates of mission schools either as editors-in-chief or as prominent members of the editorial staff: *The Mainichi Shimbun*, *The Kokumin Shimbun*, *The Hochi Shimbun*, *The Osaka Asahi Shimbun*, *The Nagoya Fuso Shimbun*, *Kagoshima Nichi Nichi Shimbun*, *The Chinzei Nippo*, *The Tokyo Asahi Shimbun*, *The Yorozu Choho*, *The Kahoku Shimpō*, *The Sendai Nichi Nichi Shimbun*, *The Jitsugyo no Nihon*, *The Eibun Shinshi*, *The Boken Sekai*, *The Bunko*, *The Waseda Daigaku Shippun Bu*, *The Chuo Koron*, *The Taiyo*, *The Jinsen Chosen Shimpō*, *The*

Moji Shimpō. In the field of authorship, students from these schools present an equally interesting record. Eminent national poets, historians, lecturers, and authors on topics connected with education and sociology, as well as novelists, have come from these schools, and their writings have exerted and are exerting a strong influence on the thought of the empire. In fact, these have led the way in creating a new literature for Japan, a literature that is rapidly familiarizing the whole nation with the best ideals of the West. It naturally follows that the Christian press of Japan is under the direction and control of former pupils in these schools. All of the editors-in-chief of the Christian papers are of this class, and most of the assistant editors and contributors have received the same training. The leaders in the Y. M. C. A. movement in Japan are from the same class. The Doshisha, a Christian university established in Kyoto by Dr. Necessima, has a national reputation, and its graduates are sought for important positions because of the record they have made for moral strength, stability of character, and integrity of purpose.

In the education of girls in Japan, the mission schools have taken the lead, and have been of great influence in stimulating the government to make better provision for female education. It is impossible to follow the course of the graduates of mission schools for girls in the same way that we can follow the graduates from the schools for boys and young men. Most of these graduates are soon found in homes of their own. It is impossible to trace the influence of those homes, presided over by a Christian woman or one who has been trained in Christian schools, in shaping a new order of society in Japan. The number of mission schools for girls is reported as forty-five, with ninety-three mixed schools, including fifty-four kindergartens. There are twenty-two theological schools in the empire, conducted by missions, fourteen schools for training women for special forms of Christian work, and five kindergarten training schools for the education of kindergartners. The Roman Catholics have about eighty schools of all grades, attended by about 8000 pupils, but no data are given regarding the grade of these schools or the walks of life into which these students enter after graduation.

China. — As a nation China has been more favorable to higher education than any other great country of the world. For the last five hundred years, indeed, official positions have been more completely based upon a civil service examination than in any other country. This national education, however, contained nothing that is regarded in Europe and America as part of the curriculum of any educational system. While the national education gave a certain measure of mental discipline, it did not inform the student regarding the outside

world, nor was anything in the line of science or mathematics included. The basis of the old educational system of China was the Confucian classics and Chinese history. (See CHINA, EDUCATION IN.)

Protestant missionary work began in China in 1807, and for a century endeavor has been made to exhibit to the Chinese the value of "Western learning," as this system of education was quickly named by the Chinese themselves. Acceptance was slow. Perhaps one of the most far-reaching results has been the turning of the minds of Chinese youth toward the Western world, which has resulted in sending to America and Europe a considerable number of young men for educational purposes. Not long since, the Chinese Students' Association, made up of several hundred Chinese youths studying in American universities and colleges, reported that over 80 per cent of their number came from mission schools in China.

Missionary education has received a great impulse since 1900, following the reorganization immediately after the Boxer Movement. The revival of Western learning in China is coincident with the inauguration of the new order and the development of the idea of constitutional government. Mission schools which were long tabooed by the masses of the people then became popular; the government system of education was changed by imperial order, and Western learning was made the basis of the official education of the Chinese empire. No longer does the old system prevail, and the new government is endeavoring to build up its own educational system on the model laid down by the missionaries and brought back to China by the Chinese students who have taken degrees in European and American universities.

It is impossible here to trace the history and development of the Protestant educational propaganda, and we can give only a summary of the work of seventy-three missionary societies in China. There are eighteen missionary universities and colleges in the country, with a total attendance of 919 students in the collegiate departments. These institutions are pretty well scattered throughout the empire, with locations generally at great political and influential centers, as, for instance, two in Peking, two in Foochow, two in Canton, and others in Nanking, Hankow, Wuchang, etc. In theological, normal, and training schools there are 2544 students; in the boarding and high schools, 20,866; and in the elementary and village schools, 54,964; making a total in all the Protestant mission institutions in China of about 80,000 Chinese children and youth. To these should be added 122,000 pupils in Roman Catholic schools, the most of whom are in middle or primary grades, with one sixth of the entire number in orphanage schools; making a grand total of 202,000 Chinese youth in mission schools in the country.

Turkey. — There is probably no country in which mission schools have figured more prominently in the development of the intellectual and social life of the people than in the Turkish empire. The work of missionary education was begun in Turkey in 1820, and has been continuous to the present time. Until very recent years the missionary schools were the only ones based upon scientific methods of instruction. The pupils in these schools, which quite generally cover the empire north of Arabia, have come largely from the Syrian, Greek, and Armenian communities, although there have been in them all some pupils of other nationalities. Owing to the alertness of the Armenian and Greek minds and the readiness with which they have sought education, the mission schools in Turkey have developed into colleges more rapidly than in any other country, and, in the absence of government institutions to supply the need of higher education, these mission colleges have occupied a place in the empire which such institutions have assumed in few if any other countries.

To-day the mission colleges in Turkey, and institutions which have grown out of missionary work and are substantially a part of it, are affording the highest and most thorough scientific training available for young men and young women. As illustrations we mention Robert College (*q.v.*) on the Bosphorus, which, although never under missionary control, has always had a missionary for its president, and has been conducted along precisely the same lines as missionary institutions; the Syrian Protestant College at Beirut, which began as a missionary school, but has since become independent under a separate board of trustees; and the American College for Girls at Constantinople, once missionary, but now independent.

Collegiate education for women has reached a high stage of development in Turkey. The Greek and Armenian races have been responsive to the call for the higher intellectual training of their women; and in response to this call three colleges have developed, the Central Turkey College for Women at Marash, the International Woman's College at Smyrna, and the college already referred to at Constantinople. Euphrates College at Harpoot in Eastern Turkey has two departments, one for women and one for men. The girls' high and boarding schools at Marsovan, Aintab, and Beirut have reached a stage of development which carries their pupils into the collegiate grade, although as yet these institutions do not bear the college name.

The influence of these colleges upon Turkey cannot be measured by the rolls of their pupils. A great number of national schools have sprung up among the Greeks, Armenians, and Syrians, as well as other nationalities, which employ teachers who were trained in mission schools. In this way modern missionary education has penetrated into the remote sections of the

Turkish empire and has prepared the people not only for constitutional government, but for the adoption of a general system of education which the new régime in Turkey is now endeavoring to establish. Many of the native teachers engaged in these collegiate institutions in Turkey have received special training in European and American institutions. A majority of the American colleges in Turkey are incorporated under the laws of Massachusetts or New York, and are partially endowed.

In these institutions to-day there are about 5000 young men and young women, natives of Turkey, taking a general course of instruction. This number includes the pupils in the preparatory departments, but does not include pupils of high school grade in institutions outside. The boarding and high schools, with the elementary and village schools in the empire, have over 40,000 scholars, making a total, with the normal and industrial institutions, of more than 48,000 pupils receiving their training in Protestant missionary schools. The Roman Catholics have extensive educational plants, in which some 68,000 pupils are receiving instruction under Christian training, making a total of nearly 120,000 children of Turkey receiving their education in mission schools.

One of the Moslem leaders in the inauguration of the new constitutional government in Turkey stated that they would never have dared to undertake such a bold step, had they not relied upon the influence of the missionary educational work which has been carried on in Turkey for two generations to sustain them and to make constitutional government possible.

India. — Beginning with Ziegenbalg, Plütschen, Schultze, and Schwartz in the eighteenth century, missionaries inaugurated an educational program which has since played an important part in the development of the intellectual life of modern India. In 1728 the Christian Knowledge Society began work in the Madras Presidency, and from that day to the present, Christian missionaries have been engaged in a multitude of forms of educational work. The first decided attempt at female education was undertaken in 1800. The government system of education was based upon Sanskrit, Arabic, and Persian, while the missionaries made use of the common vernacular and placed emphasis upon religious instruction. Dr. Alexander Duff, an early missionary, made a remarkable record as an educator. (See *INDIA, EDUCATION IN*.) Of forty-eight young men who were under his tuition, nine became ministers, ten catechists, seventeen professors and high-grade teachers, eight high-rank government officials, and four physicians and surgeons. He was especially influential in shaping the educational policy of the Indian government, which is now of almost universal application in India, Burma, and Ceylon.

In India and Ceylon the government method

of carrying on its own educational work is largely through a subsidy to those mission schools that come up to the government standards and meet the requirements. In Ceylon, for instance, the support of the missionary primary and village schools comes almost wholly from the government grant, and in a large number of the schools in India by far the greater proportion of the funds for maintenance is supplied by the government. The schools thus aided are under the regular inspection of government officials, and the grant is based upon the number of pupils in the schools that reach a fixed standard. These grants are also given in still more liberal form to industrial institutions.

In the Protestant missionary school system in India there are thirty-seven collegiate institutions well scattered over the empire and directly connected with the Indian university system. In these colleges, nearly all of which are for young men, there are about 5000 matriculated students. In the 141 theological and normal schools there are 77,400 students. In the industrial training institutions and schools there are 9000 pupils, although there are many pupils in other institutions who are receiving regular industrial instruction. In the elementary and village schools of the country there are 362,000, with about 1000 in the missionary kindergartens. This makes a total in the Protestant missionary schools of all grades and classes in India, and representing eighty-five missionary societies, of about 458,000 children.

The island of Ceylon, although not densely populated, furnishes a good illustration of the influence of missionary educational endeavor. While in the entire island there is a population of only about 3,988,000, in the Protestant missionary schools on the island, consisting of three university and collegiate institutions, seven theological and normal training schools, forty-four boarding and high schools, six industrial institutions, and 871 schools of elementary village grade, there is a total attendance of 63,000.

The Roman Catholic figures for India and Ceylon report a school attendance of 225,000, making a total of pupils in these two countries in Protestant and Roman Catholic mission schools of 819,000 who are receiving their instruction in missionary institutions.

Africa. — Africa, unlike other countries that are named in this list, is not a united or compact empire; it represents no single government, and has no native administration at any point which is now developing education. Under the British flag the government is beginning to render some assistance to primary, intermediate, and normal education for native populations, but this affects only a limited area. Very little is done by the French and German governments, and perhaps less by the Portuguese in this direction. There is no country

MISSIONS

here named that is so dependent at the present time upon the educational work developed and carried on by missionaries as the continent of Africa. There is, moreover, little hope that in the near future any form of native government or of the foreign governments holding control in Africa will take advance steps in this direction. This being the case, the missionary educational work has the greater significance.

It should be stated also that in missionary education in Africa there is an increasing consciousness that the system that will be most valuable in the future must be more or less connected with some form of industrial training. While the African learns to read and write, he, by this method of training, is also learning new processes of agriculture, how to make brick and tiles for his home, how to construct his home according to improved modern methods, how to make his own agricultural implements and tools and furniture, and to do many other things which belong to a more civilized society. These processes of education are going on at the mission centers in different parts of the great African continent.

As might be expected, higher education in the line of collegiate work has been but little developed up to the present time among the natives of Africa. There are few institutions which should bear the name of college or university, and the number of students in these to-day aggregates less than two hundred. In theological and normal institutions that are training preachers and teachers for the lower schools, statistics show that there are over 2500 African youth receiving training. In the mission boarding and high schools the number of pupils passes the 20,000 mark. It is, however, in the elementary schools that the largest number of African youth are found. Protestant mission institutions of elementary grade in Africa, exclusive of the work carried on in Egypt, number over 405,000 pupils. Taking all of the Protestant mission institutions together, exclusive of Egypt, there are now under missionary instruction in Africa, in schools of all grades, a little more than 432,000 youth and children. This is probably largely in excess of the number of native youth in all of the other modern and equipped schools in the entire continent. The Roman Catholics have in schools under the direction of their missionaries in all Africa, also exclusive of Egypt, a school population of over 400,000. The figures which they furnish are not capable of as careful analysis and classification as the figures provided by the Protestant societies. This makes a total missionary school attendance of native African pupils of 832,000.

Statistics.—The following statistics will show the present strength as well as the growth of Protestant missionary educational work during the last decade, though these figures are changing rapidly:—

MISSIONS

PROTESTANT

AMERICAN MISSIONARY SOCIETIES

	SCHOOLS	PUPILS
1900	6,252	240,263
1905	8,638	303,835
1909	9,949	437,138
1910	10,632	515,108

ENGLISH SOCIETIES

	SCHOOLS	PUPILS
1900	9,160	437,874
1905	11,447	628,407
1909	10,649	604,675
1910	11,179	662,723

GERMAN SOCIETIES

	SCHOOLS	PUPILS
1900	2,022	97,587
1905	2,466	120,817
1909	3,373	150,021
1910	3,130	159,547

CONTINENTAL AND OTHER SOCIETIES

	SCHOOLS	PUPILS
1910	5,274	224,661

The totals of schools and pupils, together with the summary of the schools of Christendom, are as follows, with their growth for the last decade:—

	SCHOOLS	PUPILS
1900	20,196	1,035,724
1905	27,835	1,246,127
1909	29,190	1,413,995
1910	30,215	1,562,039 ¹

¹ About one fourth of these are girls.

Figures showing the growth of the Roman Catholic missionary educational work are not available, but the following statistics of the pupils recently reported show the number of students under Roman Catholic instruction under three classifications:—

ROMAN CATHOLIC

In Lower Schools, including Primary	840,974
In Middle Schools (approaching the Boarding and High Grade in Protestant Statistics)	66,399
In Orphanages	89,699
Total	997,072

Their figures do not indicate the proportion of girls among the pupils under instruction.

Grand total of pupils in missionary schools in all mission countries:—

Protestant	1,552,039
Roman Catholic	997,072
Total	2,549,111

Cost of Missionary Schools.—It is difficult to state accurately the amount which mission boards and societies of Christendom at the present time are using annually for the support and development of educational work in their various mission fields. Including the support of those who are engaged in whole or in part in educational enterprises, together with the subsidies given to schools of various grades and character, it is probably not an exaggeration to say that at least \$6,000,000 a year go directly or indirectly into the various Protestant missionary educational enterprises, in Africa and the Nearer and Farther East. A large part of the cost of this educational work is carried by the natives themselves. It can be said without exaggeration that the educational institutions that are called missionary around the world are carried on at an annual cost of not less than \$12,000,000. It should also be stated that not a few institutions, all of which are here classified as missionary either in origin or in character and spirit, have organized themselves under separate boards of trustees, with charters from different states. This has been done in a large number of instances for the purpose of securing more funds for their support. Many of these stand to-day as distinctively missionary, and all are classified as Christian and are supplementing missionary work.

Coöperation.—During the last decade there has been a marked movement among the mission boards of various denominations to combine their efforts along higher educational lines in union collegiate and theological institutions, and all in the interests of economy and greater efficiency. This movement is progressing rapidly, and union Christian missionary institutions are constantly increasing in numbers, strength, power, and influence through the combined support and coöperation of two or more missionary organizations. Good illustrations of this are the North China Union Colleges at Pekin, in which three or more missionary societies unite (these include a college for young men, a college for young women, a theological seminary for young men, a men's medical college, and a women's medical college); the Union College at Nanking, in which three missionary societies unite; the Union Educational Movement in Chengtshien in China, in which more than half a dozen missionary societies join; the Union Theological College in Bangalore in southern India, participated in by several different communions.

Another marked step is now contemplated,

which may not be classed as strictly missionary, but which probably indicates another step in the development of missionary education. The universities of Oxford and Cambridge in England and one or two universities in Scotland are uniting with several institutions in America, including Harvard University, McGill University in Montreal, and the University of Toronto, in developing a Christian university in Wuchang, China. It is expected that this university will be closely affiliated with the missionary colleges already established at that center, and that other missionary organizations will join in the plan.

Other institutions also are maturing along a somewhat similar line in other parts of China, as, for instance, the Yale Educational Mission in Chang Sha and the Harvard Medical Mission in Nanking. These indicate another step in the development of educational work of missionaries and institutions which are in sympathy and close cooperation with the original missionary enterprises.

The Place of Christian Colleges in the Educational Systems of Christendom.—It is a significant fact of history that the leading educational institutions of Christendom had their origin in schools which were started by the Church and for the primary purpose of strengthening and perpetuating the Church. Out of these church institutions have grown the great universities of England and America. The state universities followed long after, and received their inspiration and impulse from these church institutions. The educational awakening upon the continent of Europe in the seventh and at the beginning of the eighth century is traceable to the influence of the Irish-Scotch missionaries, who, wherever they located, founded centers of learning. Rashdall in *The Universities of Europe* declares that "so much of the culture of the old Roman world as survived into medieval Europe survived by virtue of its association with Christianity." "It was only among churchmen that an educational ideal maintained itself at all."

Dr. James S. Dennis says: "The pioneers of the educational revival of nations outside Christendom have been the missionary teachers who have always striven to have this mental awakening identified with Christian enlightenment. In this they have succeeded to an extent that is not surpassed in the educational provisions of the most favored communities of Christendom."

Reasoning not only from this analogy, but from modern movements which are distinctly traceable at the present time in many of the leading Asiatic countries, there is reason for assuming that mission schools started in the great East and in Africa by the Church are already becoming the nucleus and foundation for still greater and more advanced educational systems. Again the Church is proving itself

MISSISSIPPI COLLEGE

the pioneer of the intellectual development of races and nations. J. L. B.

MISSISSIPPI AGRICULTURAL AND MECHANICAL COLLEGE, AGRICULTURAL COLLEGE, MISS.—A state institution founded in 1878 as a land grant college for the benefit of agriculture and the mechanic arts. The college offers a two years' industrial training course, two years' training course for teachers, and a four years' course in agriculture, engineering, textiles, and education, leading to the B.S. degree. The entrance requirements are equivalent to a good knowledge of the common school branches. The enrollment in 1910-1911, including the summer school, was 1390. There is an instructing staff of sixty-five members.

MISSISSIPPI, STATE OF

MISSISSIPPI COLLEGE, CLINTON, MISS.—Founded in 1826 as Hempstead Academy, and now under the auspices of the Mississippi Baptist Convention. Preparatory and collegiate departments are maintained. No entrance requirements are stated. Degrees of A.B., B.S., and Ph.B. are conferred. The enrollment in 1911-1912 was 415. The teaching staff consists of twelve members.

MISSISSIPPI, STATE OF.—As first organized in 1799, the territory included the present states of Alabama and Mississippi. In 1817 the territory included within the present state was admitted to the Union, as the twentieth state. It is located in the East South Central Division, and has a land area of 46,362 square miles. In size it is about the same as New York. For administrative purposes the state is divided into seventy-nine counties, and these in turn into school districts, black and white, and special school districts. In 1910 Mississippi had a total population of 1,797,114, and a density of population of 38.8 per square mile.

Educational History.—There seem to have been no schools of any kind in the territory preceding 1795. A few private schools were opened by 1800, and in 1801 "the first public female school" in the territory was opened, though doubtless on a tuition basis. In 1802 the territorial legislature chartered Jefferson College, though it was not opened until 1811. Up to the time of its admission as a state the territory had done nothing beyond the establishment of a few tuition academies.

The only mention of education in the constitution of 1817 was a declaration, adapted from the N. W. Territory Ordinance, to the effect that "religion, morality, and knowledge being necessary to government, schools and the means of education should forever be encouraged in this state." The first legislature, meeting in 1818, passed an act giving the care of the sixteenth section lands to the judges of the county courts, to protect and lease, and with power to provide one or more schools in each county, as they might deem best. In 1821 a "Literary Fund" was constituted, additional sources of future income were specified, and a State Board of Directors was created for the management of the fund. A board of five to ten commissioners was provided for each county, to distribute the fund to a school or schools for the aid of such poor children in the county as might be selected, with the assent of their parents, to be taught reading, writing, and arithmetic. The income from the fund was to be used only for the building of schoolhouses and for the education of the children of the poor. The county school commissioners were to appoint, annually, a visiting committee to visit, examine, and report to the directors of the State Literary Fund, as to the condition of all schools. A form of teachers'

certification, by the directors of the Literary Fund, was also provided for. Three years later this law, which had been a dead letter, was virtually repealed by a new law making the township the unit. Five trustees of schools and school lands were to be elected annually in each township, and they were to build schoolhouses on the school section, employ teachers, and lease the school lands. Practically nothing was accomplished under any of these early laws. The new constitution of 1832 merely reproduced the brief and inadequate section on education contained in that of 1817, and no attempt to organize schools was made for some years. In 1833 the Literary Fund, which had by this time reached \$50,000, was distributed to the different counties for investment, and the state system of education provided for in the law of 1821 was abandoned.

About 1844, owing to immigration, increasing illiteracy, and the general agitation for education then going on in many states, the question of education in Mississippi began to attract new attention. In 1844 the University of Mississippi was created; in 1846, despite bitter local opposition, funds to establish it were voted; and in 1848 it began instruction. The central figure in the campaign for schools was Hon. A. G. Brown, Governor of the state from 1844 to 1848. In his inaugural in 1844 he pleaded with the legislature for a general system of common schools, open to all, and free to the poor. In 1846 a school law was finally enacted. This created boards of five school commissioners for each police district; established county school funds; and gave the commissioners power to open schools, license teachers, and levy specific taxes; but contained a proviso whereby no tax could be levied without the consent of a majority of the heads of families in each township, and made the law inoperative in any township if a majority filed a protest in writing against it each year. This almost completely nullified the law. The commissioners were to look after the sixteenth section lands and funds, and to report to the Secretary of State, who was made *ex officio* a general school commissioner for the state. The law proving ineffective, the ruinous policy of special laws for cities and groups of counties was begun in 1848, and this completely destroyed the chance for any general school system. Practically all of the succeeding legislation up to 1860 was of this character. The Civil War put an end to all of these efforts.

A new constitution was formed in 1868, which provided for a complete system of free public instruction for all children in the state. Rejected by the people in June, it was finally accepted by them in December. The section on education provided for a State Board of Education; for state and county superintendents; for a four months' school in each school district; for the establishment of

a state school fund, by consolidation and additions; for a poll tax, for educational purposes; for general state taxation; for the establishment of an agricultural and mechanical college; and forbade sectarian control of any school funds. The detailed law of 1870 carried most of these provisions into effect, and established the first real state school system the state had known. County superintendents were to be appointed by the State Board of Education; each county and each city of 5000 population was created a school district; boards of subdistrict school directors were also created to look after and manage the school; county taxation of ten cents on the \$100 for a schoolhouse fund and five cents for a teachers' fund was authorized; county examination and certification of teachers was provided for; and a form of the county system of school management was inaugurated. The law and the system of school taxation encountered much opposition, for many years, and the idea of popular education was combated openly and covertly. In time, however, the system was accepted, and slow but steady progress was made, although for a long time the schools were kept without a definite plan. What one legislature enacted the next modified or repealed.

In 1871 the Alcorn Agricultural and Mechanical College for negroes was opened. In 1873 the boards of district directors and the subdivision system were abolished, and their functions turned over to the county authorities. The patrons of each school were permitted, however, to elect trustees to care for the property, visit the school, and recommend teachers for election. A general state school tax of forty cents on \$100 was levied, the proceeds to be distributed on census, though this was later changed to a fixed biennial appropriation. All schools were divided into two grades, corresponding to primary and grammar, and the monthly wages of teachers in each were fixed by law. In 1878 an agricultural and mechanical college for whites was established, and opened in 1880; and in 1885 a state industrial institution for whites was opened at Columbus. The system thus established weathered the political revolution of 1875-1876, and remained almost undisturbed up to 1886, when a complete revision of the school law was made. Uniform state examinations for teachers were instituted, and standards for teachers' certificates were insisted upon for the first time; county teachers' institutes were established; county superintendents were directed to fix the salaries of teachers in their counties according to a definite schedule, based on the certificate held and on evidence of teaching capacity; the payment of teachers was changed from a yearly credit to a monthly cash basis; and towns were permitted to form separate school districts, and to tax themselves for buildings and maintenance. This law has since remained the basis of the Mississippi school system.

Most of the educational provisions of the constitutions of 1868 were readopted in the new constitution of 1890, and a number of additions were made. The additions in the new constitution prohibited special or private laws for the benefit of any private or common schools; permitted the use of the Bible in the public schools; increased the amount of poll tax for schools; practically made the maintenance of a four months' school by state taxation and funds mandatory; established a literacy test for the exercise of the suffrage; made the maintenance of separate schools for the two races mandatory; and confirmed the establishment of an agricultural and mechanical college for each race, from the proceeds of the Congressional grants. Few changes were made in the school law following the adoption of the new constitution, the revision of 1886 still forming the basis for the state educational system. In 1893 the Peabody Fund established an Institute Conductors' Training School for the state, and grants for teachers' institutes were made by it to the state for a number of years. In 1896 the State Board of Examiners was created, with power to grant higher state teachers' certificates, to assist the Superintendent in the preparation of all examination questions used in the state, and to transfer teachers' licenses from one county to another. Epidemics of yellow fever and smallpox interfered greatly with the schools from 1896 to 1900, and almost no educational progress was made during this time. In 1904 a State Textbook Commission was created, and the first uniform state series of textbooks was adopted in 1905. In 1908 a law regulating child labor in factories was enacted, and in the same year a bill was passed providing for the establishment of an agricultural high school for whites in each county, with a county tax on all property up to two mills, for support, and with state aid of \$1000 per school; but in 1909 this was declared unconstitutional. During the ten years from 1900 to 1910 there were two small increases in the annual state appropriation for schools, but there was little legislation of importance. By the legislatures of 1911-1912 much important educational legislation was enacted, the results of which are noted in the following section.

Present School System. — At the head of the present state school system in Mississippi is a State Superintendent of Public Education, a State Board of Education, a State Textbook Commission, a State Board of Examiners, and a State Board of Control for the higher educational institutions of the state. The State Superintendent is elected by the people for four-year terms, and has an annual salary of \$2500. He is given general supervision of the public free schools of the state, and may prescribe rules and regulations for their organization and conduct; prepares all printed forms and blanks; renders official opinions,

and construes the school laws; meets the county superintendents for conference; apportions the school funds semi-annually; requires annual reports from the county superintendents; and submits an annual report to the legislature, showing the condition of the schools. He is also *ex officio* a trustee of the State University, the State Agricultural and Mechanical College, the State Industrial Institute and College, the Alcorn Agricultural and Mechanical College, and the different state educational boards and commissions.

The State Board of Education consists of the Secretary of State, Attorney General, and State Superintendent. This board is a board of appeal from the decisions of the county superintendents, and has final jurisdiction; audits claims against the school fund; determines the allowance to the State Superintendent for contingent expenses; grants special certificates to teachers in Indian schools; may adopt a state course of study; names a list of institute conductors, and has oversight of the teachers' institutes in the state; and may make rules and regulations covering all matters of school administration not covered by law. The State Textbook Commission consists of the State Superintendent and eight educators, no two from the same congressional district, appointed by the Governor for five-year terms. This commission adopts uniform textbooks in the common school subjects for use in all of the schools of the state, and contracts with publishers for the same, districts being free to adopt supplemental books and books for higher branches taught. The State Board of Examiners consists of the State Superintendent and two teachers appointed by him, for four-year periods. This board prepares the examination questions used in all teachers' examinations in the state, and examines applicants for the county superintendency, and for state and professional teachers' certificates. The Board of Control consists of seven trustees appointed by the Governor, one of whom must be a farmer, one a lawyer, and one an architect, builder, or factory man. This board has full control of the four institutions of learning mentioned above.

For each county there is a county superintendent of public education, elected by the people for four-year terms. To be eligible for election to the office he must pass an examination on all the subjects required for a first-grade county certificate and on the art of teaching. The county superintendent acts under the instructions of the State Superintendent and the State Board of Education, and by law is required to employ all teachers for the schools, and to fix their salaries; to examine the reports of teachers and trustees; to enforce the course of study adopted by the State Board of Education, and the textbooks adopted by the State Textbook Commission; to enforce the rules and regulations in refer-

ence to the examination and certification of teachers; to visit and inspect the schools; to decide controversies (appeal to the State Board allowed in most cases); to keep a record of the proceedings of the county board of education, and of his official acts; to make annual reports to the board of supervisors, the mayor and aldermen of special city districts, and to the State Superintendent; and to instruct trustees as to their duties. For each county there is also a county board of education, a county board of examiners, and a county library commission. The county board of education is composed of the county superintendent, together with one member from each supervisorial district in the county, to be appointed by the county superintendent, with the consent of the board of county supervisors. The Superintendent may remove members for cause, and may fill vacancies. The board meets annually, and has few functions. Its chief duties are to define and alter the boundaries of the white and black school districts, and to locate schoolhouses; to approve the creation of special districts in unincorporated villages; to provide educational facilities for small numbers of isolated children; and it may locate the public school, in any school district, in connection with a chartered institution of learning and provide for joint control. If there is a sufficient number of Indian children in the county, the board may establish an Indian school for them. The county board of examiners consists of the county superintendent and two teachers holding first-grade teachers' certificates, appointed by him each year, prior to the September examinations. This board conducts the examinations of all teachers applying for teachers' certificates. The county library commission consists of the county superintendent, together with two teachers holding first-grade teachers' certificates, named by him. Their function is to select and publish lists of library books from which district libraries may purchase; to make rules and regulations for the control of school libraries; and to receive annual reports from each library in the county.

Each county is divided into ordinary school districts and "separate" or independent school districts. School districts may be formed by the county board of education, whenever there are forty-five children of school age of either race, but where the distance is too great, or where streams or lack of roads make attendance difficult, districts may be constituted for fifteen children. In the case of isolated families, ten children may be declared to form a "special" school district. "Line" (joint) school districts may be formed by the action of two county boards. Consolidated school districts have recently been provided for, with transportation for pupils living more than two miles from the school. Schools with a monthly attendance of less than five may be closed at

the end of any month. For each common school district the patrons elect a board of three school trustees, one each year, and for three-year terms. The election is held in annual meeting, the first Saturday in August, and the annual school meeting seems to have almost no other function. If the patrons fail to elect, the county superintendent appoints. The board elects one of its members as secretary, and may designate its choice for teacher to the county superintendent. If the trustees express no choice, or if the person chosen fails to secure a teacher's certificate, the county superintendent appoints. The final appointment, fixing of salary, and contract rests with the county superintendent. The trustees are to visit the school, provide fuel, care for the property, settle disputes (with appeal to the county superintendent), and may suspend or expel pupils. They can spend no money unless authorized to do so by the county superintendent.

Any municipality, by ordinance of its mayor and board of aldermen, may erect itself into a special school district. Similarly, any unincorporated district having sixteen square miles of territory, on petition of a majority of its electors, may be set off as a special district by the county board of education. All such special districts are financially independent of the county. For all such special districts a board of five trustees, for three-year terms, is appointed by the mayor and aldermen in cities, and by the county superintendent in unincorporated places. The powers and duties of boards in special districts are practically the same as in common school districts, and, in addition, they may employ principals and a superintendent; may elect their own teachers, contract with them, and fix their salaries; may maintain both graded schools and a high school, and may charge tuition for the latter; and may estimate needed funds, up to three mills, and submit the estimate to the aldermen or county supervisors for levy.

School Support. — Mississippi originally received 902,744 acres of land in the sixteenth-section grants, as well as two townships for a seminary of learning. Some of the sixteenth-section land is still unsold. The total common school fund of the state is now about \$3,500,000. The constitution of 1890 practically requires an annual state appropriation sufficient, with poll taxes and the interest on the permanent fund, to maintain all of the schools for four months each year. This state appropriation which at present is \$1,424,088 a year, constitutes the chief source of revenue for the school system. County taxation up to three mills is permissible, and is resorted to in a number of the counties, but the chief local taxation is in the special and financially independent (town and city) districts, where a seven months' school at least is always maintained. Tuition fees for high school instruction are still per-

mitted. To the county agricultural high schools is granted \$30,000 a year of state aid, and \$5000 a year to weak districts.

Educational Conditions.—The property valuation of the state compared with the population is very low, and this shows itself in the matter of school support. In percentage of children, five to eighteen years of age, in the total population (34 per cent); in the amount which each adult male must contribute (\$1.51) to produce \$1 of school money for each child; and in the small amount of school money raised for each child five to eighteen years of age; Mississippi is only surpassed by one state,—South Carolina. But little is spent on school buildings (34 cents per capita of attendance, at last report, as against an average for the United States, of \$6.45), and the average value of all school buildings in the state is only about \$300. The state has no cities of over 25,000, and 88.5 per cent of its people live in country districts. Of the total population in 1910, 56.2 per cent were black and 43.7 per cent white. In some counties the blacks outnumber the whites three, four, and five to one. 99.5 per cent of the population is native born. The average length of term of all schools is about seven months, while in country districts it is less than six. In 1908 a child labor law was enacted. The state has no compulsory education law as yet. The state has a school library law whereby any district which subscribes \$10 and provides a bookcase may receive a similar amount from the county school fund, though not more than ten districts can be aided each year, and no district can receive aid a second time, if other districts are applying.

Teachers and Training.—The state employed about 10,166 teachers in 1910, and at an average of about \$250 a year. County superintendents in employing teachers are limited by a state wage scale, varying from \$15 to \$75 a month for teachers, and up to \$100 for principals. Three grades of county teachers' certificates are issued, and only those holding a first-grade certificate can receive more than \$30 a month. The examination subjects are the common

school subjects, the grade of certificate varying with the percentages made in the examination. The state also issues two grades of certificates: (1) State licenses, which are the same as a first-grade county certificate, but, on examination, have been validated for the entire state; and (2) Life diplomas, which involve high school subjects, and are the only certificates issued which represent any educational standards. County teachers' institutes and summer normal schools have for years rendered a valuable service in educating the teachers of the state. The state has for some time made provision for the training of colored teachers at Holly Springs, and a normal school for the training of white teachers, located at Hattiesburg, was opened in 1912.

Secondary Education.—The public high schools are mostly of low grade, and most of them are still in part grammar schools, though in the nine cities of more than 8000 inhabitants, well-organized high schools are found. The recent legislation relating to agricultural high schools promises much for future development. In all, 137 high schools were reported in 1911, with 394 teachers and 7763 pupils enrolled. Seven public and twelve denominational schools offer secondary instruction to the colored race.

Higher and Special Education.—The University of Mississippi, founded in 1844 and opened in 1848, and located at University, stands at the head of the public school system of the state, though it is only within the past ten years that any real coordination between it and the public school system has been effected. The school of pedagogy of the university, established in 1893, has done a valuable service, serving as a form of state normal school for white teachers for the state. The university summer school for teachers has been well attended. The Mississippi Agricultural and Mechanical College for white students, founded in 1878 and opened in 1880, at Agricultural College, and the Alcorn Agricultural and Mechanical College for colored students, opened in 1871 at Alcorn, are also state institutions. In addition, these state institutions are assisted by the following:—

INSTITUTION	LOCATION	OPENED	CONTROL	For
For Whites				
Port Gibson Female College	Port Gibson	1839	M E. South	Women
Whitworth College	Brookhaven	1850	M E. South	Women
Central Miss Institute	French Camps	1886	Presb.	Women
Millaps College	Jackson	1892	M E. So.	Both Sexes
Belhaven College	Jackson	1894	Nonsect.	Women
Stanton College	Natchez	1894	Nonsect.	Women
Meridian Male College	Meridian	1901	Nonsect.	Men
Meridian Women's College	Meridian	1903	Nonsect.	Women
For Negroes				
So. Christian Institute	Edwards		Discip. of Chr.	Both Sexes
Rust University	Holly Springs		M E.	Both Sexes
Kosciusko Industrial College	Kosciusko			Both Sexes
Tougaloo University	Tougaloo		Congr.	Both Sexes
Mary Holmes Seminary	Westpoint		Presb.	Both Sexes

Many of these institutions are in large part preparatory schools; all have small endowments, and the collegiate work is of a somewhat elementary type.

The State Institution for the Blind, at Jackson; the Institute for the Deaf and Dumb, at Jackson; and the State Industrial Institute and College for whites, at Columbus, are supported by the state. The last named offers business, normal, collegiate, industrial, and music courses to both sexes. E. P. C.

MISSISSIPPI, UNIVERSITY OF, UNIVERSITY, MISS.—A state-maintained co-educational institution chartered in 1844 and opened in 1848, out of the endowment of one township granted by Congress in 1819. The institution has been liberally supported by appropriations from the legislature. The following departments are maintained: academic, education, engineering, law, medicine, pharmacy, science, literature, and arts. The entrance requirements are fourteen units. The university confers the degrees of A.B. and A.M. in science, literature, and arts; B.E. and C.E. in engineering; A.B. and B.S. in education; Ph.G. and Ph.B. in pharmacy; and LL.B. in law. The courses in the last two departments are two years in length. The enrollment in 1911-1912 was 480, and the faculty consists of forty-three members.

MISSOURI, STATE OF.—First organized as a separate territory in 1812, and admitted to the Union as the twenty-fourth state in 1821. It is located in the West North Central Division and in about the center of the Mississippi Valley, and has a land area of 68,727 square miles. In size it is about as large as all of New England and New Jersey combined, and about one third the size of France. For administrative purposes the state is divided into 114 counties and the city of St. Louis, and the counties are in turn divided into cities, towns, villages, and rural school districts. In 1910 Missouri had a population of 3,293,335 and a density of population of 47.9 per square mile.

Educational History.—The first school in Missouri is said to have been opened by J. B. Trabeau in 1774, and he is reported to have been teaching forty years later. The first attempt to organize a public school was made at St. Louis in 1817, when the village, acting under a territorial law, appointed a board of trustees to organize a public school. The

attempt was not successful, and it was not until 1838 that schools were opened there. (See ST. LOUIS, CITY OF.) The first constitution was framed in 1820. This contained two sections relating to education. The general assembly was instructed to preserve the school lands; apply the income as it should be; to establish at least one school in each township, "where the poor may be taught gratis," and "as soon as may be," to establish a university, as provided for in the grant of two townships for a seminary of learning. Commissioners for the care of the school lands were to be appointed by the county courts, five for each county by the law of 1820, and two for each township by the law of 1822, and they were authorized to build schoolhouses, as needed, when the funds would permit. In 1824 the first real school law was enacted. This made each township a school district; school boards of five were created to build or to rent schoolhouses, employ a teacher, appoint school visitors, and to make rules and regulations; and, on demand of two thirds of the voters, the boards were to levy a tax for the desired term. Little was done under this law. In 1835 the law relating to schools was revised. Three trustees were to be elected for each township; some of the powers of supervision were taken from the school visitors and given to the trustees; and biennial reports were to be made to the county courts. A "Committee for Literary Purposes," virtually a State Board of Education, was also created, to consist of the Governor, Auditor, Treasurer, and Attorney-General. In 1839 a new revision of the school law was made, the office of State Superintendent of Common Schools was created, county commissioners and township inspectors were provided for, and a three months' school term was required. The office of State Superintendent was abandoned two years later, however, and the Secretary of State again received such reports as were made, acting *ex officio*. The census of 1840 showed that most schools were still private, there being but 642 primary schools in the state, St. Louis included, and but 526 pupils educated wholly on the public charge. In 1842 only 28 of the 77 counties then organized had schools. By 1850 there were 1570 public schools, though nearly one half of the income still came from tuition fees. In 1844 the state university, provided for in the constitution of 1820, was opened; but it had a very struggling existence until after 1853.

In 1853 the office of State Superintendent of Schools was reestablished, and the first public high school in Missouri was opened in St. Louis. In 1855 a revised school law was enacted. This law created the office of county school commissioner, and made a number of improvements in the system. By 1858 every county had been organized into the public school system. By 1861 there were 5670

teachers employed, and the expenses of the schools were about \$850,000, one fourth of which came from rate bills. The coming of the war put an end to this school system, and the legislature of 1861 abolished the office of State Superintendent, and suspended the school appropriation. During the war the schools of the state were virtually closed, and the office of State Superintendent of Schools was not reestablished until 1865. The public school system of Missouri really dates from after the Civil War.

A new constitution was adopted in 1865, which made a much more detailed provision for the creation of a state school system. Separate schools for the colored race were permitted, but the apportionment of school money was to be made without regard to race or color. The State Board of Education was continued, and a Superintendent of Public Schools was provided for. The maintenance of the state university was made mandatory. A three-months' term was required, and permission was given to enact a compulsory education law. The school funds were safeguarded; the investment of the principal narrowly limited; and a state tax, and apportionments to equalize inequalities, were permitted. The new school law of 1866 carried these provisions into effect. Separate schools were permitted, if twenty or more colored children were in any district. The township, while still nominally remaining the school district, was in reality abandoned for the Iowa plan of subdistricts, with three directors for each, thus virtually introducing the district system. County superintendents, elected for two-year terms, were provided, and given the full functions of a county superintendent. Cities were permitted to organize under boards of education of six, with the usual powers. This school system lasted ten years, when it was superseded by a third constitution and a new school law. In 1870 two state normal schools were established for white teachers (Warrensburg, opened in 1871; and Kirksville, established privately in 1867, and adopted by the state in 1872), and one for colored teachers (Lincoln Institute, at Jefferson City). In 1874 a third school for white teachers was authorized at Cape Girardeau. In 1874 the first textbook law was enacted, providing for county uniformity, the presidents of the district school boards of the county constituting a textbook commission.

In 1875 the constitution adopted at the close of the war was abandoned, and a new one, under which the state has since been governed, was substituted. Most of the provisions of the constitution of 1865 were retained, though the statements in the new constitution were in some cases less forceful and less emphatic. This constitution of 1875 and the laws following form the basis of the present Missouri school system.

Since 1875 four periods in Missouri education stand out. From 1875 to 1883, under the administration of Superintendent Shannon, was a period of material organization, and the maintenance of a system of public education was changed from a questionable undertaking to a settled public policy. From 1883 to 1891, under Superintendent Coleman, and following the period of organization, came a period of agitation for careful work in the fundamentals of elementary education, and for perfection in classroom management. The only legislation of any importance during this period was the repeal of the county textbook law in 1885, leaving the state under district adoption until 1891; the amendment to the constitution in 1887, changing the percentage of state revenue which must be appropriated to education from one fourth to one third; the lengthening of the school term from four to six months in 1889, if a tax levy of forty cents on the \$100 would permit of it; and the enactment of a permissive county superintendency law in 1889, permitting any county so desiring to vote to employ a county superintendent. But nine counties had provided county superintendents as late as 1903.

From 1891 to 1899, under Superintendents Wolfe and Kirk, was a period of agitation for a better school system and a broader outlook in education, and a period of struggle against the extreme conservatism of the state in educational matters. The legislation during this period was rather meager, and centered around textbooks and the training and certification of teachers. In 1891, after six years of district adoption of textbooks, state uniformity in textbooks was substituted. An Institute Board of Examiners now superseded the county commissioners, in the matter of certifying teachers; three grades of teachers' certificates were issued, and teachers were certified after two weeks' attendance at the summer county institute. Two years later the training school for institute conductors was abolished, and a new law rigidly fixed the weekly wages to be paid institute conductors and instructors. The same year the State Reading Circle, which had existed from 1884 to 1887, was revived and made effective. In 1899 the teachers' certification law was again revised; a graded series of certificates provided for, which materially raised the standard; uniform questions for the state were to be supplied, and the certification of teachers after a two weeks' summer institute was abandoned. The development of high schools was stimulated during this period, and the state university, for the first time, began to receive some real recognition.

Beginning with 1900, under the administration of Superintendents Carrington and Gass, the state has experienced an educational awakening before unknown. This last period has been essentially one of reconstruction and unification, and marked educational progress

has been made. In 1901 a state library law was enacted, and a State Library Commission, consisting of the State Superintendent and four appointed by the State Board of Education, was created. County boards of education, consisting of the county school commissioner, one appointed by the county court, and one appointed by the State Board of Education, were also created, and given some powers of supervision. They were authorized to supervise and grade the rural schools, to issue a county course of study, to renew teachers' certificates, and to approve summer schools. The consolidation of school districts was first authorized in 1901, also. In 1902 the people approved a constitutional amendment to extend and renew the state's Certificates of Indebtedness to the School Fund, and the discussion preceding the election brought out clearly the necessity for more revenue for schools. In 1903 the summer county institute law was repealed, a three days' county teachers' association in the autumn was substituted, and attendance for ten to twelve weeks in an approved summer normal school was substituted for the two weeks at the summer county institute. The State Superintendent was authorized also to inspect and classify the high schools of the state. In 1904 a constitutional amendment, providing a five cents additional tax, to be distributed to the school districts and to be used in supplying free textbooks and supplies, was defeated. In 1905 the state textbook law, enacted in 1891, and under discussion ever since, was entirely repealed, and county adoptions once more substituted; two new normal schools were established, at Springfield and Marysville, both of which were opened the next year; and the first compulsory education law was enacted. In 1907 the school law was revised and a number of changes made. The State Library Board was changed to its present form; state inspectors of high schools and of county schools were provided; the school term was increased from six to eight months, if a forty cent tax will provide the necessary funds; districts having less than twenty-five children were authorized to close their schools and transport their children; orphans, half orphans, and dependent children were to be educated free in any district; boards were permitted to employ superintendents for two years instead of for one; and St. Louis was permitted to require pupils to attend the whole time the schools were in session. In 1909 the compulsory education law was amended to require attendance, outside of St. Louis, for three fourths of the time the schools are in session, and boards in towns of 1000 or over were authorized to appoint attendance officers. Also in 1909, after thirty years of agitation, a county supervision law was enacted and made mandatory for all counties, with state aid of \$400 toward the salary of each county superintendent; all state aid to districts not

providing \$350 was cut off, unless they raised a tax of forty cents; special state aid to poor and weak school districts was granted, under certain restrictions; night schools, and an eleven-month term in cities, for physical training, were both permitted; and a state industrial home for negro girls was established. In addition, the school laws applicable to all schools (Section I) and to common schools (Section II) were thoroughly revised. In 1911 the child labor law was extended to all cities of 5000 inhabitants or over; the certification bill was revised so as to give the State Superintendent the supervision of all certification; and the method of apportioning school funds was revised so as to substitute a combined teacher and attendance basis for the old census basis.

Present School System. — At the head of the school system is a State Board of Education and a State Superintendent of Public Instruction. The State Board is an *ex officio* body, and consists of the State Superintendent as President, the Governor, Secretary of State, and the Attorney-General. This board has nominal supervision of the educational interests of the state, but its real work is the investment of the school funds and the sale and preservation of the school lands. The Superintendent of Public Instruction is elected by the people for four-year terms. He is also charged with the supervision of the schools and the school funds of the state; confers and advises with county school officers; may visit and inspect schools; prepares all questions for the examination of teachers; has general supervision of all examinations, and the grading of the answers; issues state certificates, valid anywhere in the state; receives annual reports from all school officers and state institutions; and makes an annual report to the Governor. There is an Inspector of High Schools, who assists in classifying and prescribing courses for the high schools, and an Inspector of Common Schools, who assists in their examination and approval.

Below the State Superintendent is a county superintendent for each county, the county boards of education having been abolished by the county superintendency law of 1909. The county superintendents are elected by the people in district school meetings for four-year terms; must have taught two years in the preceding four, or have spent the preceding two years in a college or normal school; and, in addition, must hold a college or normal diploma, a life state certificate, or a first-grade county certificate. The county superintendent has general supervision of the schools of the county, except in the case of cities, towns, or villages employing a superintendent, with at least half his time free for supervision. The Superintendent must visit each school yearly; supervise the work and the accounts of the district officers; issue a course of study; adopt a plan

of grading for the schools; arrange for examinations and for graduation from the district schools; hold six public meetings each year, at different points in the country, to instruct and to advise; hold a county teachers' institute in the autumn; and must follow the instructions of the State Superintendent and make an annual report to him. An especially meritorious provision of the law is one requiring each county superintendent to spend five days each year at a convention of school superintendents, and twenty days each year in the state university, a state normal school, or in a manner approved by the State Superintendent, and in the study of rural school problems and school supervision. The salary for the office ranges from \$700 to \$1500, and of this the state pays \$400, in each case. County uniformity in textbooks is secured by the county textbook commissions, consisting of the county superintendent and two teachers, one appointed by the county court and one by the State Board of Education. Cities of 100,000 or over and accredited high schools may select their own books. This commission adopts books for five-year periods, from a printed list of registered books supplied by the State Superintendent. Publishers have to be properly licensed to sell, and books and prices must be on file. Supplemental books are not included. Indigent pupils may be supplied with books free.

Below the county are four classes of school districts: (1) common, with three school directors, elected in annual school meetings; (2) consolidated school districts, with boards of six directors; (3) town school districts in towns, villages, and cities of the fourth class, with boards of six school directors; and (4) cities of the first, second, and third class, under boards of education and special laws. The township unit is permissible, but is little used.

Each common school district holds an annual meeting, at which vacancies are filled, and one school director is elected, for a three-year term. The board of trustees then organizes by electing one of their number as clerk, who then performs most of the functions assigned to the board. The school meeting may also vote to lengthen the term beyond eight months; may vote a tax in excess of forty cents, or a tax for buildings or equipment; may decide changes in boundaries, or site; may direct the sale of property, and vote on allowing the school-houses to be used for specified purposes; and once in four years designates its choice for county superintendent. City, town, and consolidated districts may select a secretary and a treasurer, not members of the board; may establish graded schools, high schools, and libraries, as needed; and must maintain a term of at least eight months. Consolidated districts may be formed of three or more contiguous common school districts, or a vil-

lage and two adjacent districts, and may maintain elementary and high schools. Any district which provides less than eight months' school, if a tax of forty cents will provide it, forfeits its organization. School boards in all classes of districts may borrow, by vote of the district, up to 5 per cent of their assessed valuation; may make rules and regulations for the government of their schools; admit and suspend pupils; require a medical examination of any pupil; contract with teachers; have an annual school census taken; condemn sites; estimate funds needed; maintain separate schools for the two races, establish a negro school whenever there are fifteen negro children in the district, and provide equal privileges and terms for each race; and make an annual report to the county superintendent and to the county clerk. The latter reports all statistics to the State Superintendent.

School Support.—Missouri, on its admission as a state, received two townships of land for a university; the sixteenth section in every township for common schools; and seventy-two sections of saline lands for schools,—the sixteenth-section lands being given to the state for the benefit of the townships. The sixteenth-section grants amounted to 1,199,139 acres. In 1837 the saline land fund, together with the Surplus Revenue fund (\$382,335) then received, was constituted a permanent state school fund. To this was added the money received from the sale of the State Tobacco Warehouse (\$132,000) in 1865. This fund now amounts to \$3,159,281, and yields an income of about seventeen and a half cents per pupil per year. The one third of the state revenue added raises the amount to about \$1 80, the amount having risen rapidly with the recent increase in wealth in the state. The swamp-land grants of 1849 Missouri put into a series of county school funds, to which have been added the proceeds of fines, forfeitures, and the sale of estrays. These funds now amount to \$5,750,000. The sixteenth-section township funds amount to a total of approximately \$4,000,000. Both the county and the township funds vary greatly in amount, being from ten to thirty times as large in some counties as in others, and produce very unequal incomes per pupil in the different counties and townships. The income from all school funds must be used only for teachers' wages.

The largest proportion of the money for support comes from local taxation, which may go to sixty cents on the \$100 in cities and to forty cents elsewhere, and may exceed these limits by a vote of the people. A tax of forty cents must be levied, if necessary to provide an eight months' school. If a tax of forty cents will not provide sufficient funds, with a salary of \$40 a month to the teacher, to provide an eight months' school, the State Treasurer will add an amount sufficient, provided the district is not less than nine square miles in

MISSOURI, STATE OF

area, has an assessed valuation of \$40,000 or more, a school census of twenty-five, and has levied a tax of forty cents for the teachers' fund and twenty-five cents for incidental expenses. Such aid cost the state \$13,078 in 1910. All other school money was distributed on census up to 1911, but thereafter all state money is to be apportioned on the combined basis of teachers employed and aggregate days' attendance. The total cost of the school system in 1910 was about \$13,000,000, or about \$3.97 per capita of the total population.

Educational Conditions.— Aside from two large cities and a few smaller ones, which contain 30.8 per cent of the total population (St. Louis and Kansas City contain 28.1 per cent), 57.5 per cent of the people live in rural districts. Of the total population, 95.2 per cent are white and 4.8 per cent negro, while 93 per cent are native born, and about 5 per cent are illiterate. Of the foreign born a little over one half are Germans. The state has many small schools, and very unequal educational conditions in the different parts of the state. Not much headway has as yet been made in the matter of the consolidation of school districts, or in the provision of school libraries. The compulsory education law requires the attendance of children, eight to fourteen, for only three fourths of the time the public schools are in session, and the same for employed children, fourteen to sixteen, unless excused for a number of statutory reasons. Cities and towns of 1000 population may appoint attendance officers, who may enforce attendance and visit factories. Cities of 10,000 or over may establish parental schools. Children, eight to fourteen, cannot be employed in any mine, factory,

MISSOURI, STATE OF

or shop during school hours, unless possessed of a certificate showing attendance at school for three fourths of the school term. City school authorities may contract with homes established for the care of delinquent, dependent, or neglected children, for their care and training. Children who are orphans or half orphans, or dependent, may receive free schooling in any district where they find either a temporary or a permanent home.

Teachers and Training.— The state employed approximately 19,000 teachers in 1911, about one fourth of whom were men. For the training of new teachers, the state maintains five normal schools for whites and one for the colored race. The city of St. Louis also maintains an institution for the training of teachers for the city. All of the state normal schools (five for whites and one for colored students) and the state university maintain summer sessions. Three grades of certificates are issued, these being arranged in a graded series. The questions are furnished by the State Superintendent, and are uniform throughout the state. The county superintendents act as agents in giving the examinations, and certify the professional grade of the candidate, but the State Superintendent has oversight of the grading of the papers and the granting of the certificates to teach. Certificates may be renewed. County institutes are to be held in each county, and ten or more are to be provided in the state for colored teachers. Cities of 300,000 (St. Louis) examine their own teachers and conduct their own institutes. Grades made in approved summer schools may be accepted in lieu of examinations in the subjects covered.

Secondary and Higher Education.—The development of secondary schools in the state has been rapid during the past decade. Many small and short-term schools have been developed, and put on the accredited list. Four hundred nineteen high schools were reported in 1910, about one half of which were classified as first grade. Any city, town, or consolidated district may establish a high school, and any four or more common school districts may unite to form a joint high school, if approved by the people. In the latter case, 20 per cent of the teachers' fund may be used for high school purposes. Teachers in high schools must hold a first grade county or a state professional certificate.

Higher Education.—The University of Missouri, at Columbia (*q.v.*), stands as the culmination of the system of public education of the state. The agricultural college is combined with the university at Columbia, but the school of mines is located at Rolla. The university is assisted in the work of higher education in the state by the institutions as shown on page 275.

Many of the above are small and struggling institutions, and nearly all of them were founded before the state university began to receive real support from the state.

Special Education.—The state also maintains the Missouri Training School for Boys and Girls, at Booneville; the State Industrial Home for Girls, at Chillicothe (both reformatory); the Missouri School for the Blind, at St. Louis; the Missouri School for the Deaf, at Fulton; and the Missouri Colony for Feeble-Minded and Epileptics, at Marshall. MISSOURI, UNIVERSITY OF, COLUMBIA AND ROLLA, MO.—A coeducational institution, forming part of the public school system of the state of Missouri, founded in 1839. The present organization, with two colleges (Arts and Science, and Agriculture) and schools for professional and graduate work, was adopted in 1909. The separate divisions, each of which was in some form differentiated from the rest of the institution in the year indicated, are: College of Arts and Science (1839); School of Education (1867);

College of Agriculture (1870); School of Mines and Metallurgy at Rolla (1870); School of Law (1872); School of Medicine (1873); School of Engineering (1877); Graduate School (1896); School of Journalism (1906). Special minor divisions are the Extension Division, the Summer Session, the Agricultural Experiment Station, the Engineering Experiment Station, the Mining Experiment Station, and the Military Department. All of these divisions are located at Columbia, with the exception of the School of Mines and Metallurgy and the Mining Experiment Station, which are situated at Rolla.

The entrance requirements are fifteen units for the College of Arts and Science, the School of Mines, and the College of Agriculture; and in addition two years of college work for all the other schools. These requirements, which are on the certificate basis, have been strictly administered, and this policy has stimulated and built up an excellent system of secondary schools in the state. The institution was one of the first four state universities admitted to the benefits of the Carnegie Foundation.

The final control over the institution is vested in the Board of Curators, which is appointed by the Governor of the state and is granted large powers by the state constitution. The internal organization is based on a general university faculty of all teachers of the rank of assistant professor and above, and special faculties for the various divisions. The university faculty assumes an unusually large degree of responsibility, and to it report many of the committees that in similar institutions report to the board of control.

The university holds the distinction of establishing the first school of education in a state institution, and of establishing the first school of journalism in the world.

The institution has a productive endowment fund of \$1,258,839, and receives the income of a 5 per cent state tax on collateral inheritances. Almost one third of its income is derived from the general revenues of the state by legislative appropriations. A movement to give the university other permanent support as a substitute for legislative appropriations has been under way for several years, but so far has not been successful. The receipts from fees are insignificant. The total income for 1911 was \$875,000. The enrollment of students for 1911-1912 was 3063. Albert Ross Ilihl, LL.D., is the president. C. A.

MISSOURI VALLEY COLLEGE, MARSHALL, MO.—A coeducational institution chartered in 1881 and opened in 1889 under the charge of the Presbyterian Church of Missouri. An academy, a college, and a school of music are maintained. The entrance requirements are sixteen units. Studies are divided into required subjects and classical, modern language, and science courses leading

to the A.B. and B.S. The enrollment in 1911-1912 was 105 students in the college proper. There are fourteen members on the faculty.

MISSOURI WESLEYAN COLLEGE, CAMERON, MO. — A coeducational institution established in 1883 as the Cameron Institute and incorporated under its present title in 1897, under the control of the Methodist Episcopal Church. Collegiate, academic, normal, commercial, and music departments are maintained. Students are admitted to the college on completing a high school course. The degrees of A.B., B.S., and B.S. in Civil Engineering, are conferred. The enrollment in 1910-1911 was 275. The teaching staff numbers nineteen members.

MISTRESS, SCHOOL. — See **TEACHERS, SEX OF.**

MITCHELL, MARIA (1818-1889). — Professor of astronomy and advocate of the higher education of women. She was educated by her father and in the private school of Cyrus Pierce (*q.v.*). She discovered a new comet in 1847, was for several years engaged in astronomical work for the United States Coast Survey, and was professor of astronomy at Vassar College from 1865 to 1880. She was the first woman elected to membership in the American Academy of Arts and Science and the American Association for the Advancement of Science. She served as one of the editors of *American Nautical Almanac*, and published several papers on scientific subjects and the question of the higher education of women. W. S. M.

MITTELSCHULE; MIDDLE SCHOOL. — A term which in Austria and Southern Germany is applied to those schools which are intermediate between the elementary schools and *höhere Schulen*. In Prussia and the states whose systems are modeled on Prussia, a *Mittelschule* is a type of school which furnishes a higher elementary education preparatory to the higher artisan occupations and the lower commercial and administrative positions. It is accordingly intermediate between elementary and secondary schools. This type of school originated toward the end of the eighteenth century, and has been known under many different names (e.g. *höhere Bürgerschule, Stadtschule, gehobene Bürgerschule, Rektorschule*, etc.). It was not officially recognized until the General Regulations of 1872, but even then it was not definitely organized, so that several types existed: (1) attached to an elementary school, (2) a separate school with five or six classes taking pupils from elementary schools, (3) a separate school with nine classes. The middle school is established and maintained entirely by local efforts, and receives no grants from the

government. Hence the curriculum can be adapted to meet local needs. The only restriction until recently was that the teacher employed in such schools must have passed the *Mittelschullehrerprüfung* or else an examination for higher school teachers. In 1910 the middle schools were reorganized; the complete school of this type must have nine classes, but pupils may enter into the sixth class (Class I is the highest) from the elementary schools; the curriculum has been defined; and, most important, such schools may prepare for the secondary schools. Up to the present the progress of the middle schools has been retarded because, although they charged fees and kept pupils as long as the *Realschule*, graduation carried no privileges, and pupils could not be transferred to secondary schools. The recent regulations remedy this. See further details under **GERMANY, EDUCATION IN.**

The term is not used in English to refer to any type of school, although it has been employed with reference to secondary education by Chancellor Elmer E. Brown in *The Making of our Middle Schools*, which deals with that type of education which is midway between elementary and university. In Ireland secondary schools and education are known as intermediate, although here pupils may be received from the age of nine on and the elementary branches may be taught.

MIXED NUMBER. — A number in which the sum of an integer and a fraction is expressed. For example, $2\frac{1}{2}$ is a mixed number. The term has generally been applied to the case in which the fraction is a common fraction; but there is no reason why this limitation should not be removed. The term is merely one of convenience in the school, and aside from its value in distinguishing the various cases that it is thought best to take up in fractions, it might well drop out of the vocabulary. The operations with mixed numbers are sufficiently treated in any common arithmetic. D. E. S.

MNEMONIC SYSTEMS. — Artificial devices for memorizing depending upon the creation of arbitrary associations. Every one at times deliberately associates some fact to be remembered with some more well-known fact, as in the case of fixing the memory of the name of a person which it has been found difficult to remember. A device of this sort which is a little more elaborate is the verse commonly used for remembering the number of days in the various months, beginning "Thirty days hath September." The early logicians made use of many such aids to memory in connec-

tion with the methods of syllogistic reasoning. Thus, the syllogistic moods were indicated by the vowels of the words of the barbarous Latin verses:—

Barbara, Celarent, Darii, Ferio, Baralipon
Celantes, Dabitis, Fapesmo, Frisesomorum,
Cesare, Camestres, Festino, Baroko, Darapti,
Fellepton, Disamis, Datisi, Bokardo, Fersoon.

More modern mnemonic systems apply the same principle in a more general way by the use of the figure alphabet, which is committed to memory. The one most frequently used is as follows:—

1	2	3	4	5	6	7	8	9	0
t	n	m	r	l	sh	g	f	b	s
d					j	k	v	p	c
					ch	c			z

"To briefly show its use, suppose it is desired to fix '1142 feet in a second,' as the velocity of sound: t, t, r, n are the letters and order required. Fill up with vowels forming a phrase like 'tight run,' and connect it by some such flight of the imagination as that if a man tried to keep up with the velocity of sound he would have a tight run." (E. Pick, *Memory and its Doctors*, p. 8.)

Two chief objections have been brought against the use of such systems. In the first place, they are either so limited in their application or so cumbersome as to defeat their purpose. And in the second place they are purely mechanical, and thus tend to discourage logical memorizing, which is not only more useful, but has been shown experimentally to be more economical than the mechanical methods.

MOB PSYCHOLOGY.—A special type of behavior and mental activity is exhibited by groups of persons who come together under the influence of any strong emotional excitement. Thus a community aroused by some crime is likely to behave in a fashion entirely different from any individual member of the community. The behavior of the company as a whole is characterized by lack of deliberation and lack of a feeling of responsibility. Imitation undoubtedly plays a very large part in mob behavior and in mob consciousness.

The imitation here involved is likely to be relatively blind. The whole situation can be described by saying that the emotional tension is raised to a very high level, and the action which proceeds from the company as a whole is intense to a degree which would be impossible in a single individual, even if he were dominated by the same emotion. Some writers on social psychology have been led to regard the behavior of a mob as typical of all social consciousness. Emphasis should be laid upon the fact that mob behavior is distinctly characterized by emotional tension. There are many other forms of social behavior which depend upon common ideals and common plans, but are not dominated by emotional stress. General interpretation of social phenomena on the analogy of mob behavior is therefore not justifiable. C. H. J.

MODE.—See GRAPHIC CURVE; STATISTICAL METHOD.

MODEL LESSON.—In the training of teachers it is customary to illustrate the principles of teaching by the use of actual classroom instruction. For this reason, most normal or training schools for teachers are equipped with a special laboratory school with carefully selected teachers in charge. When there is but one such school, it provides opportunity for (1) demonstration, (2) practice, and (3) experimental teaching. In the teaching of pedagogical theory, the demonstration school is an important and necessary adjunct to reading and discussion. The critic or class teachers of the observation or model school teach before the class in theory to illustrate the various types of teaching employed in current practice. The students report their observations and discuss them, thus gaining a more concrete basis for their theoretic study. The use of model or type lessons is vastly superior to random observations by students, for they can be given for the particular purpose and at the specific time required by the instructor in pedagogical theory. H. S.

See ILLUSTRATIVE LESSON.

MODEL SCHOOL.—A term commonly applied to a graded school connected with a normal school, or teachers' training college. The school may be used as a real model school, and little or no practice teaching or

experimental work be done in it, or it may be used as a regular training school, in which student teachers teach under direction. The term is rather loosely used. Strictly speaking, it should be used only for such schools as are models or types, serving mainly for observational purposes, the terms training school or practice school or experimental school being used for schools serving primarily for practice teaching purposes. See EXPERIMENTAL SCHOOL; NORMAL SCHOOL.

In Ireland the term "model school" is used to refer to a type of higher elementary school. The model schools when established by the Board of Commissioners of National Education aimed "to promote 'united education,' to exhibit the most improved methods of literary and scientific instruction for the surrounding schools, and to train young persons for the office of teacher" in the national schools. It was proposed to establish one in each of the thirty-two school districts, but this was never carried through. The first model school was opened in 1849. A higher education is given than in the elementary schools, and the teachers receive a higher rate of pay. Although the term has been retained, many of these schools have long ceased to serve as models, and provide an education intermediate between the elementary and secondary schools for those pupils who cannot proceed to the latter.

MODELING. — In teaching geography in the elementary school, modeling in relief is used to fix the interpretations of flat maps. Clay, papier maché, and sand are among the materials used. Owing to its cheapness and its ready use, modeling on the sand table has been very popular among teachers. The value of such work has been the subject of considerable controversy. It has been opposed as an inaccurate mode of representing physical features, which necessarily leads to exaggeration and the fixing of false impressions. Those who favor it contend that it is merely a supplement, not a substitute for accurate map reading, its main value being found in its use as a psychological device for teaching children facts in an active and concrete way. MODENA, ROYAL UNIVERSITY OF. — See ITALY, EDUCATION IN.

MODERN LANGUAGE AND LITERATURE. — The modern languages as subjects of study in the higher institutions of learning

take as their province the culture both old and new of the foreign peoples as revealed in their languages and literatures. In the broadest acceptation of the term it is the study of philology. For a full discussion of this discipline, particularly with regard to modern tendencies and the development of scientific methods, see under Philology. Of close relation, also, is the article on Phonetics. This article is limited to a consideration of the scope and methods of the study of these languages and literatures in the universities and schools at the present and during the very recent past.

In Universities. — *Germany.* — The scientific study of Romance languages and English in the universities of Germany is but the natural outgrowth and broader application of the philological method that began to flourish in the early decades of the nineteenth century, and is associated with such names as Grimm, Wilhelm von Humboldt, Bopp, and others. There were few chairs established in the Romance field before 1850. Halle, Giessen, Bonn, are among the earliest. All the chairs for the study of English came in the last three decades, the earliest at Leipzig and Strassburg in 1873. At present there is, even in the largest German universities, only one chair for Romance and one for English philology. Here and there a *privat Dozent* gives lectures, and the plan of having foreign lektors, usually one French and one English, has also been quite generally adopted. Berlin boasts of two English lektors, one Italian, one Russian, one Dutch, and one lektor for the Scandinavian languages.

There is a widespread feeling in Germany that the modern language departments, especially in the larger institutions, are considerably undermanned to carry on the work satisfactorily and meet the practical demands that are becoming more and more imperative. Even if the professor keeps within the field of philology, to such an extent has it grown that it is impossible for one man to cover the ground satisfactorily to himself or to his students. The German *Neuphilolog* justly prides himself upon the thorough grounding he gives his students in scientific method, in historical grammar, and in the interpretation of the older texts. To accomplish this and yet add courses in Shakespeare, Molière, to say nothing of interpreting writers nearer our own times, in whose works there is so much of truly scholarly interest, must obviously soon bring about an increase in the modern language staff.

The scholarly work is in the hands of the professor, a law unto himself as regards the courses he offers during a semester or series of semesters. For more intensive work in method with advanced students, there have been established seminars. The kind of work done in the modern language seminars varies with the personality of the director.

The English seminar at Berlin under Professor A. Brandl is a very good example of the more modern type of organization. There are three rooms for books which now amount to over 11,000 volumes; one room for phonetic apparatus, a room for conversational practice, and various offices. The doors are open freely to all, but only the advanced students are regular members, allowed to take part in the work of the seminar. In the winter semester, 1909-1910, there were 290 using the seminar, and twenty-one regular members. In order to become a regular member it is necessary to pass an examination, or the applicant must prove to the lector that he has sufficient practical command of the language to omit the work demanded in the preliminary proseminar. Even entrance to the proseminar is safeguarded by a preliminary trial. The lector does the practical teaching of the departments. On the whole, his work is primarily planned to give students of the university an opportunity to hear the foreign language rather than a scholarly discussion of a limited field of knowledge. His lectures deal with modern literature, or serve to orient the student in the life and customs of the foreign peoples. He also usually offers some work for small groups of advanced students in composition and phonetics. How much the lector adds to the scholarly side of the departments concerned, depends upon his personality, training, and, doubtless, upon the attitude of the professor, as head of the department.

The following paragraph presents two types of courses. The first is very progressive. It takes cognizance of the practical as well as the more strictly philological side of the subject. Lectures in most courses are held in English by the professor as well as the lector. The second is a more typical offering of courses found in Germany. Great stress is laid upon historical grammar, syntax, and the interpretation of old texts. The modern authors are usually treated by the lector.

Courses offered in English at the University of Marburg during the summer semester of 1912: Introduction to the study of English Philology, two hours; Old English Literature, with readings, three hours; English Seminar, philological section: Shakespeare's *Hamlet*, one hour; Essays of Addison, one hour; English Seminar, practical section: Poetry of George Meredith, one hour; Proseminar, philological section. introduction to Old English (Prose), one hour; Practical Section: reading of Phonetic Text, one hour; England and the English (Part I), one hour; Introduction to spoken English, open to students of all faculties, two hours; Essays and Discussions, one hour.

Courses offered in the Romance Languages at the University of Göttingen during the summer semester of 1912: French Phonetics, two hours; Historical Italian Grammar, with interpretation of selections from Dante, Pe-

trarca, Boccaccio, four hours; Introduction to Old French with exercises in interpretation, two hours; Selected topics of French Syntax, two hours; Seminar, exercises in Old French (*Erec*), one hour; Proseminar, reading and interpretation of Racine's *Plaideurs*, one hour. The French lector gives the following courses: Modern French for beginners in two sections, two hours each; Modern French for advanced students, two hours; Alfred de Musset, two hours. Italian lector offers: Introduction to the study of Italian, four hours; *Le Novelle della Pescara* by Gabriele d'Annunzio, reading and composition for advanced students, one hour; Italy and its People, illustrated lectures for students of all faculties, one hour. Spanish courses: Elementary course, two hours; *Doña Perfecta*, novela de Pérez Galdós, reading and composition, for advanced students.

France. — In a number of the provincial universities there is still only one professorship of modern languages. Others have one professor of English or German, the work of the second language being in charge of men of non-professional rank, variously named *maître de courses*, *maître de conférences*, *chargé de conférences*. Only in the larger universities like those of Paris, Lille, and Poitiers do we find separate chairs for German and English. Two or three others have one full and one adjunct professor. All, however, have teachers of the modern languages usually for both German and English, and sometimes for Russian, Italian, etc. Here and there, the German system of having lektors, native Germans and Englishmen, seems to have found favor. This, however, is not at all general.

The young man or woman who has passed the French *baccalauréat* and who wishes to specialize in modern languages has a very definite course of study to pursue in order to obtain, through public examination, the various diplomas granted by the State. The chief state diplomas are the (1) *Licence*, (2) *Diplôme d'études supérieures*, (3) *Doctorat ès lettres*. In addition to these diplomas there are, among others, competitive examinations for the *certificat d'aptitude* and the *agrégation*. The work, including the reading, demanded for these several diplomas is pretty definitely prescribed, and the courses offered in the universities are planned, very largely, to prepare students to meet the requirements. There is, consequently, great similarity in the offerings of all the universities, in marked contrast to the lack of uniformity of courses given in the various German universities. In the preparation for the advanced examinations, however, the student must evidently largely depend upon himself, the university professors and courses serving merely as guides. The candidate is also doubtless aided by the full accounts of all examinations that are found in educational journals.

The *licence* can be obtained after one year's study beyond the passing of the baccalaureate. As a rule, a longer time is necessary to prepare for this diploma. The prescribed work in modern languages is narrow in scope, with the chief emphasis upon a few books that are representative of different periods of literature. The examination is both oral and written. In addition to the general three-hour Latin examination required of all arts students, the candidate specializing in modern languages passes: (A) written tests in: (1) Translation and grammatical commentary, modern language, chosen by the candidate. Commentary written in the modern language, four hours. (2) Modern language theme, three hours. (3) French essay, four hours. (B) oral tests in: (1) Interpretation of a modern language text, together with a literary and grammatical commentary in the foreign language; (2) literary history of the modern language; (3) interpretation of a text from modern French literature; (4) any university course, at the choice of the candidate; (5) translation of an easy selection from the second modern language chosen by the candidate. About on a par with the *licence* are the competitive examinations for certificate of proficiency for modern language teaching in the various state schools.

Great stress is laid upon the candidate's ability to speak and write the foreign language, and it is usual to spend a year abroad before attending the regular university courses.

The English books chosen for 1913 for the modern language certificate for teaching in normal schools are: Sheridan, *The School for Scandal*; G. Eliot, *Adam Bede*; Kipling, *The First Jungle Book*; Wordsworth, *Michael, a Pastoral Poem*; Keats, *Isabella*; Tennyson, *The Miller's Daughter*, *The Brook*, *Dora*, *Morte d'Arthur*, *Ulysses*, *The Revenge*; Browning, *The Pied Piper of Hamelin*, *Hervé Riel*, *How they brought the Good News from Ghent to Aix*; Whittier, *Maud Muller*.

The Diploma of Higher Study can be obtained after two years at the university. It is the intermediate stage between the *licence* and the competitive *agrégation*. Greater specialization in the chosen field characterizes the work for this diploma. The candidate must prepare and defend a memoir written either in French or in the language the student offers. The examination also includes the grammatical and literary interpretation of passages from authors of the Middle Ages, Renaissance, and Modern periods, previously chosen by the candidate.

A much-coveted state diploma is the *agrégation*, which carries with it the right to a position in a Lycée, or college. The *agrégé* is the highly trained specialist in his own particular field. The Ecole Normale at Paris, now the professional school of pedagogy of the University of Paris, is closely associated with the name

agrégation. The competitive examination is, however, open to all those who possess the prerequisite training. It requires at least three years beyond the baccalaureate to pass the *agrégation*. As only a certain number can pass each year, depending on the demand for teachers of this grade, even good candidates try four or five times before meeting with success. The work in preparation for the *agrégation* is pretty definitely outlined, and, to a certain extent, the courses given at the university meet the needs of candidates. Practice teaching in a Lycée, and special classes at the Ecole Normale supplement the regular university courses in subject matter. Independent work under supervision occupies the better portion of the student's time, particularly at the later stages of preparation.

In addition to the teaching qualifications the written requirements are:— (1) An essay in French on some topic dealing with the literary history of the foreign people, seven hours; (2) essay in the foreign language dealing with the history of civilization of the foreign people, seven hours; (3) translation from and into the foreign language, two papers, four hours each. The oral test includes a lesson given in French and one in the foreign language after five hours' preparation, three quarters of an hour; a half-hour test of the candidate's practical knowledge of the spoken language.

The books chosen for 1912 upon which the various papers are set are:—

I. The vision and the dream in English literature. Chaucer, *The House of Fame*, Books I and II. Shakespeare, *A Midsummer Night's Dream*. Macpherson's Ossian, *Fingal*, *Carthou*, *The Death of Cuchullin*. Byron, *The Dream*, *Darkness*, *The Vision of Judgment*. R. Kipling, *The Finest Story in the World* (Many Inventions), *The Brushwood Boy* (The Day's Work).

II. Biblical influence on English literature and society. Judith (Sweet's Anglo-Saxon Reader); The Revelation of St. John the Divine (Authorized version of 1611). Milton, *Paradise Lost*, Books VII and VIII. Bunyan, *The Pilgrim's Progress*. W. Hale White, *The Autobiography of Mark Rutherford*, *The Deliverance of Mark Rutherford*.

III. Criticism of contemporary English society. Carlyle, *Latter-day Pamphlets*. Ruskin, *Sesame and Lilies*. Chesterton, *Orthodoxy*. Galsworthy, *The Island Pharisees*. As examples of the topics set at the oral examination of the English *agrégation* for 1911: French lessons: Treatment of Nature in *The Tempest*; The humor of Wells. English lessons: comment on the versification of the *Knight's Tale*, line 1363 to line 1439; the manners of the Restoration as illustrated by the *Way of the World*.

There is a state *Doctorat ès lettres* and one primarily for foreign students granted by the University. The state diploma is usually

taken several years after the *licence* or even the *agrégation*. Two theses are required, one in French and the other either in French or the foreign language. They are mature and scholarly contributions to the subject, corresponding to the doctors' dissertations accepted by the best American universities. To gain the University diploma requires four semesters' enrollment and a thesis either in French or Latin. There is, in addition to the public defense of the dissertation, an examination on university courses.

The following German courses were offered at the University of Paris during the year 1911-1912: Language and Literature. M. Andler, Professor, director of studies. Public Course: Intellectual geography of Germany in the nineteenth century, one hour. Conferences: (1) Historical syntax of modern German, one hour; (2) exercises in syntax in preparation for the *licence* and the *certificat d'aptitude*, one hour; (3) consultation with students, one hour. Reception of students of modern languages, one hour. M. Lichtenberger, Adjunct Professor. Conferences: (1) History of the German language, one hour; the legend of the Grail, one hour; (2) explanation of texts of Middle High German, one hour; (3) lessons in preparation for the *agrégation*, one hour. M. Rouge, Maître de Conférences. Conferences: (1) Heinrich von Kleist, one hour; (2) correction of work and explanation of texts, one hour; (3) exercises in preparation for the *licence*, one hour. M. Basch, Chargé de Cours. Conferences: (1) Religious and moral philosophy of German Romanticism, one hour; (2) practical exercises, one hour; (3) history of German literature in the eighteenth century, one hour.

England. — Work in modern languages in the older universities of Oxford and Cambridge is, on the whole, but a generation old. To be sure, as early as 1778 Sir Robert Taylor bequeathed £189,000 to the University of Oxford for the establishment of an institution for the teaching of modern foreign languages. The Taylorian Institute, however, did not come into existence until 1845, and the first professor of modern European languages was chosen three years later. Max Müller succeeded the first incumbent, but after he became Corpus Professor of Comparative Philology in 1868, the professorship lapsed and Taylorian teachers of French, German, Italian, and Spanish were appointed instead. It was not until after the establishment of the honor school of modern languages that appointments were again made, one professor of German in 1907, and one of French in 1909. At present there are also a professor of Russian, about nine or ten lecturers or readers, and about an equal number of tutors and teachers connected with the Women's Colleges and Halls. Cambridge celebrated in 1909 the twenty-fifth anniversary of the founding of the Medieval and Modern

Languages Tripos, and in that same year appointed the first professor of German. At present there is a reader of French. Four lecturers also give instruction in modern languages exclusively, and a number of recognized women teachers.

The other modern English universities, such as London, Manchester, Liverpool, etc., have about the same strength and organization of teaching staff as the German universities. As the work in modern languages required for the pass and honor degrees in the various English universities does not differ essentially, a description of the status of modern languages at Cambridge will be given.

A Cambridge man may take a degree with no knowledge of a modern language at all. Since 1886, however, German and French form two of the three so-called additional subjects, one of which must be passed at the "previous examination" or entrance examination. As French is the language usually taken in the boys' schools fitting for college, there is a dearth of young men coming to the university well grounded in German. The percentage of young women that have had both languages is very much higher. Attempts to induce the authorities to allow German as a substitute for Greek have thus far failed. A certain amount of specialization in the modern languages may be done even by students who go in for the ordinary B.A. degree by preparing for the special examinations in English and German, or English and French. These examinations are comparatively easy and consist of translation and composition based upon prescribed books. Some of the work is voluntary. No oral examination is at present required. Candidates can, however, obtain recognition for their practical command of the foreign language by taking the oral test held for honor degree students. The prescribed books in French and German for 1911 were: French: Racine, *Athalie*; Marbot, *Mémoires*, vol 2, cc. 1-26; (voluntary) *Extraits de la Chanson de Roland*; Molière, *Les Femmes savantes*; Bossuet, *Oraisons funèbres*. German: Gutkow, *Zopf und Schwert*; Tieck, *Ein Dichterleben*; Fulda, *Der Talisman*; (voluntary) Hartmann von Aue, *Der Arme Heinrich*; Uhland, *Ernst von Schwaben*; Hebbel, *Agnes Bernauer*; Liliencron, *Anno 1870*.

Most students especially interested in modern languages prefer to go in for the Medieval and Modern Languages Tripos, corresponding to the Honor Schools at Oxford. As at present constituted, there are ten sections, six of which deal with the modern literatures of England, France, Germany, Italy, Spain, and Russia. Four emphasize older periods and philology. (English and Germanic, French and Romance, and German and Germanic.) A candidate for an honor degree in modern languages must pass in

any two of the above sections. It is possible for him, therefore, to do all his work in one language or divide his time between two, if he so desires. Other combinations can be made with subjects outside the modern language field, with history, the classics, etc. Both sections may be passed off at the end of the third year, or one may be taken at the end of the second and the other at the end of the third. The examination in the "German" section tests the candidate's ability to translate into the foreign tongue, to write a German essay on some topic bearing upon the literature, history, or institutions of Germany. There are papers on the general field of literature since 1500 and on some special modern period, and also on the history of the German language, the elements of historical German grammar, and on meter. The examination on the "Old German" section is more strictly philological in character and serves to test the candidate's knowledge of the language and literature previous to 1500. The courses given at both Oxford and Cambridge are in general plan of organization very similar to the modern language courses found in the various German universities. In recent years more attention has been given to the literary side of the field. The aim has, however, always been to make the work of the tripos as sound philologically as the time and conditions permit. The practical and modern side of the student's training must be obtained largely through residence abroad before or during the university course. An oral test now forms a regular part of the examination at both Oxford and Cambridge. But it is possible, at least at Cambridge, for one to pass the tripos without satisfying the examiners in the oral command of the language. In both places, however, the names of successful candidates in the *vive voce* test are especially distinguished in the published class lists. During the first twenty-five years since the establishment of the Medieval and Modern Languages Tripos, 567 took honor degrees in Modern Languages at Cambridge. Of these 230 were men, and 337 women.

The older English universities do not confer degrees taken in courses beyond that of B.A. But both Oxford and Cambridge offer opportunities for work to advanced and research students under certain conditions. The degree of M.A. in the University of London can be taken in the several modern languages and literatures by those who have already passed the B.A. honors examination. It is an examination in both language and literature and includes: (1) a thesis; (2) a written examination; (3) a *vive voce* examination, especially on the subject of the thesis. The written portion of the examination consists of general questions to be treated in the form of an essay and translation of texts chiefly chosen from early periods, with commentary. The following courses were offered at Cambridge during

the year 1911-1912. The foundations of modern German Literature, 1800-1850; Goethe's *Faust* I; Historical German Grammar; Modern German Seminar, Advanced German Composition; Old German Seminar, History of the German Language; Old High German; German Historical Grammar; Introduction to Middle High German Translation (with papers), Kudrun and Walther von der Vogelweide. Special subjects and books announced for the German section of the Modern Languages Tripos, Cambridge University, for 1912 are as follows: Paper (4) Walther von der Vogelweide. Das Niebelungenlied (Sammlung Göschen), pp. 27-99. Braune, Althochdeutsches Lesebuch, xvi, 7-11; xvii; xxx; xxxii, 10-12; xxxiii; xxxiv; xxxvi; Paper (5) (special subject): The historical drama in connection with Lessing, Goethe, Schiller, Kleist, Grillparzer, Uhland, Wildenbruch, Saar. Paper (6) Luther (Sammlung Göschen). Goethe: Poems, *Iphigenie*, *Faust*. Schiller: Poems of the third period, *Die Braut von Messina*. Uhland: Ballads. Consbruch und Klinkesiek, Deutsche Lyrik des neunzehnten Jahrhunderts.

Special subjects and books announced for the Old French and Provençal section, the Modern Languages Tripos, Cambridge University, for 1912. Paper (2) (special subject): French literature in the reigns of Louis VII, Philippe Auguste, and Louis VIII, in connection with Ailseans; Chrétien de Troyes: Lancelot; Guillaume de Dole; Aucassin et Nicolette; Villehardouin, La conquête de Constantinople; Le Mystère d'Adam. Bartsch et Horning, La langue et la littérature françaises depuis le IXème siècle jusqu'au XIVème siècle, pp. 101-394 and 399-408. Paper (4) Bertran de Born; Flamenca; Appel: Provenzalische Chrestomathie.

England. — The status of modern foreign languages in English schools of secondary grade is still in the making. Among the factors that have retarded their growth are: (1) Lack of any national system of public instruction before 1902; (2) The influence of the older Universities and Public Schools — strong bulwarks of classical training; (3) Until a few years ago, the over-emphasis of science and art subjects in non-endowed schools, in order to obtain State grants of money, and the consequent neglect of the humanities; (4) The attitude of the Board of Education towards modern languages, its insistence upon Latin as one of the two foreign languages taught in every school. In the most recent circular, however, it has taken a more liberal attitude and has yielded so far as to say that provision for the study of Latin need not be made in every school, but only in one out of every group of schools. The present ratio of pupils taking French to those taking German is about five to one. Since it is usually only possible for pupils to take two foreign languages of which Latin either must be, or almost invariably is, one, Ger-

man goes to the wall. Indeed many feel it is in a state of serious decline.

According to the *Report* on the conditions of modern language teaching presented in 1908 at the meeting of the Modern Language Association, the average age of pupils beginning French was 11; of 98 schools of the local type reporting, 74 began French first, 4 schools Latin, and 20 began the two languages simultaneously. German, if studied at all, is taken up at 14. This gives little time to the study of this language where the leaving age is 16 or 17. Four or five 45-minute lessons a week are quite usual for the foreign language.

The teaching has shown great improvement in recent years. In the past, particularly in the Public Schools and the numerous private schools, the scanty instruction was in the hands of a foreigner who was, far too often, treated as an outsider in the social scheme. Today there is an increasing number of men and women—trained at the universities or by study abroad—who have done much to put modern language work in a better strategic position. Within the past ten years or so, the principles of the German reform method have found many advocates. The Modern Language Association with its excellent organ *Modern Language Teaching* has been a powerful instrument in arousing apathetic official boards and in creating public interest in the cause, and particularly in thrusting out and adapting the so-called "direct method" to English conditions. Judging from the report of the committee referred to above, reform teaching has already made considerable headway especially in the elementary stages of instruction. The various university and other examining bodies that play such a rôle in English education have also begun to set papers more in keeping with modern aims of foreign language teaching.

For fuller discussion of this subject in the English schools, see PUBLIC SCHOOLS, ENGLISH; also GRAMMAR SCHOOLS.

United States.—Until the Revolutionary war, American colleges, as a rule, followed about the same course of study as was found in the universities of the mother country. Latin and Greek, Hebrew, some logic and philosophy, rhetoric, elementary mathematics, and physics were regarded as ample. French is recorded as an extra study about the middle of the century at Harvard. The program of senior study of 1756 at the Academy at Philadelphia (later the University of Pennsylvania), permitted French to be studied at leisure hours. The first professorship of French seems to have been established at the College of William and Mary in 1779, with the radical reorganization of the curriculum brought about by Thomas Jefferson. Students at Harvard, not preparing for the ministry, could substitute French for Hebrew in the 80's of the eighteenth century. But for a good many years the advance made by French and, later, German, in the colleges was ex-

tremely slow. It was an extra subject, occupying an inferior position in the same list as music, fencing, etc., to be paid for extra, and not permitted to interfere with the stated academic duties. George Ticknor was made Professor of French, Spanish, and Belles Lettres at Harvard in 1816. With his name is closely associated the term "elective system," which much later came to play such a rôle in the organization of the work of all higher education in America. The modern languages acted as the first entering wedge in the attempt at breaking up the rigid curriculum of the past. Ticknor organized his department on the elective basis, but his attempts to develop and extend the elective system met with severe opposition at every turn. In 1825 the University of Virginia opened its doors, and modern languages formed one of the ten schools comprised in the plan. In six months the modern language school was second in numbers after mathematics, and larger than the school of ancient languages. In the same year, due to the influence of Ticknor, Carl Follen was appointed Professor of German at Harvard. In 1828 Henry W. Longfellow began, as instructor at Bowdoin, to teach French, Spanish, Italian, and German, to members of any of the four classes who chose to elect the courses. The position of the modern languages in other colleges at the time is very similar.

Very little progress was again made for over a generation in modern language studies until, in fact, the idea of elective studies again rapidly spread during the period of the presidency of Charles W. Eliot at Harvard. At present, the modern languages are among the largest departments in the Colleges of Arts. The more important universities maintain large staffs of instructors. At such universities, for example, as Harvard, Columbia, Chicago, and Wisconsin there are twenty-five or more giving instruction in the Germanic and Romance departments.

At the present time many colleges demand a ready knowledge of French or German, or both, for the several degrees, although there is by no means uniformity except in colleges exclusively for women. As late as 1896-1897, of 432 institutions only 14 per cent required a modern language for the B.A. degree; of 123 institutions 41½ per cent required a modern language for the Bachelor of Philosophy, the modern language being in lieu of Greek. Similar percentages are shown in the requirements for the degrees of B.S. and B.L.

The present high school course usually equips the pupils with a knowledge of Latin and one modern language, French or German according to choice or environment. Large numbers, therefore, take as prescribed work in their freshman year, the modern foreign language required for the degree which they did not offer for entrance. This elementary work

in modern languages has become a great burden for the colleges to bear. Particularly in the smaller colleges there is neither time nor opportunity for the staff to offer much beyond what might well have been done in high school classes. Even in the larger universities the beginning classes contain a large percentage of the total number of students in the department.

Still, in a few colleges that require French or German, or both, for the B.A. degree, the student can prepare himself by private study if he so chooses. At Bryn Mawr, for example, five-hour courses throughout one year are provided, but until the junior year attendance is not obligatory, the student being free until then to complete the work by himself. Harvard also allows the student to pass off any deficiency in French or German before the opening of the second year in college.

For undergraduate students wishing to specialize in modern languages, there is given considerable range of opportunity in the large institutions of the country, either through the system of majors and minors, the group system, or honor degrees, etc. To obtain honors in Romance languages and literatures at Harvard, for example, the student "must have taken five courses in the department, only one of which may be of an elementary character. He must be able to read two of the Romance languages and to write one of them with readiness and correctness. He must present a thesis and pass an examination orally and in writing on the general field covered by the studies."

At the University of Chicago, the student interested in German must take, for the degree of Ph.B., "at least nine coherent and progressive majors (a major being a course which meets four or five hours weekly throughout one quarter year)."

At Bryn Mawr, the special work in modern languages must include two major courses of five hours a week for two years in any one of the fifty-five groups. By taking "any language with any language" the student is offered a wide field of choice. It is also possible to combine one foreign language with some other field, such as history or comparative literature, etc.

At Columbia, candidates for the A.B. degree who wish to specialize to a certain extent in German, for example, can elect this language as one of the two sequences required for graduation. They would then take courses in the department for a period of three years "aggregating at least eighteen points beyond the elementary requirement for admission. (A point is credit for satisfactory completion of work requiring attendance one hour a week for one half year.)" Honor students must have high standing in two or three sequences and also do considerable supplementary reading. A final examination, both written and oral, is set, covering the

entire field of honor work. Honor students would, after the three years, have gained a knowledge of the history of German literature and have taken general and special courses dealing with the classical period and later writers of the nineteenth century. The collateral and supplementary reading at present required consists of above 5000 pages of literary texts representative of the different periods of the literature.

In the elementary work of the colleges the same textbooks are generally used as in the high schools, and doubtless the same variety of method employed. The maturity of the students, many of whom are already too old to begin a modern language, and the fact that it is often prescribed and dropped at the end of the year, probably force college instructors to follow traditional lines of teaching. The lack of uniformity in the preparation given to the students in high school also makes for conservatism in college methods of instruction. The so-called higher courses are very often largely translation courses combined with some literary interpretation. In recent years, however, much more attention has been given to the practical side, and in most of the better colleges there are courses in oral and written composition, either given as separate courses or in connection with some literary course. In a number of institutions, notably in colleges for women, almost all the work of the department is carried on in the foreign language. In still others some of the staff regularly give their lectures in German or French. The undergraduate work is largely literary in character. In the courses primarily for graduates there are in addition to the more specialized literary courses a number which aim to give the student some knowledge of philology and historical grammar. Stress is also laid upon the older periods of the language and literature, and in some institutions modern related languages are taught. The group, Scandinavian languages, for example, is often included in the work of the Germanic departments, although in a few institutions a separate department for these languages has been created.

The more important universities have well equipped libraries, both general and special, for advanced students.

The following is a list of undergraduate courses given by the Romance Department of Adelbert College, Western Reserve University, for 1911-1912, though not all are given in any one year

In French: Elementary Courses; The Classic Drama (Corneille, Racine, Molière, Voltaire); Prose Writers of the Seventeenth Century (Pascal, La Bruyère, Bossuet, Sévigné); Prose Writers of the Eighteenth Century (Montesquieu, Voltaire, Diderot, J. J. Rousseau); Drama of the Eighteenth Century (Marivaux, Le Sage, Regnard, Beaumarchais); The Ro-

mantic School (one of above four sections given each second half-year). Literature of the Sixteenth Century (Montaigne, Rabelais); Outlines of the History of French literature to the end of the Sixteenth Century; Historical French Grammar; French Grammar; History of French Literature.

In Italian. Elementary Course; Dante.

In Spanish. Elementary Course; Reading of Modern Prose and Plays; The Classic Drama; Cervantes.

The following is a list of graduate courses offered by the Romance Department of Harvard University for the year 1911-1912, or alternate years.

French: (for undergraduates and graduates) General View of French Literature; Literature in the Nineteenth Century; Literature of the Eighteenth Century; Literature of the Seventeenth Century; Literature of the Sixteenth Century; The French Drama in the Nineteenth Century; Literary Criticism in France, with special reference to the Nineteenth Century; Rousseau and his Influence.

(Primarily for graduates) Old French Literature; French Literature in the Fourteenth and Fifteenth Centuries; Historical French Syntax; French Prose in the Sixteenth Century; Studies in the French Drama of the Seventeenth Century; Studies in French Drama of the Nineteenth Century.

Italian: (for undergraduates and graduates) General View of Italian Literature; Modern Italian Literature; Italian Literature of the Fifteenth and Sixteenth Centuries; The Works of Dante. (Primarily for graduates) Italian Literature of the Thirteenth and Fourteenth Centuries; The History of the Novel and Tale in Italy and Spain from Beginning of Medieval Period to the Eighteenth Century.

Spanish: (for undergraduates and graduates) Spanish Composition and Conversation; General View of Spanish Literature; Spanish Prose and Poetry of the Eighteenth and Nineteenth Centuries; Spanish Literature of the Sixteenth and Seventeenth Centuries; Spanish-American Poetry. (Primarily for graduates) Early Spanish.

Romance Philology: (primarily for graduates) Old French; Provençal; Low Latin; Portuguese; Anglo-French and the French Element in English. Course of special study: Investigation of Special Subjects in Romance Philology.

Seminary: Meetings every three weeks, for the discussion of theses, etc. In 1911-1912 attention will be given to the history of French words in English.

Secondary Schools. — The study of modern languages in the schools was largely developed during the nineteenth century. Before that period school instruction was not very widespread, nor were the foreign languages given anything but a very minor place in the school program.

Germany. — Although Germany was much in advance of other countries, the introduction of French into the schools did not begin to make any headway until the eighteenth century. Before that time its study was confined to private instruction or to the schools attended by the upper classes (*Ritterakademien*). (See *ACADEMIES, COURTLY*.) By the beginning of the nineteenth century, however, most Prussian gymnasiums offered French as an optional subject. Owing to patriotic reasons, it was banished from the schools in 1816, to be taken up more vigorously a few years later. In 1831 French became obligatory in Prussia, beginning in *Tertia*. Other states followed later, Saxony in 1846, Bavaria in 1854. The study of English was much slower in its development. The relations between the countries were in earlier times not strong, but were kept alive by trade, traveling, and, notably, beginning with the middle of the eighteenth century, by the increased interest in English literature. It was, however, not until as late as 1859 that English was made obligatory in the *Realschulen* of Prussia, although of course it had been gradually introduced in the schools during the first half of the century. Since the refounding of the German Empire, and particularly during the last two decades, the study of English has made rapid advances. In 1900 an imperial edict allowed the substitution of English for French in the three upper classes of the gymnasium (OII, UI, and OI), French remaining an optional subject. It also made possible the substitution of other subjects for Greek in UIII, OIII, and UII, in which case three of the six hours are given to English, and the other three are distributed between French and mathematics and the sciences.

The method of modern language instruction in Germany has, from early times, swung between two poles, — the synthetic and the analytic. Both types of instruction have existed at all times side by side, although, during the first half of the nineteenth century, the method employed in the schools was on the whole synthetic, and a close imitation of the severely grammatical procedure employed in the teaching of Latin and Greek. This was due in part to a great lack of properly trained teachers, for the universities were late in establishing chairs of French and English, the majority coming after 1850. The new facilities for study produced in time an organized and well-schooled body of modern language teachers. Particularly during the last generation have great changes and progress been made toward better ways and means of teaching the subject, so that at the present time no country equals Germany in the excellence of its modern language instruction. The method now widely employed, often called the direct method, is analytic in character, and is a revolt against the older formal grammatical procedure. The

chief points are as follows: Reading occupies a central position in the work in place of grammar, and is selected so as to give pupils a clear idea of the life, thought, and civilization of the foreign people. In all stages, but particularly in the earlier, great emphasis is laid upon oral practice. Indeed, the emphasis upon the spoken language and upon written exercises growing out of the oral work is a salient characteristic of the method. Translations from and into the vernacular cease to be any longer a regular exercise. Grammar study is reduced to essentials, and taught largely inductively. This, in general, represents the plan of the more radical reformers. The more conserva-

tive, forming probably the majority, still favor the retention of translation, and greater emphasis upon the grammatical course.

The work, particularly of the more advanced reformers, has been the subject of much criticism, especially in the last decade, partly because of its too utilitarian tendencies, and partly because of the general instability of pupils' knowledge, mainly on the formal side. The movement, however, represents a great step forward both in aim and practice. Modern language method has never been as efficiently and rationally organized with the idea of giving power to the pupil to use the foreign language either in reading, writing, or speaking.

¹ Optional.

France — German and English are the modern languages most studied in the French public schools, instruction in Spanish and Italian being confined almost exclusively to places near the borders of the respective countries. Of the two languages German is chosen more frequently in the boys' schools. This is partly due to the fact that it is required for entrance to the military school at Saint-Cyr and the *École Polytechnique*. English is more favored in the girls' schools.

Instruction in the modern languages was made optional in *lycées* and colleges in 1821, though but little weight was attached to their study, and but meager time allowed. In 1838 the study became compulsory in the classical course, and in 1847 in the "modern" course. In 1880 modern languages were studied in every class, with a total of twenty-nine hours per week. The kind of instruction, and the results obtained were, however, unsatisfactory. Translation from and into the foreign tongue,

and much formal grammar were the chief means employed almost everywhere, even as late as 1896, although the ministerial instructions of 1890 were in theory in advance of any of the German official regulations of about the same time. The provinces in particular were very backward. The reform, which had already been in progress a dozen years or more in Germany, had as yet made scarcely any impression upon the work in France. In 1902, however, the whole subject of modern language instruction was radically changed. The aims and practices of the advanced German reformers were taken over, stock and barrel, and formulated in the instructions of the 15th November, 1901. Since that time most earnest attempts have been made by the government and the teachers to carry out the new radical program, and apparently with considerable success.

After six years' trial it was found necessary to be more conservative in the work, particu-

MODERN LANGUAGE

larly in the upper classes. The new instructions of 1908 confirm and strengthen the plan of work done in the lower classes. For the fifth and fourth classes translation into the mother tongue, not mentioned in the earlier instructions, is suggested as a means of control in addition to the study of the reading text by exercises in the foreign language. The chief changes, however, are made in the instructions dealing with the work of the second and first classes. The earlier program emphasized reading material dealing with the life, civilization, and history of the literature of the foreign people; the new lays stress entirely upon literature, pure and simple. Moreover, one of the chief exercises of the last period is the cultivation of the art of translation into the mother tongue. These changes, however, are very slight on the whole. France leads the world, officially, in the advocacy of the radical direct method of modern language teaching.

Modern languages may now be studied for eleven of the twelve years in the French *lycées* and colleges for boys. In the second year of the preparatory division and in the eighth and seventh forms of the elementary division the subject is very inadequately represented by two hours for each. Attempts to eliminate the study and to defer the regular instruction until the sixth form have thus far failed. In the following four forms, constituting the first cycle, one modern language is studied five hours per week in each of the four years. In the first two forms of the second cycle the number of hours devoted to modern languages depends upon which of the four possible groups of courses or sections the pupils elect to pursue. The following is a table for these two years:—

	SECTION A	SECTION B	SECTION C	SECTION D
Modern Language	Latin and Greek 2	Latin and Modern Language 3 4 ¹	Latin and Science 2	Science and Modern Language 3 4 ¹

¹ Second language begun and continued

In the highest form there is a twofold division into the philosophy and mathematics forms, each with two sections, A and B.

	PHILOSOPHY		MATHEMATICS

² Pupils have the right as to distribution of these hours.

MODERN LANGUAGE

The modern language course in girls' secondary schools is begun in the infant class and continued as an obligatory study throughout all the nine years. In the last two years a second modern language may be taken. The following is the number of hours per week in each of the classes: 2½, 2½, 2½, 2½, 3, 3, 3, 3 (2)¹, 3 (2)¹.

The following is the number of hours given to modern languages in the usual three classes of the French higher elementary schools, the *écoles primaires supérieures* and *écoles pratiques de commerce et d'industrie*.

Boys' School	I	II	III
General Course } <i>école supérieure</i>	3	{ 3 4	2

Commercial Course } <i>(école pratique)</i>	4½	4½	4½

United States — The modern languages were late in getting a foothold in the program of studies of schools in the United States. There were sporadic attempts at teaching French in the East during the early nineteenth century; but it was not until the second half that its study was at all general. The first mention of German in a Massachusetts' high school is in 1854. German, however, appeared in the Cincinnati public schools as early as 1840, and in general thrived, particularly in parts of the Middle West and other centers where a large German population had settled. It was not until 1875 that a modern language was required for admission to college. Since then the growth in the study of the modern languages has been steady, so that in the period 1890-1910 no subject showed such a high percentage of increase. The study of French advanced in the public schools from 5.84 per cent in 1890 to 9.90 per cent in 1910; German over the same period from 10.51 per cent to 23.69 per cent. The study of Spanish is confined largely to the Western Division of states. In other parts it is pursued only by a few pupils in the larger cities. Statistics were first given for 1909-1910 in the *Report of the United States Commissioner*. The percentage for the whole country is .65 for the combined statistics of public high schools and private high schools and academics. Colorado and California lead, with 17.67 per cent and 8.49 per cent respectively.

In the country at large the study of modern languages is restricted to the secondary school, with courses of one, two, three, and four years' duration. The two-year courses are probably by far in the majority, to meet the college admission requirements, although in the larger

¹ Second language optional.

cities and towns three- and four-years' courses are very common. The Ohio statistics for 1910 show that of 312 high schools reporting German 60 offer a four-years' course, 29 a three-years', 120 a two-years', and 6 a one-year course.

The geographical distribution of pupils studying French and German in secondary schools shows remarkable variations. In general, the North Atlantic Division leads in the percentage of pupils studying both French and German in 1909-1910, with 27.56 per cent as against 11.50 per cent for the rest of the United States. Again, the New England states lead in the percentage of those pursuing French, with 41.21 per cent as against 6.44 per cent for the rest of the United States. On the other hand, the same states are below the average for the United States in the percentage of pupils studying German, 17.21 per cent as against 23.69 per cent for the country as a whole. As an example, also, of the great variation in the study of the two languages in different states, 49.09 per cent of pupils in the New Hampshire secondary schools study French as against 0.69 per cent in Indiana. New Jersey leads in percentage of pupils pursuing German with 41.39 per cent, while the percentages for South Carolina, Louisiana, and Mississippi are 0.34 per cent, 0.72 per cent, and 1.69 per cent, respectively.

It is only in some few centers of the Middle West that there is at present any serious attempt at maintaining the study of German in grades of elementary schools. Milwaukee and Cincinnati are the two great strongholds. In the latter city, if the parents wish it, one half of the time of instruction may be given in the German language up to the fourth grade. The study is then continued throughout the eight grades, but with a reduction in the amount of time.

On the whole, modern languages were, and are still, taught in schools to far too great an extent in much the same spirit and manner as Latin. But owing to ill-equipped teachers and to the shorter length of the courses, the work done in modern languages was only a poor imitation of the kind of work done in the traditional Latin course. Standards were either lacking or were to a large extent controlled by the requirements for admission to college. The course consisted of formal drill in grammar, though lacking in real thoroughness, followed or accompanied by hasty translation into and from the mother tongue, of material often badly graded as to difficulty.

The *Report*, published in 1898, of the Committee of Twelve, appointed by the Modern Language Association, has been of great assistance in fixing standards of modern language instruction in the schools. The method favored by the committee was on the whole the so-called reading method; that is, copious reading of graded texts hand in hand with

the study of grammatical essentials. But the committee also advised, particularly in the longer courses, the introduction of some oral work, and other practices of the German direct method. Three grades of attainment were defined in the *Report*, and reading texts for each suggested. The elementary grade, reached normally after two years of study, represents the minimum requirement now usually set for entrance to college. The work of the two higher grades, the intermediate and the advanced, is intended to take one and two years' longer study than the elementary (See COLLEGE ENTRANCE REQUIREMENTS IN MODERN LANGUAGES.)

Within the past few years, the more progressive teachers, stimulated by the results obtained by the Reformers in Germany, have been trying to adapt to local conditions some of the aims and methods employed abroad. More attention has been given to oral work, and to teaching pupils freer and better control of the language in general. The greatest obstacle to rapid progress, however, is bad teaching, for outside the large city systems there are far too few special teachers possessing adequate knowledge of the subject, and specially trained in methods of presentation.

Aim and Methods of Teaching.—Modern languages are studied in the secondary school primarily for their practical value. Through the choice and study of material a cultural value is added. Moreover, the processes involved in learning a foreign language are conceded to be disciplinary in their effect; they serve to clarify, deepen, and broaden one's knowledge of language in general as a vehicle of thought. The practical goal sought in the course may be regarded from at least two points of view. We may stress the utilitarian side, the practical oral control of the language, allowing the reading of books to appear as a natural outgrowth, or we may make reading the chief aim. The first way might seem upon the surface both a desirable and a logical one to pursue. Yet experience teaches us that the school is not a favorable place for the acquisition of a language technique commensurate with the energy that would have to be expended and for which there is not sufficient time. The field of reading, on the other hand, is not only broad and cultural, but the kind of work required to teach pupils to read successfully, is quite in keeping with school conditions. Moreover, the ability to read a language is more likely to be of permanent practical value than any conversational knowledge that might conceivably be gained in school classes.

Pronunciation.—The importance of teaching the foreign sounds correctly in the early weeks of the modern language course cannot be too strongly emphasized. The work should largely be upon an imitative and oral basis, the teacher acting as model. It is also important that he possess a working knowledge of phonetics. This will insure the right attitude toward this element of the course, and

enable him to diagnose and correct mistakes wherever imitation is insufficient as a guide. Whether the pupils themselves shall be taught phonetic terminology and the foreign sounds at first by means of transcribed texts is a moot question. There are good arguments both for and against, particularly when dealing with a language like French. In any case, it is fundamental that there should be abundant practice in hearing and uttering the sounds of the new language.

Oral Practice.—Although intelligent reading is the chief end sought, a great deal of attention ought to be given to work in hearing and speaking, because of their very positive value in classroom procedure. In general, emphasis upon the spoken word makes for greater flexibility in the treatment of the material. It is stimulating both to teacher and pupil. Imitation and repetition are fundamental means of acquiring a new language, and if oral exercises in the foreign tongue are employed with judgment, there is no kind of work which allows and suggests to the teacher greater abundance of repetition, and hence tends to make right associations habitual. Moreover, the constant use of the foreign language in the classroom in the form of commands and well-directed questions and answers, favors the formation of a *Sprachgefühl*, or language sense, an indefinable though undoubtedly a potent factor in the acquisition of a foreign language. The amount of time to be devoted to work in speaking cannot readily be determined. In general, however, practice seems to favor greater emphasis proportionally during the elementary stage, at a time when a great deal of drill is necessary to acquire the grammatical forms and a working vocabulary. But throughout the course it should be the rule to have regular oral practice carefully graded and coördinated with all other elements of the course. Only in this way can we be assured that it shall be beneficial in the work. The scope of work in speaking and its distribution in the different years of the course, its relation to other elements such as reading and grammar, have not as yet been satisfactorily worked out, particularly for the later stages. Adequate books and specially trained teachers are still lacking.

The earliest material will probably best be selected from objects in the immediate environment; and wall pictures, if judiciously employed, will be of great assistance in planning the elementary work. The bulk of the material for the secondary school, however, should be chosen from connected reading texts. In the elementary stages these will consist of simply constructed texts or natural texts that are rich in certain grammatical forms or vocabulary. Later the regular annotated stories, etc., may be made the basis for conversational practice. Still, for many reasons, chief among which are that the reading texts may not lend

themselves to conversational treatment, that the vocabulary may be too uncommon or too highly literary in character, and above all, that the selections may be too difficult, it would seem advisable on the whole to have separate texts for conversational practice, carefully organized as regards vocabulary, content, and form. Graded material dealing with foreign life and customs is suggested.

Work in speaking may be roughly divided into two kinds: (1) highly formal in character, (2) a more natural kind, which emphasizes the thought as well as the form side of the material. The first kind will consist of various changes in the sentences read, in person, number, tense, voice of the verb, and substitutions of pronoun for noun, etc. Questions may be put in such a way as to force the pupil to employ the desired grammatical form. The second type will consist largely of rapid questions and answers upon the day's reading. In the earlier stages the questions and answers would closely follow the printed text, later the text might be used merely as a starting point for conversational practice, the pupils drawing their answers from their general knowledge of the spoken language. From time to time the class would be encouraged to relate the contents of a part or the whole of the material thus intensively studied. Success, however, in the later stages depends upon the thoroughness with which the so-called question and answer work is done. In any high school course simple questioning on a suitable connected text should occupy the major portion of the time in oral practice. It is only in this way that fluency and the requisite accuracy are assured.

Grammar.—Whatever other value the study of grammar may have in the mental training of the pupil, its immediate value is to enable him to acquire the foreign language on the form side systematically and intelligently. Only essential forms and usages should be selected, and these should be taught by constant practice rather than by drill upon rules. Correct habits of use should be regarded as of more importance than the mere learning of paradigms. In general, the treatment of grammar should be at least inductive in spirit. Traditional grammar teaching regards the translation of a number of detached sentences from and into the mother tongue as the chief exercise for clinching the previously studied formal rules. More recent teaching, however, lays great stress upon exercises planned to give a great deal of oral and written practice carried on in the foreign language itself. Some of these exercises have been suggested under the preceding topic, such as changes of tense, number, and person, etc., based upon disconnected sentences or connected reading material. The filling out of appropriate endings and a large variety of exercises all serve to give more copious and quicker drill than the older translation method. Of greater importance than

these, however, are the more or less formal question and answer drills, in which the teacher's questions force the pupil to employ the new grammatical principle or form. Many of these questions will be type questions, that is, one question will admit of a comparatively large number of answers, each one of which, however, will contain the required principle or form. The judicious employment of this so-called living grammar teaching is of great advantage in giving quick, definite, and withal interesting drills which to a large extent are wanting under the still widely prevailing plan of translating detached sentences into the foreign tongue.

In a course lasting four years it seems highly desirable, in German at least, to have the first grammatical course extend over two years. The last two years might then be spent in giving richer practice and somewhat broader treatment. This plan, however, is not practiced in the majority of schools, with the result that pupils in the higher classes are often weak both in knowledge of forms and in the ability to use them accurately for the expression of simple thoughts in the foreign language.

Written Work. — Work in writing should accompany at every step the oral work in the German classroom. As a rule, it should follow directly the oral development of, and drill upon, the grammatical topic. After the material has been first threshed out orally in the classroom, it should then be put into writing, for the time being the final form. As everything cannot be written, the work should represent that which is typical and essential in the lesson or series of lessons. The results obtained from writing are fairly obvious. Hand and eye serve to fix the oral impressions, and it checks up the work on a given topic. Further, it makes for greater definiteness and flexibility in the work done outside of class. In the early stages, however, it is better to have much of the written work done in class, and thus controlled and corrected at every step. But wherever done it is a wise procedure to ask of pupils that they shall employ in their written exercises only the materials, vocabulary and principles, with which they are quite familiar through previous study.

Work in writing may be of two kinds: (1) exercises largely imitative in character, (2) exercises in translation, involving comparison between the mother and the foreign tongue. The latter type is still largely employed in all stages of the course. Latterly, however, teachers have found that written exercises, similar to, and in fact growing out of, the conversational practice, are productive of better results. In addition to the more formal exercises which emphasize a certain grammatical fact, the simple narrative of the day's lesson, and the introduction in the upper classes of the letter form of composition, offer a rich field for development. Over against this

rather modern procedure, we find a large proportion of teachers still faithful to exercises in translating from the mother into the foreign tongue. In the early stages the exercises consist of detached sentences arranged under the appropriate grammatical headlines in the textbook. Later, a graded composition book, containing various styles of writing, is employed. As this kind of work prevails, often to the exclusion or at least only fitful use of free reproduction and other nontranslation kinds of exercises, it is well to point out some of the weaknesses of the practice. (1) Pupils are made to learn the foreign language by comparison before they have sufficient knowledge of its vocabulary and principles. (2) The composition books are far too ambitious in character. The acquisition of speed and accuracy should be regarded more highly than the ability to translate difficult material inadequately. Written work of all kinds ought largely to consist of material that the pupil can readily do at sight.

Reading. — Since reading is the chief aim of the modern language course, great care should be exercised not only in the selection, but also in the treatment of the material. It should be interesting, possess literary merit, and be well graded as to difficulty and the maturity of the pupils. At present, the general tendency is to read stories, and in the later years some poems and plays of classical writers. Unity and point of view are lacking in the course. It is organized only as to general amount and difficulty required for entrance to college. It would seem desirable to increase the kind of reading dealing with facts, particularly with those that give an insight into the life, customs, and history of the foreign peoples. In a four-years' German course we might, for example, group the reading material around some definite points such as these: first year, a general introduction to German life; second year, legends and sagas and the *Marchen*; third year, some few facts of history as illustrated by the lives of great personalities; fourth year, at least one literary masterpiece and brief sketches of the lives of such men as Goethe, Lessing, and Schiller.

The traditional treatment of reading is that of translation into the mother tongue. More recently systematic attempts have been made, notably in Germany, to reduce the amount of time spent upon this exercise and to increase the ability of the class to study and understand the foreign text without the aid of habitual translation. Clearness of understanding in the early stages is effected by selecting simple, objective material and teaching it by means of close questioning in the foreign tongue, by explaining new words by the use of objects, pictures, gesture, by opposites, by the study of word formation, by definition in the foreign language, or even by translating troublesome words and phrases. If the work is systematic-

cally done from the outset, translation may be limited largely to the more difficult passages, and the time usually devoted to it be employed in various exercises carried on within the language being taught. How much shall be translated is a question, however, which individual teachers will always have to decide for themselves. Length of course and the equipment of the teacher are the controlling factors. It is obvious that translation is the quickest apparent test of the pupil's understanding of a passage, although where it is used to the exclusion of all other exercises upon the text, some of its weaknesses may be summed up as follows:—

In general, translation is largely an exercise in the use of the mother tongue. As an exercise for the teaching the foreign language, it is wasteful of time as a vocabulary builder. Since the pupil exchanges symbol for symbol, it neglects almost wholly the acquisition of the form side of the foreign language, and as usually carried on, it lays but little stress upon the thought side. It has little or no influence upon the growth of language sense (*Sprachgefühl*). The foreign language is kept in the background, and is used as a mere vehicle for exercising the mother tongue.

Results of School Work.—What, briefly, should be the outcome of a four years' high school course in modern languages? The pupils should be able to read ordinary prose or poetry suitable in range of thought to their years of understanding. By far the greater proportion of the materials should be selected from modern authors. While there can be no objection to the appreciative study by the pupils of one or two of the classic dramas or other forms of literature, the reading of the classics in general should be deferred to the college period of modern language instruction. By the selection of reading material and by all other means that the teacher can devise, the pupils should be taught some elementary facts regarding the life and customs of the foreign peoples. They should have obtained by careful teaching an accurate working knowledge of the essentials of grammar in order that their growth in knowledge of the language shall always be upon a solid foundation. In addition, the pupils should have acquired the power to use a small stock of common words in speaking or in writing. They ought, for example, to be able to answer questions based upon an easy story read to them, or to give its contents in simple language either orally or in writing. Finally, they ought to have some facility in conversing about simple matters of daily life, and be able to express their doings in letter form. E. W. B.-C.

MODERN SCHOOL (*Escuela Moderna*).—

The term given to the school established by Francisco Ferrer (*q.v.*) at Barcelona and imitated now in urban centers in many countries

by groups holding radical social views. These schools are generally projected by the so-called philosophical anarchists, and are extremely rationalistic toward religious ideas and influences.

The *Escuela Moderna* of Barcelona is summed up by its motto: "Scientific and rationalist teaching." This does not mean that rationalist schools in Spain started with Ferrer or that the principles enshrined in the *Escuela Moderna* originated at Barcelona. As a matter of fact, Ferrer only gave fresh vitality and a more distinctly scientific rationalist tone to a more or less non-religious movement in popular education that seems to have been racy of the soil of Spain for several decades prior to the founding, in 1901, of Ferrer's *Escuela Moderna*. (Cf. Heaford's *L'École Moderne*, ed. 2, *passim*, and Archer's *Life*, etc., p. 31.) This early movement has an interesting and hitherto unknown history. On the fall of Isabella II in 1868 from the throne of Spain, a ferment of liberal ideas stirred the Spanish mind; a craving for education seized the masses, and secular schools arose in many parts of the Peninsula. (*L'École Moderne*, pp. 11 sq.)

The schools grew out of the enthusiasm of the various political, industrial, and rationalist groups that sprang up throughout Spain. The schools were admittedly ill-equipped and deficient in methods, most of the teaching being undertaken by untrained enthusiasts consisting of a Bohemian set of intelligent artisans, journalists, and social outlaws of all kinds. These were mostly Freethinkers, and some—notably Clemencia Jacquinet, afterwards the first Directress of the *Escuela Moderna*—were natives of France. (For her career see *L'École Moderne*, p. 17; Archer, *Life*, p. 34 sq.)

In 1883 the new schools had so much grown and multiplied that a federation—for some time controlled by Bartholomeo Gabarro, an ex-priest—was founded for their protection. Long prior to Ferrer's initiative, the Spanish Freethinkers had recognized the necessity of safeguarding and spreading their ideas by means of schools run under Rationalist auspices. One such school, founded as far back as 1885—that known as *La Verdad*, at San Feliu de Guixols—was still flourishing in connection with the *Escuela Moderna* in 1907.

When, therefore, Ferrer founded his Modern School he was not launching a new movement; he was only cultivating with improved processes a ground already plowed and sown. Nor is it true to say that the *Escuela Moderna* was the Aaron's rod that swallowed up the hitherto existing secular schools in Spain. The fact is that many of the old schools, and others formed later, were autonomous bodies existing independently of the *Escuela Moderna*, though all became more or less imbued with its principles by adoption of its educational program and textbooks.

Ferrer's Manifesto (*L'École Moderne*, p. 31) on starting the Modern School stated its object to be the progressive education of the child, without superstition (he meant, Catholicism) or mysticism (Protestantism). He specially sought to avoid the awakening of what he termed the atavistic instincts of religion, race hatred, the military temper, and the spirit of revenge.

His whole school curriculum and its auxiliary publications were inspired throughout by this ideal; and Ferrer's provision of a new social order explains why he did not accept the pedagogic doctrine that the child's school-books should be silent concerning God, religion, and similar burning questions. On the contrary, his avowed aim was to enable the child to render to himself a faithful account of the source and origin of the varied social evils that afflict humanity.

The Modern School was opened in the Calle Balén, Barcelona, on the 12th September, 1901, with twelve girls and eighteen boys. At the conclusion of the first year the scholars totaled some sixty-six in all. In June, 1905, after four years of activity, there existed forty-eight schools, of which fourteen were at Barcelona, two at Cartagena and La Union, and one in Algeciras, Cadiz, Granada, Mahon, Malaga, Saragossa, etc. In 1906 the number of schools was about fifty. Early in the same year the movement had so well succeeded that Ferrer was able to invite 1700 students of the schools affiliated to the *Escuela Moderna* to a rationalistic Good Friday banquet—a celebration which gave great offense to the Catholic party in Spain. (Archer, p. 61; cf. *L'École Moderne*, p. 30.)

When, in June, 1906, Ferrer was put under lock and key for thirteen months (see FERRER), nothing could arrest the torrent of the movement in Spain for the establishment of rationalist schools. New schools arose on every hand, and fresh educational centers sprang into being. Of these, one of the most successful was the *Escuela Moderna*—*Humanidad Nueva*—at Valencia. Founded by Dr. Samuel Torner in July, 1906, in December, 1907, it numbered 150 scholars of both sexes. The repression in 1909 closed this school, after eight others had formed around it.

Elsewhere in Spain some fifty new schools had been founded by February, 1908. Exact statistics as to school attendance at these several foundations are not available; the particulars, however, as to ten of the schools in Barcelona indicate that these latter served a total of 1000 pupils. Moreover, it is estimated that the government closure in 1909 of the rationalist schools in different parts of the country deprived more than 10,000 children of their usual and only means of education.

The school hours at the *Escuela Moderna* were from nine in the morning to 5.30 in the afternoon. The school was open from Monday

to Saturday inclusive, the Sunday being devoted to lectures on scientific subjects. Boys and girls were taught together. Ferrer speaks from experience of "the brilliant result, I may even say the triumph, of mixed teaching."

The scholars were grouped only under three sections: Infants, Elementary, and Higher Elementary. In each section the first ten minutes of the school day were devoted to hygienic inspection and gymnastic exercise. The following briefly describes the curriculum under each section:—

Infants: Exercises in observation on familiar objects and knowledge of life.

Reading (the *Salvatio*,—described and Ferrer's view thereon cited, in *L'Éc. Mod.*, pp. 32-33) and writing.

Grammar (Span.).

Arithmetic, its operations illustrated by the combination of objects.

Geometry: knowledge of lines according to their nature, position, etc.

Physical geography.

Object lessons: based on animal, vegetable, and mineral objects, and on industrial, etc., products.

Familiar scenes: animal life.

Manual labor.

Gymnastics without appliances.

Hygiene.

Elementary Section:

Amplification of above lessons.

Reading, with explanation of word meanings.

Books used: *Adventures of Nono* (Archer's description, p. 39), *Leon Martin* (by Malate), *Estevanez's History of Spain*, and the *First Manuscript Book*, a collection of extracts from best authors, used as an exercise in reading various kinds of script.

Writing from dictation.

Drawing: plain and decorative.

Physical, agricultural and industrial geography of Europe generally and of Spain and Portugal in particular. Needlework, and carving.

Higher Elementary

Reading, with comments.

Texts: Patriotism and Civilization, Malvert's *Origin of Christianity*, *The Second Manuscript Book*, Paraf-Javal's *Substancia Universal* (for Ferrer's view of this see *L'Éc. Mod.* p. 39), Jacquinet's *Historia Universal*. (3 vols. See Archer, pp. 49-51.)

Writing: Composition exercises, comments on the school texts, etc. These compositions, no doubt, gave birth to the remarkable school essays cited in the *Boletín*. (Año III, p. 1, Año IV, pp. 1-6; cf. Archer, pp. 54-58, and *L'Éc. Mod.* p. 37.)

History: General idea of the history of peoples from the point of view of the development of civilization. (Jacquinet's three remarkable volumes of history led the way for the student.) (Now translated into Portuguese, Lisbon.)

Shorthand classes twice a week.

In addition, we must count to the credit of the *Escuela Moderna* the botanizing, geological, and natural history rambles in the neighborhood of Barcelona (descriptions and photographs in the *Boletines*); the visits of inspection to the factories and industrial hives of the Condal City and vicinity, in order to study the processes of production; the lectures on every branch of hygienics by Dr. Martinez Vargas: those on physical geography, mineralogy and geology, etc., by the celebrated Dr. Odón de Buen, many volumes of whose works

adorn the collection of Ferrer's publications. These lectures were delivered every Sunday to the students, their parents, and the general public at the school, and were deservedly popular. No elementary private school in Europe could boast of finer courses of lectures by professors of greater national and world-wide reputation.

By means of these popularizations of scientific knowledge and of the unique series of school texts and other publications (see FERRER), the founder of the *Escuela Moderna*, at the cost of his fortune, his liberty, and ultimately of his life, provided the neglected people of Barcelona, and, radiating therefrom, some hundred or more centers in Spain, with the nearest approach to the encyclopedic curriculum of a university *en règle* that probably any democracy in Europe has had placed within its reach. The students at the Modern School were demonstrably more fortunate in educational advantages than millions of children in more fortunate countries than Spain. Ferrer would have been the first man in the world to acknowledge the imperfections of his system, but, for all that, the schools were admittedly "very well managed and very well equipped."

See FERRER.

MODERN SIDE.—A term applied to that division in English secondary schools in which the chief emphasis is laid on modern subjects, — language, science, and mathematics. Of the classical languages Latin alone is studied to a small extent. The modern side is intended for the preparation of boys for business, army, and civil services. In some schools commercial

MODESTY

subjects are also taught in this department. As a rule boys do not proceed from the modern side to the universities. In addition to the modern side, it is not unusual to have other special divisions for science and mathematics. While modern subjects have been taught since the seventeenth century here and there in English schools, no value was attached to them either by the boys or masters. Since the passing of the Endowed Schools Act, however, the modern sides have sprung up to meet the increasing demand for a type of secondary education which did not aim at preparing for the universities. The modern side may on the whole be said to correspond to the German Realschule.

See **ENDOWED SCHOOLS ACT**; **GRAMMAR SCHOOLS**; **ENGLAND, EDUCATION IN**, etc.

MODESTY. — This term is used to denote two quite different characteristics of the emotional life, which Darwin has pointed out have little in common except the blush as a distinguishing expressive reaction. In the first sense the term refers to that characteristic of some individuals which tends to make them hold a moderate opinion of their own worth and attainments. Used in the second sense, modesty is an attitude of mind which revolts against indelicacy of any sort, especially that involving sexual relations. From the psychological point of view, both of these forms of reaction are instinctive attitudes and accompanied by emotional feelings, and capable, like other instincts, of modification and training by the influence of environment. Development of modesty in the second sense does not properly take place until the time of puberty, though it is not always of sexual origin.

MOERBEKE, WILLIAM OF (d. 1281). — Archbishop of Corinth (1277-1281), and translator of Aristotle. He derived his name from a small town on the borders of Flanders and Brabant, whence he is also known as William of Brabant or William the Fleming (as he is called by Roger Bacon). He was chaplain to Clement IV and Gregory X, and acted as Greek secretary at the Council of Lyons (1274). He translated Aristotle's *Politics* and *Rhetoric* from the Greek, and also Hippocrates' *Prognostics*, Galen's *De Alimentis*, and Proclus' *Decem Dubitationes, De Providentia, and De Malorum Subsistentia*. The translations of Aristotle, though very literal, are of value as representing a text, now lost, better than any now extant.

MONASTICISM AND EDUCATION. — The vast subject of the relation of monasticism to education is treated from so many angles in various articles of this Cyclopædia that a special treatment is superfluous. Under this caption the only attempt will be to relate organically these scattered accounts. The fundamental problem, about which there is much controversy as to whether the more important and general educational activities during the Middle Ages were carried on by monastic bodies or by the secular organization of the church, is discussed under the titles **ABBAY SCHOOLS** and **CLOISTER SCHOOLS**, these being the general terms used for monastic schools in England and Germany, respectively. The general conclusions of these discussions, contrary to the commonly accepted views, is in favor of the regular church hierarchy, and adverse to the claims of the monastic organization. A similar view is expressed in the general article on **EDUCATION DURING THE MIDDLE AGES**. Here the relation of the monastic organization and theory to the general intellectual and educational conditions is discussed. On the other hand, the actual educational work of the leading monastic organizations is presented in the separate articles on the leading monastic bodies, such as the **BENEDICTINES**, **FRANCISCANS**, **DOMINICANS**, **CISTERCIANS**, and others. The relation of these bodies to the education of women and girls both during the Middle Ages and the modern period is presented in the articles on **CONVENT SCHOOLS** and in the historical section of the article on **HIGHER EDUCATION OF WOMEN**. The educational work of the post-Reformation period, and of the monastic orders having education as one of their chief functions, is presented in the articles on the **JESUIT SYSTEM OF EDUCATION**, the **PORT ROYALISTS**, the **ORATORIANS**, the **PIARISTS**, and the **TEACHING ORDERS OF THE ROMAN CATHOLIC CHURCH**. The philosophical aspects of monasticism are considered under **MYSTICISM**, **NEO-PLATONISM**, and related topics, **SCHOLASTICISM** and **SCHOOLMEN**. For noted monastic educators, see the articles on the

special orders. For the bibliography of the subject, see the reference lists in connection with the articles mentioned above.

MONGE, GASPARD, COMTE DE PELUSE.—Was born at Beaune, May 10, 1746, and died at Paris, July 28, 1818. He was one of the leading mathematicians of his time, and is known for his work in descriptive geometry. In the history of education he is worthy of recognition as being one of those most active in promoting the *Ecole Polytechnique*. He first taught his descriptive geometry in one of the military schools (1768) as a secret of the service. He later taught it in the *Ecole Normale* at Paris (1794), and still later in the *Ecole Polytechnique*. Politically his life was one of turmoil. Although an ardent revolutionist, he barely escaped the guillotine. He was in great favor with Napoleon, but on the restoration he was deprived of all his honors and offices, and died soon after as a result of his disgrace.

D. E. S.

MONEYS, SCHOOL.—See APPORTIONMENT OF FUNDS; SCHOOL FUNDS.

MONISM.—The name for the philosophical theory which holds that there is but one ultimate substance or reality. The term is quite formal in character, connoting nothing about the nature of the one ultimate being. Thoroughgoing materialism, absolute idealism, panpsychism, pantheism, are alike monistic. The vagueness of the term is enhanced by the fact that the motif of some monistic systems is opposition to dualism, while that of others is opposition to pluralism. Consequently, some contemporary theories are monistic in their denial of dualism (*q.v.*), especially as relates to any final cleavage between mind and matter, and yet are pluralistic in holding that the various forms in which the one ultimate reality occurs do not form an interdependent necessary whole, but are relatively independent of one another, or form real individuals.

J. D.

MONITORIAL SYSTEM.—In one of the *Arabian Nights* a scamp who could neither read nor write opens school and conceals his ignorance by setting the children that knew a little to teach those that knew less. His plan has often been tried since. It is prescribed by the ordinances of a sixteenth-century grammar school; a Portuguese traveler saw it in India in 1623; Comenius (*q.v.*) suggests it in the *Great Didactic*; Mme. de Maintenon (*q.v.*) introduced it at Saint-Cyr; Rollin (*q.v.*) mentions it as a useful expedient; Herbault applied it in the Paris Hospice de la Pitié in 1747 and the Chevalier Paulet in an orphan school at Vincennes in 1772; and the Abbé Gaultier, a refugee from the Revolution, practiced it in the capital of the only country where it was ever employed on a large scale.

Its spread in the United Kingdom was facilitated by a combination of causes. Long and acrimonious disputes in the press, on the platform, and even from the pulpit as to the rival claims of Bell (*q.v.*) and Lancaster (*q.v.*) to the honor of inventing it, made it generally known; its cheapness rendered the establishment of schools possible just when the public conscience was awakening to the need of them; and two great educational societies (see BRITISH AND FOREIGN SCHOOL SOCIETY and NATIONAL SOCIETY) were founded to establish schools in which it could be applied to teaching children to read the Bible or the Church Catechism.

Bell was led (in 1791 or 1792) to employ monitors because the masters of a school at Madras of which he was superintendent offered a passive resistance to his efforts to introduce the native method of teaching the alphabet by writing on sand. In 1797, after his return to England, he published an account of his *Experiment*, but the book attracted no attention, and the author, who had settled down in a snug rectory, allowed it to be forgotten till Lancaster began to excite public interest. Lancaster began (about 1801) to employ monitors because his school had grown too large for him to teach alone and he could not afford to pay for help. There is no doubt that the idea occurred to him independently, but before he had worked it out in all its details he came across a copy of the *Experiment*. He closes the account of his *Improvements* (published in 1803) with an acknowledgment that he had "adopted several useful hints" from the *Experiment*, and with an expression of regret that he was not "acquainted with the beauty of" Bell's plan "till somewhat advanced in" his own.

That Lancaster could be accused (with that appearance of truth which even a false accusation requires) of counterfeiting Bell shows that there must have been a considerable resemblance between the two systems. An account of the differences between them would occupy more space than the importance of the subject warrants, but it may be stated generally that Lancaster's was far more elaborate than Bell's. Bell held that for a class "the best number" was "from twenty-four to thirty or in large schools to forty"; Lancaster thought ten the ideal number for a "draft." For teaching alone therefore he required far more monitors, and he employed them for many other purposes. "When a child was admitted, a monitor assigned him his class, . . . when he was absent one monitor ascertained the fact and another found out the reason; a monitor examined him periodically and when he made progress a monitor promoted him; a monitor ruled the writing paper; a monitor made or mended the pens; a monitor had charge of the slates and books; and a monitor-general looked after all the other monitors." Bell expected his masters to exercise initiative and

MONITORIAL SCHOOLS.

judgment; Lancaster expected his to do little more than watch and admire the "system" working almost automatically. Beyond the adoption of sand-writing Bell made hardly any change in the old methods of instruction; Lancaster, who (with proper acknowledgment) copied the sand writing, used wall sheets instead of books for reading, and slates instead of paper for writing, invented dictation, and a method (now happily forgotten) of teaching arithmetic. Bell's rewards and punishments were few and simple; Lancaster's rewards in practice and punishments on paper were many and curious.

The fact that the monitorial system, so often abandoned elsewhere after a brief trial in one or two institutions, should have flourished throughout the British Islands for some forty years may be attributed to its cheapness and its (comparative) effectiveness. (1) The initial cost was small, as neither Bell nor Lancaster required more than a bare room, which was often found ready to hand; and neither required much furniture, the pupils standing at most of the lessons. The cost of maintenance was greatly reduced by dispensing with assistants; Lancaster boasted that in his schools it did not exceed "seven shillings each child for twelve months, and probably may be reduced by the perseverance of the inventor under unmerited opposition to four." In days when the establishment and maintenance of schools depended entirely on enlightened benevolence, Bell and Lancaster made their establishment and maintenance possible.

(2) In the old schools the method of teaching was individual; hence the children, except during the few minutes that they were "saying their lessons" to the master or mistress, were generally wasting their time. In a monitorial school, divided into classes, with an abundance of teachers of a sort, there was no idling. One of Lancaster's maxims was "Let every child at every moment have something to do and a motive for doing it," and Bell would not have disclaimed it, if any one else had uttered it. Another cause of comparative effectiveness was that, while none of the old teachers had been made and few of them had been born, Lancaster's and Bell's teachers had all been trained, after a fashion. Nobody may have seen the necessity for teachers to be taught the principles of education, but everybody could see the necessity of studying a new machine before being placed in charge of it. Lancaster began training apprentices in 1805, and adults were admitted to "learn the system" from 1809 in the Central School of the British and Foreign School Society in the Borough Road (*q.v.*) and from 1812 in the Central School of the National Society in Baldwin's Gardens. Thus, though the best monitorial school may have been poorer than most of its successors, the poorest must have been better than most of its predecessors.

The inherent defects of the monitorial system are too obvious to need pointing out, but there was an economic consideration which told as potently as the educational considerations against permanence. The monitors were necessarily the brightest and most forward children, and parents who sent them to school to learn would be unwilling that they should remain to teach. The managers tried to overcome the parental unwillingness by paying the monitors a few pence a week, but the inducement was inadequate when a few shillings a week might be earned elsewhere. One consequence was the employment of a smaller number; another was the modification of the system. In 1839 the committee of the British and Foreign School Society reported that they were "by no means disposed to bind themselves exclusively" to it, and in 1841 they reported that "the British System as now practised in the Central School may properly be denominated mixed, simultaneous teaching being satisfactorily united with that which is monitorial." The mutation might have gone on indefinitely, if the system had not suffered transmutation. After the issue of the famous Minutes of 1846, the monitor receiving a few pence a week from the managers became a pupil teacher apprenticed for five years, receiving a fair wage from the government with the promise of a subsequent Queen's scholarship tenable for two or three years in a training college. Thus the monitorial system, besides giving England cheap schools which afterwards became good schools, led ultimately to her having a body of efficient teachers.

Spread of the System. — Lancaster's English supporters saw in his plan not an end, but an instrument, — an instrument for teaching the children of the poor to read the Bible. That their purpose was not limited to their own country is indicated by the title which they deliberately adopted, — the British and Foreign School Society. The society had no paid agents abroad, but William Allen (*q.v.*) and other members, acted as its voluntary agents in the course of their travels. It did not directly establish any schools outside the United Kingdom, but it was always ready to give information; it sometimes furnished teachers; and it often made grants of books and material.

France. — France was the only foreign country in which the monitorial system was ever widely diffused. The first steps toward its introduction were taken by the Society for the Encouragement of National Industry. Having during the war heard vague reports of the extraordinary success of the system, the society, when the treaty of 1814 made peaceful intercourse possible, sent over four of its members to investigate — the Comte de Laborde, the Comte de Lasteyrie, François-Edmé Jomard, and Jean-Baptiste Say. They were present at the half yearly meeting of the British and Foreign School Society in Novem-

ber, and visited the Central School in the Borough Road, the Central School of the National Society in Baldwin's Gardens, and several other schools in various parts of the country. On their return Laborde and Lasteury wrote books on the system, and Jomard wrote a long report on it for the society; Say only describes its "admirable effects" in the book which he wrote.

The deputation having returned to Paris, the society which had sent them met on Mar. 1, 1815, and resolved to form an independent association (the Society for Elementary Instruction). Napoleon landed on this very day, but the change of government did not impede the movement. On Apr. 27, Carnot, the new Minister of the Interior, presented a report to the Emperor, which was followed by a decree ordaining the minister to make inquiries as to the best methods of education and to establish an experimental school in Paris. This school was opened in an "apartment" in the Rue Saint-Jean-de-Beauvais on June 13, the master being the Rev. Francis Martin, of Bordeaux, trained in the Borough Road. Although he was a Protestant, his employment was rendered possible by the liberal rule of the society: "All possible care shall be taken that the first principles of religion shall be inculcated, the developments of which shall be left to the ministers of religion." A minority of the committee considered that this did not involve the reading of the Scriptures, but the president, the Baron de Gérando, wrote to Martin on Aug. 24, entreating him not to delay putting into the hands of his scholars the Bible of Royaumeont, which was not a Bible at all, but a collection of scriptural pictures with explanations.

The government of the restored monarchy did not at first manifest any hostility. On Nov. 3, 1815, the Prefect of the Seine, the Comte Chabrol de Volvic, appointed a board of primary instruction for the prefecture, and on Feb. 29, 1816, a royal decree was issued granting fifty thousand francs a year to the Society for Primary Instruction, and appointing a primary education committee for every canton. Except for the grant, the decree was little more than a pious wish, as it provided no means for compelling the committees to act and no money for them if they did act; still it must have had some effect, for fifteen hundred monitorial schools were opened before 1820.

A heated polemic began in 1816. As in England Tories supported Bell and Whigs Lancaster, in France the clerical reactionaries advocated the simultaneous method employed in the schools of the Christian Brothers (*q.v.*) and the Liberals the method which, to avoid a foreign name, they called mutual. The reactionaries had sufficient influence to obtain a decree that all Protestant teachers should be dismissed, that the Roman Catholic reli-

gion should be taught in all schools, and that the Christian Brothers should have a monopoly wherever they chose to exercise it. Though the reactionaries failed in their effort to suppress the royal grant, they were on the whole successful; only six hundred monitorial schools remained open in 1828, and these continued only till the inherent difficulties of the system became manifest. The Society for Elementary Instruction is still in existence.

Russia.—Alexander I was a religious and benevolent despot. He was considerably influenced by some Quakers settled in St. Petersburg. It was probably from them that he heard of monitorial schools, and in 1813 he commissioned Joseph Hamel to report on them. On his own visit to England after the peace of 1814 his interest was deepened. He sent four youths to the Borough Road to "learn the system," and ordered its introduction into the military schools. Some of the nobles, from flattery or conviction, established schools on their estates. A few of these long survived the Czar.

Norway and Sweden.—Accounts of the monitorial system were published in Sweden by the Count Jacob de la Gardie, who lived in London, by Mr. Svensson, who was sent over by the King, and by J. A. Gerelius, one of the King's secretaries. These three were the leading spirits of a society established in 1822 to promote the establishment of schools. Some years later Parliament voted funds for the establishment of a normal school. In 1841 there were nearly five hundred schools on the plan, but the law of 1842 making education a national concern caused cheapness to be no longer the chief consideration, and monitors gradually disappeared.

Denmark.—The prime mover in Denmark was the Chevalier d'Abrahamson, who wrote a book on the system and in 1819 established at his own cost the first model school. Encouraged by the King and Queen, the new plan made rapid progress; by 1831 it was used in nearly 3000 schools, and a knowledge of it was one of the essentials of the teacher's diploma.

United States.—Monitorial methods of instruction were introduced into the United States through the Lancasterian System as first embodied in the work of the Public School Society of New York City from about 1809. This system spread very rapidly throughout the country, especially in urban communities, and its popularity and cheapness did much to further the interest in popular education. Monitorial methods were not limited to elementary schools, but academies, indeed whole state systems of academies as in New York and Indiana, were organized, at least ostensibly on the basis of these methods. The Lancasterian plan had lost its vogue by 1840, but monitorial methods both in organization and in teaching were popular and widely used for more than a generation later. They have sur-

vived into the more recent generation however only in a very subordinate rôle in schoolroom management. The extent of the influence of the monitorial system is treated somewhat indirectly in the articles on New York City School System, Public School Societies, and on Joseph Lancaster.

Other Countries.—In European countries (such as Germany and Holland) which had a good system of education the monitorial system had no acceptance; in backward countries (like Italy and Spain) its acceptance was sporadic. Missionaries used it in the West Indies, and under the direction of James Thomson, an agent of the British and Foreign Bible Society, it achieved a remarkable success in South America. D. S.-N.

MONITORS.—See MONITORIAL SYSTEM; PREFECT AND PREFECTURAL SYSTEM.

MONMOUTH COLLEGE, MONMOUTH, ILL.—A coeducational institution opened as an academy in 1853 and chartered as a college in 1857 under the control of the United Presbyterian Church of North America. Preparatory, collegiate, and musical departments are maintained. The entrance requirements are fifteen units. The degrees of A.B. and B.S. are conferred. The enrollment in 1910-1911 was 451 in all departments.

MONOMANIA.—See ABNORMALITY.

MONROE, LEWIS BAXTER (1825-1879).—Author of a series of school books and professor of elocution. He was educated in the common schools of Massachusetts and at the Castleton (Vt.) Academy. He taught in the public schools of Massachusetts and New Hampshire, organized a school of elocution and oratory in Boston, and was professor of elocution in Boston University. He pub-

lished a series of school readers and spellers and numerous works on elocution. W. S. M.

MONTAIGNE, MICHEL EYQUEM DE (1533-1592).—French essayist, moralist, educational theorist, and man of affairs. A student of law, courtier, councillor in the Bordeaux parliament, and twice mayor of Bordeaux, his claim to renown rests upon his essays. Although his ideas upon education are found scattered through many of his essays, the particular one entitled *Concerning the Education of Children* contains his chief contribution in the field of educational theory. While Montaigne has points in common with Rabelais, Bacon, Comenius, and Rousseau, it is by no means easy to classify him as an educational theorist. Dr. Monroe's expression "social-realist" is probably the most satisfactory to apply to him. His appreciation of the significance of the educational problem is expressed in his own words: "The greatest difficulty with human learning seems to be in the field where it treats the care and instruction of children." One of his most pregnant and oft-quoted comments on education is the following: "To know by heart is not to know at all; it is merely to retain what one has entrusted to his memory." He is seeking rather training of the judgment than mere "bookish education," as he characterizes it. The first edition of the *Essays* appeared in 1580. Of the modern editions that of Courbet et Roger (Paris, 1872-1900) is probably the best.

MONTANA STATE COLLEGE OF AGRICULTURE AND MECHANIC ARTS, BOZEMAN, MONT.—An institution established in 1893, in pursuance of the Morrill Acts, by the legislature of Montana. College courses leading to degrees are offered in divisions of agriculture, engineering, and science, which includes home science. In addition, there are courses not leading to degrees in the schools of agriculture, pharmacy, art, music, preparatory, and other special courses. An experimental station is also maintained. The entrance requirements to the college courses are fifteen units. The enrollment in 1911-1912 was 595. The faculty numbers forty-four members.

MONTANA, STATE OF.—First organized as a territory in 1864, and admitted to the Union in 1889 as the forty-first state. It is located in the Western Mountain Division, and has a land area of 146,201 square miles. In size it is about three times as large as the state of New York, larger than Prussia, and nearly as large as California. For administrative purposes the state is divided into twenty-eight counties, and these in turn into school districts. In 1910 Montana had a total population of 376,053, and a density of population of 2.6 per square mile.

Educational History.—The first school report was made in 1868, though never printed. This showed a total of 2000 children, 25 school districts, 15 schoolhouses, and 27 teachers in the territory. The series of printed annual reports begins with 1879, at which time the school system had grown to 130 districts, 119 schoolhouses, and 161 teachers. The revised school law of 1879 contained the essential outlines of that in use at present. One provision of the law required separate schools for negroes, though there must have been very few in the territory at the time. In 1881 the first uniform textbook law was enacted, providing for a uniform series of textbooks, to be adopted for four-year periods. In 1882 the Territorial Teachers' Association held its first meeting. In 1883 a permissive town and city library law, with a permissive library tax, and the first compulsory education law, were enacted. In 1885, at the time of the new textbook adoptions, a Territorial Textbook Commission was created. In 1886 Congress passed the temperance physiology bill, making such instruction mandatory in all the territories. In 1889 a uniform course of study for all of the schools of the territory was first issued.

In February, 1889, the enabling act was passed by Congress, a constitution was adopted in August, and the territory was admitted as a state in November of that year. At this time there were 344 school districts, 419 schoolhouses, and 507 teachers in the new state. The new constitution made definite provision for "a general, uniform, and thorough system of free schools" for the state; provided for the election of a State Superintendent of Public Instruction, for four-year terms, and county superintendents of schools for two-year terms; made women eligible for any district or county school office; defined the public school fund, provided for additions to it, and for the apportionment of the net income on the census basis; authorized taxation for education; prohibited local and special laws for schools, any aid to sectarian or private schools, religious or partisan tests or instruction, and any discrimination at the university on the basis of sex; created a State Board of Education, to which was given the control of all of the state higher and special institutions, and a State Board of Land Commissioners to look after, lease, and sell

the school and other educational lands; exempted school and library property from taxation, limited school district indebtedness to 3 per cent, and provided that district school elections must be held at a different time from state and county elections. The Code Commission, in 1891, proposed a new school law for the state.

In 1893 the State Board of Education, provided for in the constitution, was created by law, and the establishment of the State University at Missoula, the State Agricultural and Mechanical College at Bozeman, the State School of Mines at Butte, and the State Normal School at Dillon, were authorized. In 1895 a recodification and revision of the school law was adopted by the legislature, to which only minor amendments have since been made. The law of 1895 does not differ greatly from the old law of 1879. A school library law was also enacted. In 1897 the state textbook law was revised to provide for six-year adoptions, and optional free textbooks for any districts voting to provide them. In 1899 the free county high school law was enacted. In 1903 the old compulsory education law, which had remained almost a dead letter for twenty years, was revised and strengthened, the education of poor children was provided for, and industrial schools, for the better enforcement of the law, were authorized. In 1909 the State Board of Education was given somewhat larger authority in the management of the state institutions, and instruction as to dangerous and communicable diseases was required in the schools. In 1911 graduates of the University of Montana, when recommended by the university, were to receive five-year high school teachers' certificates, exchangeable after twenty-seven months of teaching in the state for life diplomas. An Educational Commission to revise and codify the school laws was created in 1911; and a bill requiring elementary manual training in all grades, manual training in the upper grammar grades in all large towns, and direct vocational training in the cities, with state aid of \$10 per year per pupil attending such courses, was adopted.

Present School System.—At the head of the present school system of Montana is a State Board of Education and a State Superintendent of Public Instruction. The State Board of Education consists of the Governor, State Superintendent, and Attorney-General, *ex officio*, and eight others appointed by the Governor with the concurrence of the Senate. They are appointed for four-year terms, two being appointed each year. This board possesses rather unusual powers in that it has supervisory control and acts as a Board of Regents for all of the higher and special state institutions (university; agricultural and mechanical college; school of mines; state normal schools; orphans' home; reform school; and state school for the deaf, blind,

and feeble-minded), as well as acting as a State Board of Education in the usual sense for the schools of the state. Acting as a board of control for the higher and special institutions, it appoints the president and faculty of each; grants all degrees and diplomas, as recommended by the different faculties; controls the land funds, and the general expenses of each; adopts rules and regulations for their government, and appoints an executive committee of three to manage each institution, and to report back to the board. Acting as a State Board of Education it adopts rules and regulations, not inconsistent with law, for the administration of the schools of the state; grants state certificates and life diplomas to teachers; appoints and commissions experienced teachers to act as institute conductors; and may accredit other institutions (colleges and normal schools) within or without the state. A State Board of Land Commissioners, consisting of the Governor, State Superintendent, Secretary of State, and Attorney-General, has control of the leasing and sale of the university, school, and other educational lands of the state, and the investment of the accumulated funds. A State Textbook Commission, consisting of seven persons appointed by the Governor for five-year periods, five of whom must be experienced educators, adopts a series of uniform textbooks for the schools of the state, for five-year periods, and contracts with the publishers for the same.

The State Superintendent of Public Instruction is elected by the people for four-year terms. He must hold the highest grade of Montana state teachers' certificate, or be a graduate of a university, college, or normal school. He is paid a salary of \$3000. Except as specified for the State Board of Education, he has general supervision of all of the schools of the state; preserves all records, and furnishes all blanks; keeps a record of all of his official acts; prepares lists of books suitable for school libraries, and prescribes rules and regulations for their government; prepares all questions for the examinations for teachers' certificates, makes rules and regulations for the management of the same, and for cause may revoke state or life diplomas; prepares and publishes a course of study for the schools of the state; issues rules and regulations for the holding of teachers' institutes, and visits the same; advises county superintendents, hears and decides appeals, and makes rules and regulations governing appeal cases; apportions the school fund to the counties; and makes a biennial report to the Governor.

For each county there is a county superintendent of schools, elected by the people for two-year terms. Women are eligible for this office, and nearly all of the positions are held by them. Each county superintendent has general supervision of the schools of the county, under the direction of the State Superintendent;

must visit each school at least once a year, and advise with teachers and trustees; decides district controversies; administers oaths to all subordinate officials; apportions the school money to the districts; selects institute instructors, from a list submitted by the State Board of Education; presides at the county institutes; may issue temporary teachers' certificates, on evidence of fitness; keeps a record of all district boundaries, and may adjust them; acts as one of a board of trustees for any county high school established; makes an annual report to the State Superintendent; and acts as a member of the county board of examiners. The other two members of this board are appointed by the county commissioners, and must hold high-grade teachers' certificates, or be graduates of a normal school or college. The board conducts all examinations within the county for teachers' certificates, and all examinations for graduation from the eighth grade.

Each county is divided into a number of school districts, for each of which a board of school trustees is elected. Three classes of districts exist, according to population, with from three trustees in all districts having less than 1000 to seven in cities of over 8000. The school election takes place at the schoolhouse the first Saturday in April, and women may vote and are eligible for the office. Vacancies are filled by the county superintendent, by appointment. New districts may be formed when ten or more children are over two miles from a schoolhouse. Each board must follow the instructions of the State Superintendent; see that the schools are taught in the English language; employ teachers for the schools; repair, insure, and care for the schoolhouse; may suspend, expel, or exclude undesirable children; must supply books to indigents, and, on vote of the district, must supply free textbooks; may add additional branches of instruction, may establish kindergartens and a high school, and may grade the school into departments; and must make an annual report to the county superintendent. If their funds exceed \$25,000, they must print a financial report, and if a less sum, the clerk must make a financial statement annually. If deemed best, trustees may close a school and transport the children to another school, paying tuition for them. An annual school census must be taken by the clerk of each district. From 5 to 10 per cent of the county school fund must be spent each year for school libraries, which are to be kept in the schoolhouse, and their condition reported annually to the county superintendent. Cities of 4000 population may employ a city superintendent, for four-year terms.

School Support. — Montana received 5,112,035 acres of land from the sixteenth and thirty-sixth section grants. As late as 1908 some 2,000,000 acres were as yet unsurveyed,

and about 1,500,000 acres were under lease. The permanent fund at present amounts to about \$6,000,000. A number of miscellaneous sources of income are specified to be added to the fund. The income from this fund is apportioned to the counties on the basis of the school census. The County Commissioners of each county must levy a four-mill county tax, which, with the net proceeds of fines, is added to the state school money and apportioned to the different districts on census also. Any district board may levy up to ten mills for maintenance, and in first and second class districts (over 1000 population) up to an amount sufficient to maintain a nine months' school. After an eight months' school has been maintained, if the district so votes, surplus funds may be used for building purposes. County high schools may levy a county tax up to three mills for maintenance, and up to ten mills, if erecting a building. The county treasurer is the custodian of all funds for all kinds of districts, paying out the funds only on orders from the district school authorities.

In addition to common school lands, the state also received two townships of land (46,080 acres) for a state university, and 90,000 acres for an agricultural college. At the time of its admission as a state Montana also received further special grants of 50,000 acres for the agricultural college, 100,000 acres for the school of mines, 100,000 acres for the normal school, 50,000 acres for the reform school, and 50,000 acres for the school for the deaf and dumb.

Educational Conditions.—Considering the sparse population, educational conditions in the state are very good. The population is about 70 per cent native, 95.9 per cent white, and less than 1 per cent negro. The remainder is Oriental, mostly Chinese. The schools are well supported, and the per capita expenditure is very high. About 30 per cent of the districts supply free textbooks. The school libraries average over 100 volumes to the building. The schoolhouses are good, averaging about \$3500 in value. More than one half of the counties have established county high schools, and a number of district high schools are maintained. So much have the high schools developed within recent years that the university has been able to dispense with its preparatory department. There are as yet only about 1000 school districts in the state, and trustees often live twenty miles apart. The school term throughout the state averages nearly eight months (7.9), and nine months in the cities and towns. The state has a fairly good compulsory education law, but the machinery for enforcing it is weak. Teachers in private and parochial schools must cooperate in enforcing the law, and private schools must make reports to the public school authorities. No distinctions based on race or color are allowed.

Teachers and Training.—The state employed 2250 teachers in 1910, of whom 12 per cent were men, 11 per cent were college graduates, and 26 per cent were normal school graduates. The salaries paid were fairly good, averaging about \$900 for men and \$600 for women. For the training of teachers the state maintains a good state normal school at Dillon, and graduates of the university may also be certificated, if they have taken the required work in education. The state is very liberal in the matter of accrediting normal schools and colleges in other states, as well as the state certificates and diplomas possessed by new teachers coming to the state. This has enabled the state to attract to it many well-trained Eastern teachers. A county teachers' institute of from three to ten days is held each year, and all teachers except high school teachers are required to attend. They receive full pay while attending. The amount to be expended for the institute varies, in different counties, from \$100 to \$300.

Four grades of teachers' certificates are issued on county examinations, based on questions prepared by the State Superintendent. The examinations form a good graded series, and in granting certificates the county superintendent and the examiners are authorized to take into consideration the candidate's teaching experience and success, as well as aptness, knowledge, and personal character. High school teachers and principals of schools of three or more teachers must hold the highest grade of county certificate or a state certificate, or be graduates of a university, college, or normal school. The two highest grades of certificates are valid in any county. Normal school and university graduates may be certified without examination. State diplomas and life diplomas are granted by the State Board of Education, and these involve still further advanced examinations.

Higher and Special Education.—The University of Montana, at Missoula, opened in 1895; the Montana College of Agriculture and Mechanical Arts, at Bozeman, opened in 1893; and the Montana State School of Mines, at Butte, opened in 1900, stand as the culmination of the public school system of the state. The state also maintains a number of experimental substations in horticulture and agriculture. The Montana Wesleyan University, at Helena (M.E.) organized in 1888 and opened in 1890, and the College of Montana (Presby.), at Deer Lodge, organized in 1878, are the only other institutions of collegiate rank in the state.

The state also maintains the State Orphans' Home, at Twin Bridges (a state home and public school for orphans, foundlings, and destitute children); the Montana School for the Deaf, Blind, and Feeble-Minded, at Boulder; and the Montana State Reform School, at Miles City.

MONTANA STATE SCHOOL OF MINES, BUTTE, MONT.—A state institution provided for in the enabling act of 1889. It is maintained by biennial appropriations made by the legislative assembly. Fifteen units are required for admission to the courses, which are purely technical and lead to the degree of Mining Engineer. The enrollment in 1910-1911 was fifty-nine. There is a teaching staff of eight members.

MONTANA, UNIVERSITY OF, MISSOULA, MONT.—A coeducational institution founded in 1893 by legislative act and placed under the State Board of Education. The university was opened in 1895. There is a campus of forty acres, and at present there are six buildings used for instructional and other purposes. The university is maintained by the income from a university fund, annual appropriations, tuition and matriculation fees, and public and private contributions. The requirements for entrance are fifteen units, two of which may be carried over under conditions for one year. The degrees of B.A., B.S., and B.S. in Engineering with the corresponding master's degrees are conferred after the completion of the appropriate courses. The university has power to grant legally recognized certificates of qualification to teachers. The enrollment in 1910-1911 was 220 students, and the faculty consisted of twenty-seven members.

MONTESSORI METHOD, THE.—This method of teaching children of the kindergarten or early primary school age is the work of Dr. Maria Montessori of Rome. For several years prior to 1900, Dr. Montessori was assistant at the Psychiatric Clinic in the University of Rome. This position brought her in close touch with the defective children who were at that time confined in the insane asylums. Thus it was that she became a close student of the methods of Itard and Séguin. Guided by the work of these two men, she devised a large amount of didactic material and began the teaching of these unfortunates. The results were so satisfactory that these children were able to pass the examinations required of the Roman children in the elementary schools. These positive results brought her to the attention of the school authorities, and she was invited to deliver lectures before the teachers of Rome. Eventually these lectures led to the formation of an institute which continued under her direction for several years.

It was a conviction with Dr. Montessori that methods which were so effective with

defectives would be correspondingly effective with normal children. The opportunity to try the method with normal children came when the Director General of the Roman Association for Good Building invited Dr. Montessori to organize infant schools in some of the model tenements which the Association owned. These tenements were for the most part located in the poorest parts of Rome. Each was built about a court and occupied an entire block. Rooms opening out into this court were set apart for schoolrooms, and these were furnished in accordance with Dr. Montessori's plans. There was little of the conventional school equipment. Small tables and chairs took the place of the fixed desks and seats. The didactic material which had been used with the deficient was modified and here took the place of the usual kindergarten and elementary school apparatus. The schools were called the *Casa dei Bambini*, or The Children's Houses. The first one was opened in January, 1907. The methods which were used in these schools have been adopted by many of the schools in Italy and Switzerland and in several of the larger cities elsewhere.

The essentials of the system advocated by Dr. Montessori may be considered under two general headings. The first is a strong emphasis on sense training. This sense training is first of all for general development. For this purpose there are many different pieces of apparatus designed to train the several senses. In order that the child may gain perception of form, there are various wooden insets similar to those used by Itard and Séguin. The child learns to recognize the form by passing the fingers around the edges of the insets and then putting them in their proper places. Perception of dimensions is secured through the use of blocks in which cylinders of various dimensions are set in holes. There are also blocks of various sizes from which the child may make stairs, thus gaining a perception of size and length. Perception of color is secured by using silk bobbins of different colors and shades. In each case the material is so planned that the child may correct his own errors. If he fails to put the cylinders in the proper holes, he cannot get all of them in. If he does not place the blocks in proper order, they do not make stairs. Some of the material is planned to serve as a preparation for the school arts. Letters cut from sandpaper are pasted on cards. The children by passing their first two fingers over these are supposed to gain such muscular control that they are better able both to write the letter and to associate the sound. Other letters are cut from cards, and with these the children build up words and sentences.

In addition to this somewhat formal sense training for general development, there is a large amount of incidental sense training which is gained through such activities as

buttoning and lacing cloth or leather fastened on frames. Further, the courts or gardens connected with these schools are also used in training children to observe flowers and plants as well as birds and small animals kept as pets.

The second essential feature of the Montessori method is the great stress laid on the freedom of the child. This means that the teacher is expected to observe and direct the activities of the children rather than to control them. To accomplish this the teachers or directors are expected to measure the child's growth, record any significant fact regarding his development, and at different times test his advancement in order that they may know how best to deal with him. The large degree of freedom allowed and the individual treatment are features which differentiate these schools markedly from what one customarily finds elsewhere. This principle of freedom is carried out in the theory of discipline. The materials and exercises are of such a nature that the child is led to correct himself. If, in moving about, the child upsets a chair, the noise at once makes him understand what his error has been, and it is expected that the annoyance to others will cause him to avoid such mistakes in the future. In this way self-control is to be secured. As so far used the method has been applied only to children of the kindergarten and early elementary school age. There is promise, however, of experimentation looking to its extension into higher grades.

MONTESQUIEU, CHARLES LOUIS DE SECONDAT, BARON DE LA BRIDE ET DE (1689-1755).—French philosopher, statesman, and scholar. He was educated at the Oratorian school at Juilly, and served as counselor in the parliament of Bordeaux for twelve years, the last ten years as president. Subsequently removing to Paris, he was elected a member of the French Academy (1728). His principal writings are: *Lettres persanes* (Amsterdam, 1721); *Considérations sur les causes de la grandeur et de la décadence des Romains* (Amsterdam, 1734); *L'esprit des lois* (Genève, 1748). Book IV of the last work contains several chapters on education, one of the striking statements found therein, though it is by no means peculiar to Montesquieu, being: "The laws of education vary as the government"—a truth that gives us the keynote to the kaleidoscopic transformation in the educational system of France during the revolutionary period, and that goes far toward explaining the different national educational ideals.

MONTPELLIER, UNIVERSITY OF, FRANCE.—One of the earliest of the medieval universities, a medical school being referred to in 1137. It is doubtful how the institution originated, but it is certain that the population was mixed, and Saracen, Arabic, or Jewish influences may have been strong, although this view is balanced by the great power which the Church always enjoyed. The medical school was certainly free and unrestricted about 1180, but the organization of other universities was soon imitated, but side by side with the strong gild principle went the authority of the Bishop of Maguelone. The earliest definite mention of a university at Montpellier is found in statutes of 1230, when a chancellor is nominated by the bishop. The growing democratization of the student body led to constant opposition to episcopal authority, which was only settled in 1340. The Montpellier medical school was for long the center of the cult of Hippocrates and Galen. The study of law, civil and canon, was also pursued at Montpellier from the twelfth century, and before a university is heard of, well-known jurists like Placentius (author of a *Summa Codicis* and *Summa Institutionum*) and Bassianus taught there and intimate relations were maintained with Bologna. A *Studium Generale* was formally established in 1289, and, as in the medical school, a struggle went on between the bishop and the *studium* until an arrangement was reached about 1340. In 1421 the faculty of theology, which subject had been studied in connection with the Carthusian monastery, was added to that of law, while the faculty of arts which had existed certainly since 1242 was also attached to the legal faculty. For many reasons—war, plague, and the rise of the university at Perpignan—Montpellier declined in the fourteenth century. The medical faculty, however, enjoyed a renewed period of prosperity as a result of the Renaissance and the revived interest in Hippocrates and Galen (Rabelais, *q.v.*, lectured there on the former) and through the patronage of Henry IV and the excellent work in surgery it acquired a considerable reputation. In 1572 a college of pharmacy was established in the town. In 1593 a botanical garden was laid out, and the first chair in botany was established in 1597. In the seventeenth century chairs were founded in chemistry, physics, mathematics and hydrography, and French law. The arts school was under the control of the Jesuits from 1629 to 1762. During the Revolu-

tion the university with the exception of the medical school suffered the same fate as the other higher institutions. With the reorganization effected in 1808 separate faculties of science and letters were established; the medical faculty had been reorganized in 1803; in 1840 the school of pharmacy became a part of the university; in 1878 a faculty of law was revived. Other institutions connected with the university or located in the town are an agricultural school, a forestry laboratory, a meteorological laboratory, a school of commerce, a school of fine arts, a conservatory of music, and an institute of historical science. Special provision is made for foreign students to study the French language, literature, history, and national institutions. The student enrollment in 1909-1910 was 1958 (law, 744; science, 282; letters, 134; medicine and pharmacy, 798).

MONUMENTA GERMANIÆ PÆDAGOGICA. — A comprehensive publication modeled on the *Monumenta Germaniæ Historica*. The work was conceived by Dr. Karl Kehrbach, and is now published under the auspices of the *Gesellschaft für deutsche Erziehungs- und Schulgeschichte*, founded by Kehrbach in 1890. As originally planned the work was to cover all aspects of education in German-speaking countries from the humanistic period. On further consideration it was decided to begin with the early medieval period. The first volume appeared in 1890. The work deals with education in its broadest sense. It is divided into four departments: (1) School ordinances (church, state, and municipal), including school regulations, visitations, constitutions of orders, letters of appointment, synodal acts, and salary scheme, oaths of office, statutes of hostels, dormitories, etc. (2) School textbooks (3) Educational treatises and systems; biographies; school addresses; table manners; regulations for education, poems dealing with education, and colloquies; correspondence of schoolmen; school plays. (4) Dissertations dealing with the place of the above in education. The school ordinances are treated from historical, bibliographical, and textual viewpoints; the textbooks from the viewpoints of subject matter and history, pedagogy, text, and bibliography. The work is necessarily not published at regular intervals or in any defined order. Up to the present there have appeared forty-eight volumes, the general contents of which are given in the following list:—

- Volume I, VIII. Brunswick School Ordinances up to 1828.
 Volume II, V, IX, XVI. Ratio Studiorum et Institutiones scholasticæ societatis Jesu per Germaniam olim vigentes.
 Volume III. History of Mathematical Instruction in Germany up to 1525.
 Volume IV. German Catechisms of the Moravian Brethren.
 Volume VI, XIII. The Transylvanian-Saxony School Ordinances.
 Volume VII. Philip Melancthon as Preceptor of Germany.
 Volume X, XI, XV, XVII, XVIII. History of Military Education and Training in German-speaking Countries.
 Volume XII. *The Doctrinale* of Alexander de Villa Dei.
 Volume XIV. History of Education of the Bavarian Wittelsbachs up to 1750.
 Volume XIX. History of Education under the Wittelsbachs of the Palatinate.
 Volume XX, XXIII, XXXIX. Evangelical Catechisms before Luther's *Enchiridion*.
 Volume XXIV. School Ordinances of Baden.
 Volume XXV, XXIX, XXXI. Pestalozzi Bibliography.
 Volume XXVI, XXXII. The Educational Reform of Comenius in Germany up to the End of the seventeenth Century.
 Volume XXVII, XXVIII, XXXII. School Ordinances of the Grand-Duchy of Hesse.
 Volume XXX. Austrian Education at the Time of Maria Theresa.
 Volume XXXIV. Youth and Education of the Electoral Princes of Brandenburg and the Kings of Prussia.
 Volume XXXV. Commercial Education in Berlin in the Eighteenth Century.
 Volume XXXVI, XXXVII, XL. Youth of Frederick William IV of Prussia and of Emperor and King William I.
 Volume XXXVIII, XLIV, XLV. Education in the Grand-Duchies of Mecklenburg-Schwerin and Stralitz.
 Volume XLI, XLII. Documents on Secondary Education in Bavaria, including Regensburg.
 Volume XLIII. Andrea Guarneri's *Bellum Grammaticale* and its Imitators.
 Volume XLVI, XLVIII. Higher Education in Prussia under the Superior School Council (1787-1806) and the Abiturientenexamen.
 Volume XLVII. Documents on the History of the Humanistic Schools in the Bavarian Palatinate.

MOOD. — The general emotional tone of one's consciousness is sometimes pleasurable or unpleasurable for a considerable period of time. Under such circumstances, the individual is said to be in a pleasurable or unpleasurable mood, as the case may be. The mood does not consist in a single emotion, but rather in a persistence of a general type of emotional attitude. On the other hand, mood is to be contrasted with temperament as a relatively transient phase of experience. A person who is of a sanguine temperament will continue day after day to be in an optimistic state of mind. One may have an optimistic mood for a period of time without having the general temperament characteristic of the optimist. The control and education of an individual so that his mood may be developed into a permanent temperament is desirable, provided the mood is of a favorable type.

For a discussion of this topic, see EMOTIONS.

MOOR'S INDIAN CHARITY SCHOOL.

— The name given by Rev. Eleazer Wheelock to his Indian school, which he opened in 1754, in recognition of a bequest by Mr. Joshua Moor of Mansfield, Conn. The school was first established at Lebanon, Conn., and in 1785 was moved to Hanover. When the institution was chartered as Dartmouth College, the education of Indians gradually became secondary, the school being chartered as a separate institution in 1807. It continued until 1849.

See DARTMOUTH COLLEGE; INDIANS, EDUCATION OF.

MOORE, ZEPHANIAH SWIFT (1700-1823). — College president. He was graduated from Dartmouth College in 1793; was for thirteen years pastor of a church at Leicester, Mass.; four years professor at Dartmouth College (1811-1815); six years president of Williams College (1815-1821); and two years president of Amherst College (1821-1823).

W. S. M.

MOORES HILL COLLEGE, MOORES HILL, IND.

— A coeducational institution founded in 1853 and opened in 1856 under the auspices of the Methodist Episcopal Church. There are maintained an academic, collegiate, agricultural, commercial, music, and art department. The college entrance requirements are sixteen units. Classical, scientific, and literary courses are offered, leading to their respective degrees. The enrollment in 1911-1912 was 270. The faculty numbers twenty-one members.

MORAL CHARACTER. — See CHARACTER.

MORAL EDUCATION. — The problem of moral education in the schools is very complicated. First of all, the present status of the teaching of morals is the result of a long and varied history, the phases of which are reflected in many of the problems of to-day. Again, the nature of the moral sense, and the relation of morality to the general aim of education are both matters upon which a variety of opinions are held. These different views have given us antithetic practices, and to-day the educational world cannot be said to show any marked agreement as to the general place of morality in the educational scheme, the method of moral culture, or the subject matter of moral instruction. An exposition of the situation at present in regard to moral education requires as an introduction a consideration both of the main trend in the history of moral culture and of the various philosophical and psychological theories concerning the development of the moral sense.

Four Historic Movements in regard to Moral Culture. — The history of moral culture presents among others four issues which

are to-day especially fruitful of difficulties to the school that engages in this task. These issues concern (1) the progress from customary to reflective morality, (2) the association of morality with religion, (3) the evolution of academic from utilitarian morality, (4) the variety in moral standards among different peoples and in different ages.

(1) In primitive society morality is wholly a matter of custom. Indeed, the word "morality" is derived from *mores*, or customs. These mores controlled the moral sense of early man. Even to-day they are, perhaps, the dominant factor in the moral life. Whatever is in the mores, the sociologist Sumner declares, is felt to be right. These customs constitute the social adaptations that society has established as a result of blind and uncomprehended experimentation. However, with the progress of time men get a wider outlook, which reveals to them the mechanical foundations of much that had seemed like the sacred utterance of an inner voice. Some mores come in conflict with others as people migrate and get into contact with strangers. Other mores are outgrown, and history preserves for our amazed study the intense moral allegiance of our forefathers to practices toward which we feel only indifference or contempt. Thus man advances toward an age in which morality is no longer merely a matter of the mores, but seeks a rational foundation in some universal laws of social and individual life.

Morality tends to become reflective by yet another process. The mores find substantial help in such specific instruction as can be added to supplement the cultural effect of imitation. This instruction tends to become generalized in rules of practice. These are at first mere summations of existing mores, but with the progress of time they come to include reasons and to strive to reconcile inconsistencies that are laid bare as various principles are drawn into a system. Thus instruction in morality constantly tends to make it reflective, critical.

But the tendency to make morality reflective weakens the implicit faith in the mores. What is consecrated by habit and feeling is desecrated by reason. Habituation in the mores, which we may call moral training, and reflective criticism of them, which is almost a necessary implication of moral instruction, do not always support each other. In this emergency we find a gradual differentiation of two parties. One consists of those who reverence the mores and would limit moral culture to habituation in them, possibly supplementing this by such dogmatic instruction as can be made to strengthen their grip on conduct. The other comprises those who would make all morality of the reflective critical type. Such was the view of Socrates and of Plato in his earlier years. Their notion that virtue is knowledge, and can be taught, may be regarded as essentially an abandonment of the mores in favor

of a reasoned course of conduct. There is yet a third party, in which we may group those who hold, as did St. Paul, that we may know the better, yet do the worse. On this view, while morality should be based on reflection, it must be ingrained in character before it becomes effective. This result can be reached only by habituation, by will. Thus moral training is again invoked, not as the basis of the moral life, but as the only agency by which the dictates of reason and conscience can be put into practice.

It is evident that these various points of view are implicated in the attitudes taken to-day toward moral instruction in the schools. Those who feel that morality is a matter of the mores, if they want moral culture in the schools, have in mind, as the substance of this, habituating training plus a little instruction preceptive in character. Some, however, think that this dogmatic instruction will take the spirit out of the habits that it is designed to aid. They hold that moral culture should be indirect; that we get it best by growing into it, rather than by having it preached to us; that to state in rules the principles that should constantly be exemplified in habits is to deal in platitudes. There is life in such precepts when we live them, not when we merely talk about them.

On the other hand, those who would found morality on reflection may hold that it is beyond the reach of children, and so exclude it from the studies of the elementary schools; or if they have a more favorable notion of the capacity of the child, they may wish the classes seriously to discuss the vital problems that constitute mooted issues in the life of the day. It is evident that instruction in morals does not go far before it reaches the plane of reflective morality, and that this is critical, interested only in that which is not yet a matter of habit or in that habit which is questionable. It tends to disintegrate and to reconstruct the mores. Otherwise it has little ground for being.

(2) The association of religion with morals is very largely responsible for the situation to-day in reference to moral instruction. In the very beginning of conscious endeavors to supplement the mores by direct teaching, religion played a prominent part. The customs that society was most anxious to emphasize involved as a rule individual self-restraint, often individual sacrifice for community welfare. In making a conscious appeal on behalf of such mores the belief in the supernatural was of the greatest help. Instruction appeals here, as always, to the reason, but to a reason uncritical of the products of its imagination. In religion instruction found something new and fresh that could be used to reinforce the mores rather than to cause one to grow weary or skeptical of them. Moral instruction in the guise of religion can interest and inspire. The mind is lured away from the commonplaces of everyday life and invited to speculate about the

rewards and punishments of the invisible powers that preside over the destiny of man. The glory and the terror of such unexplored experiences are a never failing stimulus to the imagination.

In modern times the struggle over freedom in religious matters has resulted in the removal of much or all religious instruction from the national schools in democratic communities (see RELIGIOUS EDUCATION). The historic association of moral and religious instruction has caused the latter to carry the former with it out of the curriculum. France after the Revolution and the United States illustrate this tendency best among the larger states. In many cases such religious organizations as possessed a more or less adequate system of schools under their own control resisted the development of the national schools, holding them to be Godless institutions, calculated to sharpen the wits rather than to cultivate the conscience. It has even been urged that non-sectarian education produces crime, and in proof thereof shown that the amount of crime as indicated by the statistics increased with the development of state schools. A more careful examination of the data made clear, however, that the apparent increase of crime was due to the addition of new causes of arrest, such as drunkenness, or to the more accurate keeping of records of arrests, or to the greater vigilance of the officers of the law. In point of fact, the data seem to indicate that education, even though it does not include specific moral instruction, tends to reduce crime by increasing efficiency, and so diminishing in a measure the incentive to crime.

However this may be, there has seemed much reason to deplore the lack of more positive instruction in morals in the schools. In order to make up this deficiency and yet keep out instruction specifically religious, efforts have been made to develop a system of morals not based on religion. Here some have discredited and maintained the inseparability of the two. Especially in England this view has found many supporters. Since the public elementary system there was until 1870 entirely in the hands of the voluntary associations of either the Church of England or Dissenting Denominations, religion has had in them a prominent place. When schools were later established independently by the public authorities, a little undenominational religious instruction was given in them, and moral teaching was connected with it. In France, where, perhaps, religion has been more completely excluded from state schools than in any other European country, we have the most definite attempt to develop moral instruction independently. The law of 1882 required a certain amount of moral and civic instruction. At the same time, one day a week in addition to Sunday was allowed the children that the parents might, if they would, provide religious

instruction outside the schoolhouse. In Germany religious instruction is regularly given in the state schools by or under the supervision of the pastors of the various churches in the localities. To-day not only Catholics and Protestants, but also Hebrews, have a chance to determine this religious instruction. Moral instruction is closely connected with the religious teaching. The German plan prevails, in general, in Switzerland. In European countries where one denomination is not only the state religion, but is also in control of the situation, the religious and moral instruction in the school centers about the ideas and practices of that denomination. Thus, so far as the connection between religion and morality is concerned, we have five types of schools, as follows: (1) Those schools in which there is neither specific religious instruction nor *set* lessons in morals. Such are most of the public schools in the United States and many of the private schools as well. However, almost, if not quite, invariably the public school regulations in the various states enjoin the teachers to provide *incidental* moral instruction as well as to care constantly for moral training. (2) Those schools that provide no religious instruction, but have developed a special course of study in morals and civics. This type is illustrated in the state schools of France, where, although a general recognition of a Deity is approved, very little, if any, religious instruction is given. (3) Those schools in which undenominational religious instruction has been made a feature of school work, and the moral instruction associated therewith. This method may be said to be that aimed at in the English elementary schools established by the public authorities. The parents may, if they wish, withdraw the children from the periods devoted to religious instruction. (4) Those schools in which religious and at least partially denominational instruction is given under the control of the various denominations in the locality. Here moral teaching springs out of the religious teaching. This system is illustrated in Germany and Switzerland. (5) Those schools in which religious instruction according to one faith is given, and moral instruction made largely dependent thereon. Such a system prevails in the state schools where one faith, as the Roman Catholic or the Lutheran, is in control, or in the schools maintained by the various denominations.

In general, it may be said that moral instruction receives most attention where there is enough religious study to give it large foundations and emphatic attention, as in the denominational schools of the fifth type, or where it is developed independently of religion, as in the schools of the second type. The attempt to make moral instruction dependent upon undenominational religious instruction, or upon such denominational instruction as may be given by officials not in the regular teaching

force, or in periods sharply separated from the rest of the program, does not yield vital results, inasmuch as a broad enough religious basis cannot thus be given to interpenetrate very thoroughly the moral life. In consequence, those who hold that moral instruction should be founded on religion are likely to advocate much more religious teaching in the secular schools, or to propose to base moral instruction largely, if not wholly, on religious agencies outside of the school.

(3) The historic movement from utilitarian to academic morality has been a factor in determining the present nature of the problem of moral education. When men began first to reflect upon the reasons for the prevailing mores, they searched for utilitarian ones. The customs must be upheld, they thought, because only thus can the prosperity of the individual be assured. This springs from the fact that the mores are founded either upon natural law or, as is usually the conception, upon the supposed will of the supernatural powers. Especially such practices as may make for the welfare of society rather than for that of the individual are found to take refuge behind the theory of authorization by a divinity. When, however, long experience reveals no demonstrable connection between self-sacrificing obedience to divine law and personal prosperity as an ultimate reward for such service, men seek another justification for it. They rise from the notion of prudential morality to the Stoic conception of "right for right's sake." They find in conscience the only guide, and regard the conduct that has for its motive hope or fear of consequences as not genuinely moral. If they associate happiness at all with moral conduct, it must spring from the consciousness of duty done rather than from the worldly success thereby achieved.

However, when men reflect further, they may conclude that after all the happiness of the individual is the only justifiable end of moral conduct, that morality is merely the highest sort of prudence. The utilitarian finds his explanation of the altruistic conduct of man in his social nature, which cannot be happy when surrounded by unhappy companions. He would, therefore, make moral education consist largely in the study of consequences and such culture of habits and will as enables one to carry into practice the bidding of the knowledge thus acquired. Here we have the conception of moral culture entertained by Rousseau and Herbert Spencer. The child is to be subjected to the discipline of natural consequences.

Opposed to the utilitarians are the rigorists like Kant, who maintain that morality is a matter of obedience to absolute law and cannot be based on the calculation of consequences. Hence, in their view, moral culture consists not in any revelation of relations between cause and effect to be derived from experience,

but rather in rousing to free utterance an inner voice. On the question of the nature of this inner insight we have the rationalism of Kant opposed to intuitionism. Kant founds morality on reason, — not empirical reason, which investigates consequences, but pure reason, which reveals the right in itself. Such rightness, he holds, consists in conformity to the absolute moral law, the universal categorical imperative. One may act rightly and yet apparently bring disaster to himself and others. True moral culture consists, therefore, in endeavoring to rouse the attitude of good will which considers only the form of the act, and is careless of consequences. The intuitionists hold that the awareness of the right is not even reasoned out, but is a matter of direct perception. To teach morality becomes, on their view, analogous to teaching one to use his eyes. We do not learn a moral law and then apply it, as Kant supposes, but we simply look steadily at what we think of doing, and its rightness or wrongness becomes immediately apparent.

(4) Finally, among the historic facts that have entered in to determine the character of the problem of moral instruction to-day is that of change and variety in the moral codes. The notion that in morality we have something which differs from religion in that there is universal agreement as to its nature and rules is evidently erroneous. Historically the views of mankind in regard to the rightness of acts have changed quite as much as their notions of religion. For example, infanticide and cannibalism and harlotry have been held to be sacred when properly carried on. To-day the common judgment of the enlightened seems to be united in abhorrence of them. Yet many among the so-called enlightened feel no horror at some sorts of infanticide or of sexual intercourse not recognized by law; indeed, they justify them. And while the exceptions to those who to-day concur in regard to these fundamental matters are, perhaps, few, the unanimity in regard to just what is permitted in the matter of the relations of the sexes, just what is involved in veracity or business honesty or intemperance or in proper service to the state or proper regard for parents, for servants, or for charity is certainly very scant. If the school is to keep to the universally recognized in morality, it seems to be confronted with the necessity of dealing only in generalities and platitudes. Among the special bits of ethical instruction to be found in textbooks widely used in the French schools is this in regard to the attitude of children toward parents: "Do not be familiar with them as you are with your companions." The interpretation of this principle by different households, and especially in America, would evidently vary greatly.

Various Views on the Psychology of the Moral Sense. — The problem of moral culture to-day is further complicated by conflicting views as to the psychology of the moral sense. Funda-

mental among the issues involved here is that between those who regard moral development as essentially a negative, inhibitive process and those who hold that it is at bottom positive, constructive. According to the first party moral education is a purging away of original sin, a purification of the spirit from the taint of flesh, a war against selfishness, or a curbing of the brute that we inherit in the interest of the higher civilization of to-day. This control of our baser nature may be conceived to be dependent upon the influence of the rewards and punishments established by the temporal and the spiritual rulers who determine our fortunes here and hereafter, or upon the wisdom that has come to perceive the penalties that nature visits upon those who permit their appetites and passions to control them, or, finally, upon the birth of an inner conscience, a spiritual quality, — the product, perhaps, of Divine Grace, by virtue of which one comes to despise his inferior self. In any event, the function of the teacher is held to consist in the task of getting the lower nature under control. He is a lawgiver, threatening and punishing, a prudent adviser, pointing out the folly of evil ways, or a preacher, shaming the self-indulgent, the dishonest, and the base by exhibiting their shortcomings to themselves and to others.

The advocates of the constructive ideal of moral culture maintain that all, or at any rate most, of the human desires have a function, that the task of self-control is not so much that of suppressing the evil as it is that of encouraging the good. Among the extreme advocates of this view is Rousseau, who held that man is born good and corrupted by education. Hence, with him the ideal education is to let the child alone, for in its natural development will be found the best culture. The more moderate conception is that, while the natural child or man is by no means morally perfect, yet he does have in him the qualities the right development and harmonization of which will make of him an ideal individual. Moral culture should, therefore, aim, not at suppression, but at an harmonious development of all the powers, at self-realization.

In addition to their view that all, or nearly all, the human instincts have a place in the properly trained man, the advocates of the constructive sort of moral culture hold that the control or the suppression of the undesirable can take place only by substituting something better. This substitute can, they think, be found only in the nature of the child. The negative discipline is, therefore, held to be faulty in that, in aiming merely to suppress the undesirable, it leaves to chance or to the undirected impulse of the child the selection of a substitute interest by the ascendancy of which alone control of the objectionable quality is made possible. Inhibitive education at best merely gets rid of an evil without assuring itself that something better takes its place.

A second issue in regard to the psychology of the moral sense is that between those who emphasize freedom and those who hold that cultural influences are essential to morality. The idea of transcendental freedom, advocated by the followers of Kant, led them to minimize the importance of circumstances in the development of morality. Kant's notion was that the one absolutely independent thing about the individual is the moral will. To make it depend upon educative influences seemed to be to take from it its unconditioned character. Herbart, on the contrary, held that from the point of view of the concrete problems of education transcendental freedom is a myth. All education, he asserted, aims at moral character, and to maintain that culture has no reference to the moral will is to deny that the teacher and the school have any serious value. Education, he claimed, should not passively wait for the moral nature to assert itself, but should continually endeavor by the presentation of appropriate experience, which he characterized as an "aesthetic presentation of the world," to stir up many-sided interest and to cultivate that union of judgment with desire which insures a comprehensive, just, and steady will. Both Herbart and Kant agree that morality is a matter of inner insight. To get this, one must have that in his nature which responds to and evaluates the moral situation. Kant, however, does not think that this moral judgment is *a posteriori*, or derived from experience, but rather *a priori*. Experience is moral because we make it so by judging it, and the judgment of conscience is not a result of instruction. Herbart, on the other hand, declares that it is to be evoked only by the continued presentation of phases of experience in reference to which it can express itself. The child becomes moral by constantly beholding and reacting to moral activity in others.

In more recent years this inner response to moral situations which Herbart held to result from familiarity with them has been traced to the ripening of certain instincts. The keener conscience of the older child is thus attributed not to his experience, but to his maturity. As to the character of the instincts that lie back of moral character, there is a difference of opinion. One school revives the conception of Rousseau, who held that up to adolescence the child is purely self-regarding and should be disciplined only through an appeal to his experience of the pleasant and unpleasant consequences of his acts. In the instincts of puberty, the interest in the opposite sex and later in one's children, he found desires that tend to break down the self-centered life and to create broader sympathy and an altruistic moral sense. President G. Stanley Hall agrees with Rousseau in emphasizing adolescence and the parental instincts. According to him the life of ideals is born and reaches its climax in the "storm and stress"

of youth. Kirkpatrick in his *Fundamentals of Child Study* includes among the instincts that have a bearing upon moral development not only the parental, but also the social and regulative instincts. Under the social instinct he ranges fondness for society, love of approbation, sympathy, and altruism. Under the regulative instinct he places the moral instinct proper and the religious instinct. The former he reduces to the tendencies toward self-control and toward evaluating conduct and developing ideals. Altruism, the genuine religious attitude, and the sense of independence and responsibility, he regards as not much in evidence before adolescence. The period before adolescence in his view is, therefore, merely preparatory so far as morality is concerned. The experience, the habits, and the knowledge of objective values to be gained in this preparatory period are, however, regarded by him as of the highest importance.

Morality and the Aim of Education.—An important phase of the theory of moral culture is concerned in the relation of morality to the total aim of education. Liberal education has from time immemorial occupied itself with ethical culture, especially its civic and social phases. But the development of leisure led to phases of culture calculated to minister rather to individual gratification than to social service. In consequence, liberal education came to aim at knowledge and beauty as well as at strictly ethical qualities. Later, the development of unworshiping religions with the attendant emphasis on the spiritual life as compared to the life of sense, led to the elevation of the religious above the moral aim of education. Still later, the Enlightenment of the eighteenth century found in personality its supreme concept. The struggle for the rights of the individual, for freedom, for self-realization, displayed itself in all phases of human life, — political, social, economic, artistic, and educational. In education the ruling notion of self-realization tended to draw all liberal culture into a unity. The religious, the scientific, the social, and the aesthetic interests were held to be mutually dependent phases of a developing personality. The goal of such development Herbart found in moral character, which to him meant volition controlled by the broadest insight into and sympathy with the various interests of men. In his system, therefore, morality is so broadly interpreted as to be restored to its ancient position as the sole aim of liberal culture.

The Herbartians regarded history, or the account of the human will in action, as the fundamental subject for the development of moral character. With it was closely associated literature. Science and mathematics and, indeed, all the subjects of the liberal curriculum were held to have an ethical bearing, and to justify their place therein because of this fact. Moral instruction, therefore, comes

to consist not in certain rules of conduct taught in connection with religion or separated from the rest of the course of study, but in all the studies of the school. It is their essence. Similarly, moral training was regarded as the whole of the discipline of the school.

The Herbartian conception united in the notion of moral culture all the various historic aims of liberal education. However, it held to aristocratic traditions in excluding the vocation from the liberal ideal. Thus vocational instruction was not regarded by Herbart as an essential phase of moral culture. The democratic and industrial movements of the nineteenth century have brought preparation for the calling forward as an indispensable factor in education. Those who agree with Herbart in regarding vocational education as not aiming at moral character, and at the same time sympathize with the modern demand for training to make a livelihood, are compelled to enlarge his statement of the educational ideal. The expression, efficiency, or in Spencer's phrase "preparation for complete living," has been the most generally current symbol for the aim of education. The extent to which human efficiency is a matter of social adaptation has led this ideal to be characterized as social efficiency. Put in this form, it is capable of a moral interpretation. If morality is character in action in a social environment, then social efficiency must be held to be an essentially moral aim. Indeed, Professor Dewey, in finding moral education to consist in making instruction live in the activities of the child, has defined it broadly enough to make it include all sound education. Culture that is the union of thought and action in a social world which reproduces the essential problems of human life and gradually approximates to the social environment of the adult is evidently both moral and vocational. Just as Herbart enlarged the notion of moral character to include all the products of liberal education, so our modern democratic education would seem to be widening it to embrace the vocational efficiency so much demanded to-day.

Present Agitation in Regard to Moral Education. — The issue of moral education is to-day rapidly forging to the front as one of the leading problems of the school. In France since 1882 specific moral instruction has taken a place in the curriculum. It must be said, however, that this has not always seemed either to French or to foreign observers entirely satisfactory. Especially has it been attacked by the clergy. Since the suppression of the religious associations and the consequent disappearance of nearly all the Catholic schools, the question of the adequacy of the moral instruction received by the French children has been very much in the foreground. In England the issue of moral instruction has also become prominent, stirred up especially by the struggle over denominational control in elementary education.

A commission on moral instruction and training, self-constituted, but containing many of the leaders in education, published in 1908 and 1909 an extensive and valuable report on conditions and opinions in reference to this matter in many countries. In the United States for many years the need of more attention to moral education has been discussed. In the convention of the National Educational Association held in Los Angeles, Cal., in 1907 a resolution was passed to the effect that "It is the duty of the teachers to enter at once upon a systematic course of instruction, which shall embrace not only a broader patriotism, but a more extended course of moral instruction, especially in regard to the rights and duties of citizenship, the right of property, and the security and sacredness of human life." A committee was appointed which made in 1908 and again in 1909 reports on various aspects of moral culture. At the latter meeting certain papers recommended special instruction in morals as part of the curriculum. The idea that this should take the form, not of dogmatic precepts, but of a rational attack on living issues with the aim of developing conscience through reflection was put forth. Experimental efforts in this direction have been made, as, for example, in the course designed by Professor Sharp of the University of Wisconsin, and tried in some of the high schools of that state, in the illustrated lessons prepared by the National Institution for Moral Instruction, through its secretary, Milton Fairchild, and in courses given in progressive schools, especially the Ethical Culture School in New York City. The Ethical Culture School (*q.v.*) owes its origin principally to the efforts of Professor Felix Adler, to whom is to be credited one of the earliest positive attempts to introduce the specifically moral element into American education. This movement led to the formation of a number of Ethical Culture Societies. Among the most influential agencies at present engaged in the movement for moral education in the United States is the Religious Education Association, a voluntary society founded in 1903. This organization held at Providence, R.I., in February, 1911, a convention especially devoted to the subject of moral education, and in its *Journal* for that date it gives one of the most comprehensive summaries of the conditions in the United States in regard to moral education that we possess. It reveals great diversity of opinion, but so far as practice is concerned the prevailing custom is to trust to other agencies than specific courses in morals. State laws or courses of study often emphasize the need of moral instruction, but they do not, as a rule, make such definite provision for it as to insure that the schools should give to it an assigned amount of time and attempt to cover a certain clearly defined field. Here and there where in counties, in cities, or in individual schools

the personal supervision of one superintendent makes possible unity of conception and practice, there have been worked out fairly definite schemes of moral instruction. Legislation has, in general, laid stress upon instruction in the duties of citizenship, on the bad effects of alcohol and narcotics, and occasionally on the humane treatment of animals. (See HUMANÉ EDUCATION.) It has required teachers to be of good moral character, and provided for the punishment of both teachers and pupils for immoral conduct. It is very rare, however, for licenses to be withdrawn for this cause. As for the preparation of teachers for giving moral instruction, the curricula of colleges and of normal schools provide, aside from a course in ethics, very little that has much bearing thereon.

Various Views as to what should be done in regard to Moral Education — When we come to the problem of providing adequate moral culture in the future, we find that the complexity of the factors involved results in a corresponding variety of opinions and suggestions. Five main opinions may be distinguished, although each of these may be subdivided according to particular views on minor points.

(1) A very considerable number hold that moral education requires no addition to the agencies at present at work in the schools. The chief forces in moral culture are, on this view, the personality of the teacher, the discipline of the school, the moral insights and ideals to be derived from the ordinary studies, incidental instruction in moral notions and practices by the teacher and by occasional speakers from outside the school, and intercourse of the children with each other on the playground and in school organizations. Of all these forces the personality of the teacher is usually held to be the most important. If it be of the right sort, it is trusted to inspire the pupils and to be a constant model for imitation that goes on in the main unconsciously. In this agency alone, many believe, lies the solution of the entire problem of moral culture, for, in the last analysis, character can be understood only in terms of the experience that comes from actual contact with it and practice in its ways. Moreover, the discipline of the school, the efficiency of which is so important an element in moral culture, depends upon the personality of the teacher. The sympathy and the justice, the patience and the firmness, the refinement and the strength, the ideals and the common sense of this individual find their expression in the rules of conduct of the school, and especially in the spirit in which they are enforced. Thus through the habituating effects of his steady supervision the momentary inspirations of the child are converted into the traits of a character.

The Herbartians value highly this personal contact, but especially do they emphasize the moral value of the course of study. The im-

portance of each subject is, they hold, in proportion to its reaction on character. This principle determines the selection and arrangement of the curriculum. History and literature show character in action, and thus create ideals and standards, i.e. moral intelligence. Other subjects are made contributory to these, completing the circle of thought and perfecting the sympathy and the judgment. While the Herbartians emphasized the moral value of the content of the studies, the Disciplinarians lay all stress on their form. In the preeminently formal work of the languages and of mathematics they find a discipline of the will to attentiveness, persistence, accuracy, love of truth, etc. When we add to these agencies for moral instruction the life on the playground and in the school societies, we are able, in the opinion of many, to cultivate adequately the additional virtues of courage, tact, self-control, regard for the rights of others, and sense of obligation for public service. Finally, unusual occasions in the life of the school, such as the celebration of an anniversary, the advent of a stranger who will address the pupils, or some crisis demanding an appeal to the spirit of the general body, for example, athletic contests or a reform in bad practices, such as cheating in examinations, — all these afford constant opportunity to promote and to revive healthy moral life.

Those who hold the present agencies to be adequate for moral culture may, and often do, feel a need for greater efficiency in regard to some or all of them. They frequently urge the need of better selection of teachers from the point of view of personal influence, of discipline that will be more effective in developing moral strength, of more careful selection of history and literature with a view to the ethical effect thereof, of such methods of instruction as will more successfully bring out ethical ideas, of more sympathy on the part of the teachers with the play of the child or with his social life and home conditions, of more careful supervision of such of these interests as can be influenced by the school, or of more frequent departures from the routine of the school work in order to introduce an exercise having ethical significance. The study of physiology and hygiene should, many think, include instruction not only in the effects of alcohol and tobacco, but also in matters pertaining to sex. Similarly, the work in history and civics should include more attention than is commonly given to the obligations of the individual in regard to public service. All these reforms involve no radical transformation of the school as at present organized.

(2) A second party consists of those who hold that the key to effective moral instruction is to be found only in religion. They would, therefore, either introduce more religion into the schools or look for the needed betterment of moral education largely to independent

religious agencies, which they would develop to greater efficiency in this field. The various solutions of the problem of the relation of moral and religious instruction have already been dealt with. In general, it may be said that, although the present movement in favor of more moral education has been greatly promoted by those interested primarily in the religious life, still comparatively few look for reform through an increase in the amount of religious instruction in the schools. (See RELIGIOUS EDUCATION.)

(3) A very considerable number hold that what we need is not more or different moral instruction, but rather the development of new and more effective agencies for moral training. Two plans are advocated, each of which has been experimented with. The one strives to develop the idea of student self-government (*q.v.*) so as to awaken in the child as soon as possible the sense of responsibility under the stimulus of sharing in the work of making and administering law. The George Junior Republic (*q.v.*) is, perhaps, as complete an illustration of this conception as we have. Although designed primarily for wayward youth living and working together in a small community, it embodies ideas of self-government that many think should be far more completely realized in every school than they are at present. By such methods it may be possible not only to turn the discipline of the school over largely to the pupils themselves, but even to give them considerable initiative and control in reference to their studies and occupations. The second plan addresses itself to a far more systematic organization of the games and recreations of the young. Children, it is thought, may, and should, be taught to play as well as to work, and through this agency the needed supplement to their present social and ethical training is conceived to be obtainable, for it is in the amusements rather than in the work that ethical degeneration is most to be feared and ethical advance most to be hoped for. Hence playgrounds and recreation centers with competent supervision are advocated for the cities. It is urged that the school should become the leading social center for the community, fostering athletic sports, literary, musical, scientific, and social entertainments, and in numberless ways contributing to the healthy interest of children and even of adults in a common life of voluntary yet incalculably beneficial diversion.

Both self-government and play have from time immemorial been to some extent utilized as educational forces in the great English Public schools, and there their value has been convincingly demonstrated. However, it is felt by many English observers that this Public School life with all its excellent features is too much a life by itself, interested too exclusively in its own affairs to constitute the best sort of a preparation for active participa-

tion in the social life of the outer world. This defect is one likely to be found in boarding school training everywhere, and it is undoubtedly desirable that the school in developing its own community life should keep in close contact with the family, the economic, the social, and the political interests of the wider public (See ATHLETICS, EDUCATIONAL; PUBLIC SCHOOLS.)

(4) Of all the present-day advocates of radical changes in regard to provision for moral education, those who believe in direct and regular instruction in morals make up the most distinct and, perhaps, the most numerous group. They may be divided into two classes. First, we have those who hold that a graded course in morals should run through the school, beginning in the primary department. They insist that such work can be made intelligible, interesting, and practically effective, that it need not be mere preaching, nor be dogmatic, nor productive of priggishness. Second, there are many who regard routine teaching of ordinary preceptive morality as, perhaps, unnecessary and a rather dry formalism at best, but who hold that the older children, especially those of high school grade, should take up the rational discussion of concrete ethical issues such as are creating the difficult problems in the life of the day. School instruction in morality is thus made rational rather than dogmatic and should, therefore, be for the most part postponed until ability to reflect becomes prominent in the child.

(5) Finally, we have many who believe that the failure of our schools in teaching morality is due not to the absence of direct moral instruction, but rather to the divorce between instruction and practice that is found to such an extent in school work. A school that constitutes a genuine life, that teaches through the solution of actual problems that confront the school society will, they think, have no need of special agencies to instruct in duty or responsibility or to train in right habits. The moral sense is born in the practical emergencies of life, and by confronting a child with these we may easily develop that sort of feeling, thinking, and acting which belongs to a strong and efficient character. We need not so much to expand the curriculum in order to include morality, as to reorganize it and the method of teaching it so as to make it stand for an inevitable progress of the child into the problems and the ideals of the social life of the time.

MORAL EDUCATION BOARD.—See MORAL EDUCATION.

MORAL IMBECILITY.—See MORAL INSANITY.

MORAL INSANITY.—This term has been used to indicate an inability on the part of the individual to comport himself in accordance with the legal and moral standards of the community, and is not a disease in itself (although so considered by some English writers). It is a symptom to be found especially in the feeble-minded and in cases of paresis (*q.v.*). The condition is most clearly seen in those individuals who are known as moral imbeciles. These people steal, lie, and perform all kinds of immoral sexual acts to the exclusion of the normal. Such an individual may otherwise be normal mentally, but the moral sense appears to be lacking. The subject is one of considerable importance in dealing with school children, and especially with the so-called delinquent classes.

MORAL TRAINING.—See MORAL EDUCATION.

MORALITY AND MORAL SENSE.—Morality in its objective meaning is the body of practices, habits, and beliefs which the prevailing enlightened judgment of a period regards as right, and which accordingly it strives to inculcate by all forms of education and tuition, and which, within certain limits, it strives to enforce against individuals who openly transgress. The various theories of morals or ethics arise partly from the efforts to criticize, purify, and systematize current morality in the objective sense, and partly in the effort to discover its ultimate basis and justification.

Moral sense, in its broader usage, denotes the body of judgments current in a community with respect to morality. It is called a "sense" to express its relatively unreasoned character; our more fundamental moral estimates and ideas have become ingrained in us by education and habit, and hence are identified with

our immediate emotional and practical responses rather than with consciously reasoned out conclusions. In its more technical meaning, "moral sense" denotes one variety of the theory about morality which holds that moral judgments are innate or intuitive, not the results of experience. The term "sense" is used to indicate the notion that the direct perception of right and wrong attaches to particular cases, not to general principles. In the case of its leading historic representatives, Shaftesbury and Hutcheson, it also connoted an assimilation of our moral to our æsthetic perception. Just as a man of good taste responds immediately to the beauty or ugliness of objects, so a man of moral sense appreciates at once the loveliness or baseness of character and acts. J. D.

See ETHICS; INNATE IDEAS; INTUITION; MORAL EDUCATION.

MORAVIAN CHURCH AND EDUCATION.—The history of the Moravian Church falls into two parts, that of the Ancient Unitas Fratrum, extending from 1457 to the beginning of the eighteenth century, and that of the resuscitated church—variously known as the Unity of the Brethren, Brüdergemeine, Herrnhuters, but most commonly called the Moravian Church—reaching from the latter date to the present time. In both periods this church has been deeply interested and energetically engaged in educational work.

At a very early day the Ancient Unitas Fratrum, first established in Bohemia and Moravia and later in Poland, gave attention to popular education. From its famous precursor, John Huss, great reformer, but also the most popular professor of the University of Prague in his day, it had received inspiration to fight ignorance, the fruitful mother of sin and error. Free elementary schools were opened in all the villages where the Unity had parishes. In course of time they ranked among the best of the land. With the aid of friendly nobles, some fifteen higher schools were established at different points in Bohemia and Moravia, the fame of which attracted pupils from beyond the bounds of the church and the country, even sons of the nobility. In these schools the syllabus was much the same as in other schools of corresponding grade. Latin was taught in most, and in some dialectics, rhetoric, physics, astronomy, and geometry. The system of education was largely practical. Chief stress was laid on religious training. Among the textbooks was a catechism, a book of extracts from the Gospels and Epistles, a "Book of Morals," and the hymnbook of the church, the first edition of which appeared in 1501. A college was founded at Eibenschuetz for young noblemen in 1574. Ten years later a theological seminary was established in connection with this institution, and within the succeeding twenty years other

divinity schools were opened at Jungbunzlau in Bohemia, Prerau in Moravia, and at Ostrorog in Poland. The ministers of the Unity came to be among the most highly educated of the time. The famous college at Lissa, Poland, over which Comenius presided for some time, was begun in 1624. In Comenius (*q.v.*) all that was best in the educational experience of the Ancient Unitas Fratrum was embodied. Practically all of these schools were wiped out by the terrible anti-reformation of the seventeenth century, which well-nigh crushed the church itself, though not before they had given powerful stimulus to the revival of learning all over Europe.

Largely through the influence and almost prophetic provision of Comenius, the traditions of the Ancient Unitas Fratrum and the means for reconstructing its peculiar system were preserved against a possible resuscitation of the organization. In the event, this was brought about at the beginning of the eighteenth century, in Saxony, under the leadership of Count Zinzendorf. Thus the educational ideals of the Ancient Unitas Fratrum were transmitted under the most favorable auspices. They were, also, invigorated by an infusion of the best elements of the European culture of the time through Zinzendorf, of Halle and Wittenberg, as well as Spangenberg and Boehler of Jena, Pyrlæus of Leipzig, and many other university men who became identified with the Moravians and knew the value of liberal culture. Naturally, almost from the beginning of the Moravian settlement at Herrnhut, Saxony, attention was devoted to education, particularly because many of the Moravians were so occupied with the diversified missionary and evangelistic operations of the church, speedily and widely established, that provision had to be made for their children. Hence, boarding schools as well as day schools were started. By 1750 the church had established in Germany an infant school, two boys' schools and a girls' school, a *pædagogium* and a theological seminary; in England a boys' school; in America two girls' schools and a boys' school, besides day schools in each of these countries and elementary mission schools in various heathen lands. In them all the Comenian principles ruled. Great emphasis was laid on religious training; Moravian teachers aimed at well-rounded Christian character. Considerable attention was given to handwork, both for boys and girls. The schools came to enjoy a fine reputation for thorough training and strict moral discipline. Much stress was laid on individual attention. In consequence, the schools became widely popular, especially among the cultivated classes, and at an early day they were opened to other than Moravian children. Thus the church came to recognize in this direction an opportunity for widening its mission. Moravian educational theories were formulated by Bishop

P. E. Layritz in *Betrachtungen über eine verständige und christliche Erziehung der Kinder* (*Thoughts on a rational and Christian education of Children*, 1776), giving suggestions for education up to twenty-one.

Subsequently, the educational activity of the church was greatly developed. In Germany fourteen day schools, primary and more advanced, are maintained. In addition there are ten boarding schools for girls and six for boys. Recently much interest has been shown in industrial schools carried on for girls from fourteen to seventeen years of age, who are instructed in the womanly arts of handiwork, music, housekeeping, etc. There are fourteen such schools. For the furtherance of all this educational activity a teachers' seminary for men was established in 1872, at Niesky, and one for women, in 1875, at Gnadau. The secular instruction is kept well up to the requirements of the Imperial Department of Instruction. Besides, a college and a theological seminary continue their distinctive work, and a missionary training institute is in operation. In England and Ireland there are five day schools. Two boarding schools for boys and five for girls are maintained, which, as regards secular education, are recognized secondary schools, adapted to the requirements of the University Local Examinations. A theological college has been doing its work since 1860, and a missionary training school was established in recent years.

In America Moravians began their work in 1735, settling first in Georgia and a few years later transferring their operations to Pennsylvania and the neighboring colonies. In 1739 Spangenberg wrote to Count Zinzendorf from Pennsylvania (see PENNSYLVANIA, EDUCATION IX) that "almost no one made the youth his concern." Naturally, therefore, Moravians in this country included educational effort in their plans. Their special zeal and capacity for the training of the young blossomed out in schools of various kinds, particularly in Pennsylvania, where the provincial authorities, during the first three quarters of the eighteenth century, did next to nothing for the cause of general education. In 1742 Zinzendorf inaugurated a school for girls in Germantown; later this was transferred to Bethlehem, Penn., where it still continues as a seminary and college for women. A school for boys was founded at Nazareth in 1743, but was transferred, two years later, to Frederickstown, where it flourished for some years. Linden Hall Seminary for girls was founded in 1746, and reorganized in 1794, at Lititz, Penn. During the next three years more than a dozen day schools were opened in Pennsylvania and elsewhere, for it was the policy of Moravian leaders to organize schools wherever they established a congregation or posted a preaching station. Unfortunately, these schools ceased when Braddock's defeat

opened the floodgates and a turbulent stream of savagery poured into the back country beyond the Blue Mountains. Thus Moravian educational effort was driven back upon itself and confined to the parochial and boarding schools of the settlements. Yet at this critical time a boys' school was opened at Nazareth in 1759. After reorganization in 1785, this has continued to the present time. The Salem Female Academy and the Salem Boys' School, N. C., were established somewhat later. Both are flourishing at the present time, the former under the name and character of the Salem Academy and College for Women. At the present time in America Moravians are operating three boarding schools for girls, two of which are also colleges, one boarding school for boys, and three day or parochial schools. In 1807 a theological seminary was established, and reorganized in 1858 under the name and character of the Moravian College and Theological Seminary.

In subjecting to scrutiny the curricula of these schools in their early days, it should be remembered that textbooks were rare. The accessories of the modern schoolroom were mainly wanting. Nevertheless in some of them special attention was paid to English, French, and German. Mathematics, astronomy, and history find their places beside the more elementary branches. At Nazareth Latin and Greek were read. Instrumental and vocal music and drawing contributed pleasant accomplishments. The Bethlehem spinning, needlework, and embroidery were famous, fitting young women for life. In the boys' school at Lititz opportunity was furnished for learning various trades. Unobtrusively and free from sectarian bias, religion was imparted as a matter of course. Despite defects and crudities, here were the elements of a liberal education. At the present time these schools measure up to the standards of similar schools elsewhere in the land.

In colonial days the Moravians maintained mission schools among the Indians. Wherever it was possible in the Indian country, within and beyond the bounds of the Pennsylvania colony, church and school were established. Wickersham, *History of Education in Pennsylvania*, pays these Moravian mission schools the following tribute: "Even Carlisle and Hampton, with all their merit, have less to recommend them as schools for Indians, than had the old Moravian towns of Gnadenhuetten, Friedenshuetten, and Friedensstadt."

The mission work of the Moravians has been extensive, and has embraced the West Indies, Central and South America, Labrador, Greenland, Alaska, the North American Indians, South Africa, East Central Africa, Australia, and Tibet. In each case educational and evangelistic work went hand in hand, various grades of schools being established in many lands.

The present extent of all Moravian educational work may be summed up thus. The Moravian Church operates 409 schools, employs on their account 1312 teachers, and imparts instruction to 36,101 children and young people either bearing the Moravian name or intrusted by those of other names to its educational institutions. Moravian schools embrace a wide range scholastically, from humble elementary schools to technical institutions of recognized worth. There are kindergarten and primary schools, parochial day and boarding schools, industrial, teacher training and missionary training schools, colleges, university affiliations, and theological seminaries. True to their international character, Moravian schools, of one or another of these types, are doing their work on every continent, in many lands, among diverse peoples, and through various tongues. MORAVIAN COLLEGE AND THEOLOGICAL SEMINARY, BETHLEHEM, PA.—

The theological seminary was established in 1807 at Nazareth, Pa., and removed to Bethlehem in 1837, when a regular college course was established. After an interval at Nazareth, the institution was permanently established at Bethlehem in 1858 and incorporated under the present title in 1863. The college offers classical, Latin scientific, and general scientific courses leading to the A.B. and B.S. degrees. The seminary confers the B.D. after a two years' course preceded by classical studies. The enrollment in 1911-1912 was sixty-seven and the faculty numbers six members.

MORBID.—Used particularly in speaking of ideas; is the equivalent of abnormal (*q. v.*). Morbid states may be temporary or persistent, but in either case do not necessarily denote a condition of insanity. S. I. F.

MORBID PSYCHOLOGY.—See PSYCHOLOGY, PATHOLOGICAL.

MORBIDITY IN SCHOOL CHILDREN.—This term is used to indicate the disease rate, usually estimated in percentage for school children. Many extensive investigations in

different countries have now been made. In 1881 Hertel published the results of his classic study of over 4000 school children in the higher schools of Copenhagen. The result showed that 31.1 per cent of the boys and 39.4 per cent of the girls were suffering from chronic diseases, not including defects of sight and hearing. This investigation was followed in 1882 by the appointment of commissions both in Denmark and Sweden to study the subject. The Danish Commission reported on the health of 17,595 boys and 11,646 girls. Of the total number of boys 29 per cent were found ill, of the girls 41 per cent. The report of the Swedish Commission concerned the health of some 18,000 pupils of the higher schools. Axel Key who prepared the report for this Commission gave for the largest group the following statistics. Of 11,210 pupils of the higher boys' schools, 48.8 per cent were afflicted with chronic disease, the largest percentage of illness being found on the classic side. Of 3072 pupils in the higher girls' schools the percentage of illness was 61.7 per cent. These investigations in Scandinavian schools raised grave questions in regard to the conditions of school life in general. How far the school was responsible was not evident, but it seemed clear that the conditions of school life together with home study and an inadequate supply of sleep were in large part responsible.

Since these earlier studies many investigations of the health of school children have been made in Europe and in this country. While the percentage of illness is not as great usually as found by the Danish and Swedish Commissions, it appears that everywhere there are a large number of children suffering from chronic disease. And if we add to this the number that suffer from contagious diseases, and from the various defects of sight, hearing, etc., the number of children that need special hygienic care is likely to be large in any school class.

Many investigations in different cities of this country have shown a large percentage of the school children with chronic disease or physical defects. While it is impossible to generalize from the statistics at hand, it is a conservative estimate that 25 per cent of the children in any school are likely to be handicapped by illness or defect of some kind. On the basis of the investigation of 275,641 children examined in New York City in the years 1905 to 1908, of which 71.9 per cent were found to have diseases or defects, Mr. Wm. H. Allen estimated that the number of school children in the United States needing attention would be over 14,000,000. It is to be understood, however, that these large percentages are due to the inclusion of defects in sight and hearing and diseases of the teeth. While in other parts of the country the percentage of disease may not be as great, it is probably true that if the above-mentioned defects are included, this

estimate would not be too large. Public alarm or ridicule, however, is often based on a misapprehension of the condition just noted.

These children are in every school; their presence cannot be ignored; they make up in large degree the army of laggards; they are apt to be the cases that require discipline, and the cause of most of the absence from school; they make the task of the teacher difficult, and special hygienic care and medical inspection are necessary. W. H. B.

MORE, HANNAH (1745-1833).—English author and philanthropist, born at Stapleton, near Bristol, the daughter of a schoolmaster. She showed a ready ability and keen intellect, and studied Latin, modern languages, history, and mathematics. Although she began writing early, her first serious work was a pastoral drama, *The Search after Happiness* (1762), to be acted by the children at her sisters' school. From this time on she devoted herself with remarkable success to a literary career, and in London made the acquaintance of the leaders in the world of literature, being a favorite with Johnson and Garrick, who produced some of her plays. The death of Garrick (1779) marked a change in her career, and she devoted herself almost entirely to devotional and religious literature. In 1785 she settled in the Cheddar district, at that time notoriously vicious and neglected. Influenced by Wilberforce, Hannah More and her sisters devoted themselves to uplifting and improving the population for ten miles around their home at Cowslip Green. The girls were employed at spinning and weaving; with the boys they were taught the Catechism, Psalms, and the Bible. A Bible class was held for adults. The Mores trained teachers for this work, and Hannah wrote some books. Anxious, however, as Miss More was for the uplift of her neighbors, she considered that reading was a sufficient accomplishment for laborers' children;

but farmers' children might for an extra fee learn writing and arithmetic. Another phase of Miss More's activity was her work against the Jacobin influences of the time and the writings of men like Tom Paine. Of this type was her *Village Politics*, by Will Chip, 1793. In 1794 she commenced the issue of *Cheap Repository Tracts*, consisting of stories for the poor pointing the morals of contentment and loyalty. These appeared three times a month, and were continued until 1797. The circulation in the first year is said to have been over two million copies. In 1818 she published *Moral Sketches of prevailing Opinions of Manners foreign and domestic, with Reflections on Prayer*. In 1799 appeared her *Strictures on the Modern System of Female Education, with a View of the Principles of Conduct prevalent among Women of Rank and Fashion* (1799), in which she criticizes the prevailing demand for external accomplishments and a multitude of knowledge without any depth. Religion, she maintained, should be the most prominent part of education, for "we have to educate not only rational, but accountable beings." At the same time the education of women should tend to make them fit companions and helpmates for men, and "the chief end to be proposed in cultivating the understandings of women is to qualify them for the practical purposes of life." Miss More also wrote *Hints towards forming the Character of a Young Princess* (1805), a book of advice on the education of Princess Charlotte, by some thought to have been written at the request of Queen Charlotte.

MORE, SIR THOMAS (1478-1535). — English statesman and author, born in London, the son of a barrister. He attended St. Anthony's School in Threadneedle Street, where also were Colet and Latimer. On leaving school he was placed in the household of Cardinal Morton, Archbishop of Canterbury, who recognized the boy's ability and had him sent to Oxford (1492). More was entered at Canterbury Hall, which was later incorporated with Christ Church. Here he met Linacre and Grocyn (*q.v.*), and from the former learned Greek. He had broad interests, and besides his ability in Latin and Greek, he had a knowledge of French, history, mathematics, and music. In 1494 his father, fearing for his religious opinions, withdrew him from Oxford and entered him at New Inn, and later at Lincoln's Inn. In 1497 More met Erasmus (*q.v.*), and the two became firm friends; and it is probable that through Erasmus' influence More continued his scholarly pursuits. For a time More had thoughts of retiring into clerical life, but setting them aside he devoted

himself to law with great success. In 1504 he entered Parliament; in 1515 he was sent on a mission to the Low Countries, and there he met many humanist scholars, chief among them Peter Giles, and began what was later published as the second part of the *Utopia*; in 1521 he was knighted, and, enjoying the favor of Wolsey, he was made speaker of the House in 1523; in 1529 he was created Lord Chancellor, retiring into private life in 1532. He joined Henry VIII in his early attack on Luther; but while the King broke away from the Catholic Church, More remained a staunch member; and this, combined with his opposition to the King's marriage to Anne Boleyn, brought him to the scaffold in 1535.

More was a keen man with a strong sense of humor; devoted to the Church, he was not blind to the defects of many of its ministers; with his piety he combined a great love of the liberal studies, to which he added a love of music and art. As an author he composed many poems in Latin and English; in prose his chief works were written in vigorous language, if clumsy in construction, in defense of Papacy against the reformers at home and abroad. His best known work is the *Utopia*, written in Latin and published in 1516 at Louvain, and frequently republished at other places. The earliest English translation was made in 1551 by Raphe Robinson, and has been reprinted by the Oxford University Press. The *Utopia* (*Ὁ ὁράτος*) is a description of an ideal country free from the abuses of the Old World. While More does not pretend to give an exposition of the ideal system of education, there is sufficient indication of his views on the subject. "Of all the pleasures," he says, "they esteem those to be most valuable that lie in the mind, the chief of which arises out of true virtue. . . ." Higher education is only for those who have the ability and inclination; for these education is compulsory, and incompetence is punished by relegation to the class of laborers, the vacancy being filled from below. The studies are carried on in the vernacular, and include music, logic, arithmetic, geometry, and astronomy; while they show a ready ability in learning Greek. Strangely enough, More makes no reference to Latin. For the majority lecture halls are open daily, and they study according to their taste and the demands of their occupations. Moral education of children and youths is cared for by selected priests, who with the adults influence by force of example rather than by compulsion of rules. Importance is attached to physical exercise, which includes agricultural labor and handwork, riding and military exercises, sufficient sleep and moderation in eating and drinking. It must be said, however, that More, unlike other authors of ideal commonwealths, does not lay so much stress on a thoroughgoing system of education as might be expected. In his family life More

paid considerable attention to the education of his children, three daughters and a son, for whom he kept tutors. On the education of women he held that both sexes should be educated alike, for "I do not see why learning . . . may not equally agree with both sexes," for the "true and solid fruits of learning" are primarily the virtues. If women are by nature mentally less able than men, then the aim of instruction must be to remedy the defect. Among the studies which, according to his letters, his children pursued were astronomy, Latin, declamation, composition of verses, exercises in logic, and philosophy. His favorite daughter, Margaret, wrote Latin with such force and purity of style that More's friends could not but believe that it was written by a man.

MORNINGSIDE COLLEGE, SIOUX CITY, IA. — A coeducational institution, maintaining academic, collegiate, music, education, and summer school departments. The entrance requirements are fifteen units. The A.B. degree is conferred on students who complete certain courses which are arranged in five groups. The enrollment in the college proper was 283 in 1911-1912. The faculty consists of thirty-eight members.

MORPHOLOGY. — See **BOTANY**.

MORRICE, THOMAS (fl. 1619). — The writer of a pedagogical booklet, entitled *An Apology for Schoolmasters, Tending to the Advancement of Learning, and to the Virtuous Education of Children*, 1619. Morrice insists on the dignity of schoolmasters' work. Teachers must not make the profession of the liberal sciences servile. The schoolmaster is in the same case with the professors of divinity, law, physic. He must be learned, of ready utterance, and perfect pronunciation of speech. As to the subjects of instruction, first is "pure and perfect English, to be delivered with decent action and gesture, with a right accent and distinct pronunciation"; next "pure and perfect Latin," and "perhaps" Greek. In any case it is the teacher's business to study the child's nature and disposition, and to frame

instructions and precepts thereunto, according to the child's capacity. Sports are to be introduced for recreation, and moderate exercise for health of the body. He particularly emphasizes the visualizing value of traveling for the youth. F. W.

MORRIS BROWN COLLEGE, ATLANTA, GA — A coeducational institution for colored students, founded in 1881 under the African Methodist Episcopal Church, and opened in 1885. Grammar, preparatory, collegiate, normal, musical, theological, commercial and industrial departments are maintained. Degrees are conferred. The enrollment in 1911-1912 was 851 in all departments.

MORRISVILLE COLLEGE, MORRISVILLE, MO. — A coeducational institution chartered in 1872 under the control of the Methodist Episcopal Church, South. Academic, collegiate, music, and expression departments are maintained. The entrance requirements are equivalent to twelve points of high school work. The A.B., Pd.B., and A.M. degrees are granted.

MORSE, JEDEDIAH (1761-1826). — Author of the first American schoolbooks on geography. He studied at the Woodstock Academy, and was graduated at Yale College in 1783. He taught school for a few years, and was one year a tutor at Yale. Engaging in the work of the ministry, he was pastor for thirty years of the First Congregational Church at Charlestown, Mass. He was active in the formation of the Society for the Propagation of the Gospel (1792), and he was the founder of the Association for the Reformation of Morals. But his most abiding labor was in the line of authorship of schoolbooks on geography. His *Geography Made Easy*, published in 1784, was the first American schoolbook on the subject. This was followed in 1789 by his *American Geography, or a View of the Present Situation of the United States*. In 1797 he published his *Elements of Geography*, and in 1814 his *Universal Geography*. For more than thirty years these were almost the sole textbooks on the subject used in American schools; and with the introduction of the study in colleges (Harvard, 1816) they also

found a place in American colleges. In connection with his son, Richard C., Mr. Morse published in 1823 a comprehensive *Universal Gazetteer*. He died at New Haven on June 9, 1826. His son, Sidney Edwards Morse (1794-1871), also attained some distinction as an author of school books on geography. Sidney was graduated from Yale College in 1811, and later studied for the ministry. He published several textbooks on geography, and invented a new system of printing maps in colors. With his brother Richard he established the *New York Observer* in 1823, which he continued to edit until 1858.

See GEOGRAPHY.

MORTALITY, RATE OF, AMONG CHILDREN.—In vital statistics, the rate of mortality, or death rate, is determined by comparison of the number living and the number dying at each age of life for a given area of country. Reliable statistics are obtainable only for certain restricted regions in the United States, owing particularly to the laxity of regulations governing the registration of births. The table reported here was prepared by the Secretary of the State Board of Health of Massachusetts for the years 1893-1897, and may be considered reliable for the region concerned and fairly typical of the conditions prevailing over the greater portion of this country.

DEATH RATE, PER 100, FOR BOYS AND GIRLS IN MASSACHUSETTS

YEAR	1	2	3	4	5	6	7	8	9	10
Boys	17 23	4 22	2 00	1 40	1 08	0 81	0 65	0 54	0 45	0 39
Girls	14 70	4 00	1 92	1 40	1 00	0 83	0 66	0 55	0 46	0 49

YEAR	11	12	13	14	15	16	17	18	19	20
Boys	0 33	0 29	0 28	0 30	0 36	0 43	0 49	0 53	0 58	0 62
Girls	0 35	0 31	0 31	0 34	0 40	0 47	0 54	0 58	0 61	0 65

Inspection of this table suggests the following inferences: (1) For both sexes the first year of life has by far the highest mortality. (2) Male children under three have uniformly a higher death rate than female children of the same age. (3) During the years five to twenty-one, inclusive, the female death rate is slightly higher than the male. (4) The year of minimal mortality is the twelfth for girls and the thirteenth for boys, or the year just at the dawn of puberty in each sex. (5) There is no evidence that attendance at school affects the death rate either favorably or unfavorably.

E. M. Hartwell's report, in 1894, on the mortality of children in the city of Boston alone,

which was based on data for the census years 1875, 1885, and 1890 shows, for each age, a higher death rate than that given above for Massachusetts as a whole. Hartwell found the year of minimal mortality in Boston to be the thirteenth for boys (0.34 per cent) and the twelfth for girls (0.32 per cent). Both distributions, however, concur in showing that "the period 10-15 is the half-decade in all human life in which fewest deaths occur to a thousand living," and that the minimal year is earlier for girls than for boys. It will be noted that the maximal resistance to fatal disease coincides with the maximal rate of growth in height and weight. G. M. W.

MOSCOW, UNIVERSITY OF.—See RUSSIA, EDUCATION IN.

MOSELLANUS, PETER (1493-1524).—Humanist scholar, so called from the position of his native town, Bruttig, or Proteg, on the River Moselle. He became a student in the University of Cologne in 1509, and studied under the humanist Hermann von dem Busche, was fellow pupil with Erasmus at Deventer, and learned Greek from Johannes Casarius. He then studied at Freiburg and in 1515 went to Leipzig, and in 1517 he succeeded Richard Croke, the successor of Erasmus, as Reader of Greek at Cambridge. Mosellanus gave a notable inaugural address of *variarum linguarum cognitione*. Greek was still a "suspect" subject, and this, with his advocacy of the introduction of Hebrew gave color, at that time, to a twofold charge of "heresy" from ecclesiastics. Of frail body, enfeebled by sickness and privation, he bore himself bravely, a martyr to the humanities, and in a celebrated address given in 1528 won the audience of students as against his critics. In the year of his appointment, 1517, he was able to publish his collection of Latin Colloquies, which he called *Pedologia*, as to which he received a letter of congratulation from the great Erasmus. Forty-five editions of this work appeared by 1550, one of these in England, 1532, by Wynkyn de Worde. These dialogues graphically disclose the state of life in Leipzig University, as the *Manuale Scholarium* of 1480 had described the Heidelberg students. (See STUDENT LIFE.) Lily's *Latin Grammar* borrowed the plan of the verbal figures from Mosellanus, though with alterations. Malim's *Consuetudines* (1561) for Eton include the study of the Mosellan figures by Forms VI and VII.

Mosellanus died in 1524, at the age of thirty-one years. In 1528 in the *Ciceronianus* he received the high praise of Erasmus: "There is

nothing great which might not have been expected from him, had not a premature death snatched him from our midst in youth, scarcely entered into the arena of glory, to the great grief of all the learned and the no small loss of learning." F. W.

MOTIVE.—That phase of a volitional process which precedes in consciousness the decision or choice. Thus the motive for going to have a tooth pulled may be the pain which it causes. The motive for not having it pulled may be the thought of disfigurement. The motive has sometimes been treated as essentially an intellectual or cognitive process. Wundt recognizes, on the other hand, two aspects in every motive, an affective or feeling component, which he calls the impelling feeling, and the ideational element, which he calls the moving reason. Thus he says, "When a beast of prey seizes his victim, the moving reason is the sight of the victim, the impelling feeling may be either the unpleasant feeling of hunger or the race-hate aroused by the sight." (*Outlines of Psychology*, § 14, 4.) It may be pointed out that even when there is an impelling feeling included in a motive, the feeling must be consciously recognized as a part of the situation before it can serve to determine the volition. It need not, however, be reduced to a cognitive process through this conscious recognition.

The educator is interested in the question of motivation of action from two points of view. First, in practical procedure the teacher must ask how can adequate motives be found to stir up activity of the right sort? Secondly, the teacher is concerned with the subsequent effects of the employment of motives. Thus the hope of reward or the fear of punishment may be practically effective, but may so sap the independence of the pupil as to render him incapable of intelligent self-guidance in later life. The problem of motives is especially important in school life, since the school environment is in a high degree artificial, and genuine motives are difficult to provide.

In connection with the training of the will, it is to be pointed out that the cultivation of clear, broad insight is the surest guarantee of correct behavior. In terms of the analysis of motive suggested in the above paragraph, this means the cultivation of clear intellectual insight into the needs of individual and social life as ground for action. C. H. J.

MOTOR ABILITY.—See MOTOR EDUCATION; MOTOR INSTINCTS, etc.

MOTOR CONTROL.—See HABITS.

MOTOR DEFECTS.—See MOVEMENT DISORDERS.

MOTOR EDUCATION.—See ACTIVITY; also MOTOR PROCESSES

MOTOR INSTINCTS.—See INSTINCTS.

MOTOR PROCESSES.—The nervous system may be roughly divided into sensory and motor regions. The sensory regions are those which receive stimulations from the external world, and the motor regions are those which send out impulses to the muscles of the body. The relation of sensory processes to consciousness has always been fully recognized. Color and sound and the other sensations are all readily recognized as sources of conscious experience. The discussion of sensation has therefore always been an important chapter in any treatment of the relation between mind and body. On the other hand, the relation between the motor processes in the nervous system and conscious experience is much more complicated and obscure. Certain motor processes, such as those of reaching out the hand to grasp a desired object, are obviously related to the conscious processes of choice and volition. But it very early became apparent to students of human behavior that many of the contractions of the muscles are in no wise to be treated as voluntary processes. The contractions involved in respiration, in many of the instinctive activities, and in most of the emotional expressions are not matters of voluntary choice. There is, nevertheless, a traceable connection between all of these muscular activities and the general state of consciousness, even where volition is not involved. This is conspicuously true of the emotional reactions. These reactions have their conscious parallels in very pronounced states of feeling. Not only is feeling related to the muscular activities, but it has become obvious during the more complete analysis

of the perceptual processes that here also the muscular activities are of importance: thus in describing the methods which we follow in visual perception, some place must be given to the movements. Berkeley, Helmholtz, Wundt, and others have laid great emphasis upon eye movements as factors in the development of visual space perception. Here again consciousness is not of the volitional type, but rather of the perceptual type. Any defect in the movements of the eye will reflect itself in the change in the form of visual knowledge.

So fully has the importance of motor processes come to be recognized in recent psychological discussions, that a number of theories have been propounded to explain their place in the general economy of mental life. In a paper in the *Psychological Review* of 1896 Dewey criticizes that doctrine of the conditions of mental life which distinguished sharply between the motor processes and the sensory processes. He holds that both of these processes are involved as necessary conditions of every state of consciousness, and that both contribute equally to the completed conscious activity. This may be made clear by quoting briefly one of his illustrations: "Take the withdrawal of the hand from the candle flame for example. What we have is a certain visual-heat-pain-muscular-qualé, transformed to another visual-touch-muscular-qualé." That is, the reaction is just as essential to the complete recognition of the object as is the visual experience.

The tendency to emphasize motor processes as equally significant with sensory processes appears also in the writings of MacDougall in a series of articles in *Mind* for 1898. MacDougall points out that consciousness is present only where muscular and nervous processes are being organized into new forms of behavior. That is, consciousness would disappear entirely, if the nervous system were not involved in working out certain new connections.

A third theory is that set forth by Münsterberg in his "action theory." Münsterberg holds that the motor processes in the nervous system condition the vividness and value of all experiences. The more open the motor channels, the greater the vividness of the experience; thus when one is ready to act instantly upon the reception of a stimulus, the experience will be much more vivid than when he is unprepared for action. The term "value" as used by Münsterberg differs very little from the general term "emotional tone." If the stimulus is discharged into certain sets of muscles, the emotional tone is pleasurable; if discharged in other directions, it takes on a different character.

An older doctrine with regard to the motor processes was that defended in his earlier writings by Wundt, and known under the

name of "innervation theory." According to this theory, the outgoing motor processes, as they leave the cerebrum, are conditions for certain phases of experience which are co-ordinate in importance with the conscious elements aroused by incoming sensory processes.

To the untechnical student of mental development the emphasis which psychologists lay upon the motor processes seems somewhat extravagant. One reads with great reserve the statement that a very large part of mental life is drawn from muscle sensations or joint sensations. The technical student of mental processes, on the other hand, finds himself constantly driven to the recognition of the fact that sensory qualities are bound together in space percepts through movement, and that the whole end of conscious activity is to be sought in some form of behavior. Many students of psychology are prepared to use the word "behavior" as the most important general word in their psychological vocabularies. The sensory stimulus is significant merely because it sets going some organized train of behavior. The psychology of habit, in addition to the other topics above mentioned, immediately suggests itself as an important part of this general discussion.

To the teacher the recent discussion of motor processes is significant because it draws attention to the fact that activity of some type is essential to all educational development. There is no such thing, as William James points out in his *Talks to Teachers*, as "sensation without behavior" (page 26). "No truth however abstract is ever perceived that will not probably at some time influence our earthly action. You must remember that when I talk of action here I mean action in the widest sense. I mean speech, I mean writing, I mean yesses and noes, tendencies 'from' things, and tendencies 'toward' things; and I mean them in the future as well as in the immediate present." James further summarizes his psychological view of education by defining education as training in behavior.

All of the recent movements toward the introduction of constructive work into the school emphasize the practical importance of muscular activity for education. So enthusiastic have some defenders of activity been in their advocacy of this type of school work that they have criticized the older forms of education as entirely devoid of motor processes. Students of education should recognize the falsity of the criticism in view of the fact that speech is a form of motor process as well as is manual work. Furthermore, some of the recent advocates of constructive work have stated that unless children are given something to do in the schools their motor organism is likely to atrophy. We are told that the motor areas of the cerebrum will suffer if not properly exercised by school practice. Here again attention should be turned to the fact that

MOUNT ALLISON COLLEGE

some kind of motor process will always follow upon the stimulation of the nervous system. There will be inner organic movements if no other. The major need of the school is not activity on the ground that it was entirely absent in the earlier forms of education, but rather the selection of those forms of motor activity which are most likely to develop the individual. If manual training is a more satisfactory form of activity in order to produce certain types of perceptual recognition, it should be introduced, not because it is a form of motor process merely, but because it is a better form of motor process than verbal reaction for the purpose in hand. There may be certain cases in which verbal reaction is very much more economical and advantageous. In this case the verbal reaction will draw the attention of the learner to certain distinctions that could not be clearly marked in any constructive activity.

All forms of behavior, therefore, should be considered in any complete psychological discussion of education. Indeed, it is probable that the motor processes will receive increasing attention in future psychological analysis of children's consciousness and development. That expression as well as impression is important to the teacher is demonstrated beyond the possibility of any doubt, and the study in detail of the different forms of expression remains as one of the major lines for future educational investigation. MOUNT ALLISON COLLEGE UNIVERSITY, SACKVILLE, N.B.—Established in 1858 as Mount Allison Wesleyan College, the present title being adopted in 1886. The institution is owned by the General Conference of the Methodist Church of Canada. The following courses are given: arts leading to A.B.; divinity leading to B.D.; engineering leading to entrance on the third year of Applied Science at McGill University; and honor courses in classics, mathematics, science, philosophy, and English language and literature. The institution is coeducational, and is affiliated with McGill University. The faculty consists of eighteen members, and the student body 250 in 1912.

MOUNT ANGEL COLLEGE AND SEMINARY, MOUNT ANGEL, ORE.—An institution founded in 1887 and conducted by

MOUNT ST. MARY'S COLLEGE

the Benedictine Fathers. Preparatory, commercial, academic, and collegiate departments are maintained. Degrees are conferred in arts, letters, science, and music. The enrollment in 1911-1912 was 175.

MOUNT HOLYOKE COLLEGE, SOUTH HADLEY, MASS.—An institution for the higher education of women chartered in 1836 and opened in 1837 as Mount Holyoke Seminary through the efforts of Mary Lyon (q.v.), who was president from 1837 to 1849. In 1888 the institution was chartered as Mount Holyoke Seminary and College, and in 1893 obtained the present title. The entrance requirements are fifteen units; students are admitted by certificate or examination. The A.B. degree is conferred on completion of a course of two years of prescribed and two of elective work. The enrollment in 1911-1912 was 771. The staff consists of 115 members.

MOUNT SAINT AGNES COLLEGE, MOUNT WASHINGTON, MD.—A Catholic educational institution founded in 1867 and chartered as a college in 1890. A high school and schools of art and music are maintained in addition to the college department. Requirements for admission are the completion of a classical high school course. The A.B. degree is conferred by the institution.

MOUNT SAINT JOSEPH'S COLLEGE, BALTIMORE, MD.—An institution incorporated in 1876 and conducted by the Xavierian Brothers. Commercial, classical, scientific, and normal courses are given. Students are admitted to the college department on completion of a high school course. The college confers the A.B., B.S., and A.M. on completion of the appropriate courses. The enrollment in 1910-1911 was 169.

MOUNT ST. JOSEPH COLLEGE, DUBUQUE, IA.—An institution for the higher education of women, founded and maintained by the Sisters of Charity of the Blessed Virgin Mary. College, academic, commercial, preparatory, music and art departments are maintained. The entrance requirements are twelve units. The A.B. and B.S. degrees are conferred. The enrollment in 1908-1909 was 221.

MOUNT ST. MARY'S COLLEGE, EMMITSBURG, MD.—A Catholic college with a secondary school department founded in

1808 and conducted by secular clergy. A four years' course leads to the A.B. degree, and the A.M. is also conferred. An ecclesiastical seminary is also attached to the college. The enrollment in 1910-1911 was 357. The teaching staff consists of eighteen members.

MOUNT UNION COLLEGE, ALLIANCE, OHIO.—A coeducational institution established in 1846 as Mount Union Seminary, and chartered as a college in 1857. An academy, college, and conservatory of music are maintained. The entrance requirements are fifteen units. Classical and scientific courses are offered leading to the A.B. and B.S. degrees. There was in 1911-1912 an enrollment of 183 students in the college proper.

MOUNT VERNON COLLEGE, MOUNT VERNON, OHIO.—A coeducational institution maintained since 1905 by the Seventh Day Adventists with college, normal, industrial, commercial, academic, music, and nursing departments. Four years of high school work are required for entrance; courses are given leading to the A.B. and B.S. degrees. The enrollment in 1911-1912 was 162. The teaching staff consists of nineteen members.

MOVEMENT DISORDERS.—These are very varied and limit the ability of the individual to properly react through stimuli. They may be grouped as: (a) slowings (see *RETARDATION*); (b) lessened power (e.g. paresis (*q.v.*), paralysis (*q.v.*), monoplegia, hemiplegia, paraplegia, diplegia, rigidities, and contractures); and (c) increased motility (e.g. tremor (*q.v.*), spasm (*q.v.*), tic (*q.v.*), and convulsion (*q.v.*)); see also *APHASIA*; *ATAXIA*; *CHOREA*; *EPILEPSY*; *INTOXICATION*; *KATATONIA*; *PAROXYSM*; *SPEECH DEFECTS*; *STAMMERING*; *STUPOR*; *VERTIGO*. S. I. F.

MOVING PICTURES AS MEANS OF INSTRUCTION.—See *VISUAL AIDS TO TEACHING*.

MOVING SCHOOL.—The moving school was the first and the most distinctive step in the evolution of the district school (*q.v.*). The original town school of New England had been located in the village during the entire year and was taught (except in the largest towns) by a single teacher. The moving school was this school of one teacher located in various parts of the town during successive periods of the school year. It was most prevalent during the first half of the eighteenth century. The more remote conditions leading to its creation were: (1) social disintegration, (2) dispersion of population, (3) decentralization of local institutions due to growth of democracy, (4) example furnished by the scattered private master and dame schools, (5) renewed interest in education, which

brought about the passage of laws imposing heavier fines upon towns for failure to maintain schools (in 1701 and 1718) and which secured, also, a rigid enforcement of such laws. The immediate reason for its establishment was the abolition of the tuition tax and the raising of the entire support of the school by the town rate. Many of the inhabitants throughout the town kept their children at home rather than pay the town tax; experience proved the impossibility of raising the master's salary by the combined town rate and tuition tax. On the other hand it cost little or no more to maintain a school by town rate than to pay a fine by town rate. At this juncture the people in the outer sections would not vote the town rate for a school unless they enjoyed its benefits equally with the inhabitants of the village. Thus the village was compelled to yield and the moving of the town school into the various outer sections resulted.

The next step in the evolution of the school district was the divided school (*q.v.*). H. U.

MUHLBERG COLLEGE, ALLENTOWN, PA.—Formerly Allentown Academy, incorporated under the present title in 1867 and now under the control of the Evangelical Lutheran Ministerium. Academic and collegiate departments are maintained. The entrance requirements are fourteen units. The A.B., B.S., and Ph.B. are conferred on completing the appropriate courses. The total enrollment in 1910-1911 was 278. The teaching staff consists of thirteen members.

MULCASTER, RICHARD (c. 1532-1611).—English schoolmaster and educational writer, born at Brakenhill Castle of a border family. He was educated at Eton under Nicholas Udall (*q.v.*) and in 1548 was at Cambridge as a King's scholar. In 1555, however, he is found at Christ Church, Oxford, where he graduated in 1556. He was appointed the first headmaster of Merchant Taylors' School (*q.v.*) and taught there successfully for twenty-five years. In addition to Latin, Greek, and Hebrew he devoted attention to vocal and instrumental music and drama. In 1573-1574 and 1575-1576 he presented plays before Elizabeth, who later appointed him rector of Stanford Rivers in Essex. Owing to a dispute with the governors of the school, he resigned in 1586, but again appeared at the school in 1588 as an examiner. (See *EXAMINATIONS*.) For several years he seems to have attended to his clerical duties, but in 1596 he was appointed headmaster of St. Paul's School, where he remained until 1608. He died in

straitened circumstances in 1611. Whatever Mulcaster's claim to reputation as a teacher may have been, he will always have a place in the history of English education as the author of two works full of ideas and suggestions which were some three centuries in advance of his time. Unfortunately his style of writing was not one to command attention and although his works possess a richer educational content than those of his contemporaries, Ascham and Elyot, they remained neglected until they were restored by the revival of educational interest in the last century. In 1581 appeared *Positions wherein those Primitive Circumstances be examined, which are necessarie for the Training up of Children, either for skill in their Books or Health in their Bodie*. The work is dedicated to Queen Elizabeth. The *Positions* are the fundamental principles for an efficient system of education. The author gives his reasons for writing the treatise in English: those who know Latin will find just as much ease in understanding English, and generally that language is better understood which is used from childhood, "as our first impression is alwaie in English before we do deliver it in Latin. And in perswading a known good by an unknown waie are we not to call unto us all the helpees that we can, to be thoroughly understood?" Mulcaster begins with the earliest education of the child, whose individuality must be respected by teacher and parents. All classes of society are to attend the elementary school where reading, writing, drawing, and music are taught; the vernacular is always to precede a foreign language. Mulcaster is probably the earliest advocate of drawing "by penne or pencil, . . . verie requisite to make a man able to judge what that is which he byeth of artificers and craftsmen, for substance, forme and fashion, durable and handsome or no; and such other necessarie services, besides the delitefull and pleasant." In the teaching of music (singing) he emphasizes the value of proper breathing. A great part of the work is devoted to the value and character of physical training, for Mulcaster insists on the *mens sana in corpore sano*. This part of the treatise is based very probably on the *De Arte gymnastica* of Girolamo Mercuriale (1530-1606). Mulcaster not only gives a large number of exercises and games to train all parts of the body, but he suggests the proper seasons of the year and the time of day for the various exercises. In dealing with school buildings he emphasizes the importance of air, light, and playgrounds. The elementary school should be compulsory for all, rich and poor, boys and girls. Not all can be scholars or learned in the classics, but all should have the elements, and in higher education greater differentiation of courses is desirable. On the education of girls and women he takes up a very progressive position; he argues as follows: "Our countrey doth allow it, our dutie doth enforce it, their

aptnesse calls for it, their excellencie commandes it: and dare private conceit once seem to withstand, where so great and so rare circumstances do so earnestly commend." But handwork for girls is not to be neglected. On the question of private tutorial education as opposed to public he ranges himself strongly on the side of the latter and overthrows all the traditional arguments in favor of private tuition. So, too, he is at one with Ascham in opposing the prevailing system of foreign travel. But it is on the question of teachers that Mulcaster becomes almost prophetic. Setting up high standards for the teacher (professional spirit, all-round knowledge, and discretion), he insists as strongly on their proper training. He recommends the establishment of training colleges at the universities parallel to other professional schools for divines, physicians, and lawyers, — an ideal only just beginning to be realized.

In 1582 appeared *The First Part of the Elementarie* which deals with the correct use of written and spoken English. This is one of the earliest as well as one of the strongest pleas for the cultivation of the vernacular. Mulcaster is opposed to the bondage to Latin. "I love Rome," he says, "but London better; I favor Italy, but England more; I know the Latin, but worship the English." He discusses the origin of language, orthography, and language reforms, and gives rules for orthography and composition. A *Second Part* was apparently contemplated, but never appeared. Mulcaster also wrote verses in Latin and English, indifferently in both, and was the author of a *Cato Christianus*. Much was done by Quick (*q.v.*) in drawing attention to the original and suggestive works of the practical schoolmaster who ruled over the two greatest London schools of his day.

MULLANY, PATRICK JOHN (BROTHER AZARIAS) (1847-1893).—Educator of the order of Christian Brothers. He was educated in the colleges of his order in America and subsequently studied in England and France. He was president of Rock Hill College (1879-1886) and professor in De La Salle Institute

in New York (1889-1893). He was one of the founders of the Catholic Summer School at Plattsburgh, N.Y., and wrote numerous papers on education and philosophy, as well as books on the philosophy of history, literature, and the relation of Aristotle to the Christian church.

W. S. M.

MULTIPLICATION.—In its primitive form, the operation of taking one number as many times as there are units in another, or of folding a number on itself many times, from *multus* (many) and *plicare* (to fold). The word is related to the English *manifold*, and it appears in various languages with a similar kind of translation. Thus it is found in the early printed books of Germany in the form of *mannigfaltigen* and *vervielfachen*, as well as *Mehrung*.

The idea of "leading" a number into this manifoldness is seen in such Latin expressions as this from Jordanus (1496 edition of his arithmetic): "Si aliquis numerus . . . ducatur." Clichtoveus (1503 edition) says: "Multiplicare, est ex ductu vnus numeri in alterum producere," and similar expressions are found in most Latin works. This is the origin of our common expression in algebra, "a into b."

The definition of multiplication has always given trouble on account of the continual broadening of the idea. As soon as a fractional multiplier appears the primitive definition ceases to be valid. For example, we do not look out of a window half of a time, and hence the expression " $2\frac{1}{2}$ times 4" is meaningless unless we extend the significance of multiplication and of the word "times." This has been done, and no one objects to saying " $2\frac{1}{2}$ times 4" at present, although many would still object to saying " $\frac{5}{2}$ times 4," which would be quite as justifiable if it were not that we have as short expression, and one that is more exact, in " $\frac{5}{2}$ of 4." There is no definition of multiplication that covers the cases needed in elementary and secondary classes, and that is at the same time simple enough for children. It is doubtful if there is any advantage in learning a definition like the familiar one that "multiplication is the process of taking one number as many times as there are units in another." The important thing is that the term should be correctly used, but that a definition covering the case of $-\frac{1}{2}\sqrt{3} \times (-\frac{2}{3}\sqrt{-1})$ should be learned by beginners is not at all necessary. One of the best of the elementary definitions is the one that states that multiplication is the process of finding a number that is derived from the multiplicand in the same way that the multiplier is derived from unity; but this is open to the objections of difficulty as well as uncertainty. It is, however, one of the oldest of our definitions, appearing in the works of Maximus Planudes in the fourteenth century and in many of the first printed textbooks.

Of the terms employed, "multiplicand" comes from *numerus multiplicandus*, "Anglico ye nombur the quych to be multiplied" (as our earliest English manuscript on the subject translates it). It appears in this full form in most Latin arithmetics, but finally *numerus* was dropped, as in the writings of Licht (1500), Huswirt (1501), and Cirvello (1505), leaving only *multiplicandus*. The word "multiplier" has had a varied career, appearing as *multiplicans*, *multiplicator*, *multiplicante*, and *multiplicant*, besides having various other forms. The word "product" is relatively modern as limited to multiplication. It has as often been applied to the result of addition, meaning simply the outcome of any operation. Instead of product, *factus* has been used by good writers, and there is some reason for this usage in view of the word "factor." This brief historical sketch is introduced to suggest a doubt as to the necessity for the difficult technical terms now taught to children. The early writers spoke of the number to be multiplied, which in Latin is *numerus multiplicandus*, and there is no reason why we should not say "number to be multiplied" to-day, at least to primary children. Neither is there any reason why we should not use "answer" or "result" for all of the operations. In time it is probable that some such simple terms will be evolved.

As to the operation itself, the history is very long. Bhaskara (*q.v.*) gives five plans, and

Pacioli (*q.v.*) gives eight. One of these was known as the "grating," or "quadrilateral" plan, and is here shown from an Italian manuscript of about 1420. It was also known as the "gelosia" plan, because the Venetians called the gratings in front of their windows by this name,—whence the modern French *jalousie* for a kind of a

MULTIPLICATION

blind. Out of all the plans that have been suggested, only one remains in common use. This was invented by the Florentine business computers, and went by the name of the *bericocolo* method, because it represented the numbers arranged in little squares such as were found on a kind of cake (*bericocolo*) and used in Tuscany. The Venetians more commonly called it by the name *scachieri* (*scacherio*, and other variants) because the little squares resembled those on a chessboard. It was long after the time of the first printed books that the older methods were completely abandoned for this one. The object of this historical sketch is to suggest that it is quite probable that we have not yet settled upon the best method. The introduction of decimal fractions (see FRACTIONS) has made it often necessary to multiply to only a limited number of decimal places, and the ordinary method carries the work farther than necessary. It seems possible that we may soon be teaching in the schools some contracted process that will carry the result only as far as needed.

The multiplication table has had three general forms. Of these the column arrangement is the oldest, being found in the clay tablets of ancient Babylon, of the third millennium B.C. The column table was often very extensive, running up to factors in the hundreds. The products were not memorized, but the tables were used for reference, and when a product was found in this way, the multiplication was said to have been performed "per colonna" (by the column). The following are parts of such a table taken from a Florentine manuscript of about 1450.

1	2	3	4	5	6	7	8	9	10
1	1	2	3	4	5	6	7	8	9
2	2	4	6	8	10	12	14	16	18
3	3	6	9	12	15	18	21	24	27
4	4	8	12	16	20	24	28	32	36
5	5	10	15	20	25	30	35	40	45
6	6	12	18	24	30	36	42	48	54
7	7	14	21	28	35	42	49	56	63
8	8	16	24	32	40	48	56	64	72
9	9	18	27	36	45	54	63	72	81
10	10	20	30	40	50	60	70	80	90

1	2	3	4	5	6	7	8	9	10
1	1	2	3	4	5	6	7	8	9
2	2	4	6	8	10	12	14	16	18
3	3	6	9	12	15	18	21	24	27
4	4	8	12	16	20	24	28	32	36
5	5	10	15	20	25	30	35	40	45
6	6	12	18	24	30	36	42	48	54
7	7	14	21	28	35	42	49	56	63
8	8	16	24	32	40	48	56	64	72
9	9	18	27	36	45	54	63	72	81
10	10	20	30	40	50	60	70	80	90

A second form was used by the more scientific writers. It was the square array, and was commonly called in Medieval and Renais-

MULTIPLICATION

sance times the Pythagorean table (*Mensa Pythagorica*, *Tavola Pitagorica*, *Table de Pythagore*). It first appears in print in an edition of Boethius, although Boethius probably never knew such a table, this being an interpolation of some later copyist. The following illustration shows the table as it appeared in the first edition.

Tetragona.				Longitudo.						Scabellum.			
Scabellum.	Longitudo.	Tetragona.	Scabellum.	1	2	3	4	5	6	7	8	9	10
				2	4	6	8	10	12	14	16	18	20
				3	6	9	12	15	18	21	24	27	30
				4	8	12	16	20	24	28	32	36	40
				5	10	15	20	25	30	35	40	45	50
				6	12	18	24	30	36	42	48	54	60
				7	14	21	28	35	42	49	56	63	70

				10	20	30	40	50	60	70	80	90	100
Scabellum.				Longitudo.						Tetragona.			

The third standard form of the multiplication table is the triangular array, formed by cutting the square along the crossed diagonal in the preceding illustration. This was used by many early writers of mercantile arithmetics.

The question of learning the multiplication table as such has agitated some teachers in every generation. It is one of the most patent facts in education that children and adults are deficient in the combinations of numbers in addition and multiplication, and that, with all the time at the disposal of the schools these number facts should be more thoroughly known than at present. The tendency of a generation ago to let the child acquire these number facts as the need appeared, memorizing them as acquired, has happily been checked. Unless the table is learned thoroughly, as such, not all of the combinations will receive the requisite attention. It should be the subject of constant oral drill,

and if possible it should be placed where it can also be seen. Besides the tabular drill there must be an equal amount of drill upon

MUMPS

the isolated combinations, 4×7 , 9×6 , and so on. This learning of the table does not exclude the introduction of motive, nor does it in any way interfere with modern ideas as to how number facts should first be presented.

The explanation of the process offers few difficulties. In general, it is well to give the full form of any operation first, followed at once, and before the pupil acquires his habits of work, by the form to be used in practice. The explanations of the ordinary textbooks are generally quite sufficient for the purpose in view. D. E. S.

See CHECKS ON COMPUTATIONS.

MUMPS. — Mumps, more technically parotitis, or parotiditis, is an acute, highly infectious, febrile disease, characterized by swelling of the parotid gland. It breaks out in brief, but intense, epidemics, usually during cold and wet seasons. Though few not rendered immune by previous attacks escape infection, these epidemics bring little or no mortality. It is rare in infancy and after middle age and commoner in males than in females.

The cause of mumps is obscure, though probably a microbe present in the saliva and disseminated by the breath. The period of incubation is long, from two to three weeks, often nineteen days, and the disease runs its course in about a fortnight more.

As a rule, premonitory symptoms are absent or very mild. The onset is sudden, with pain and stiffness at the back of the lower jaw, followed in a few days by the characteristic swelling of the region just under the lobe of the ear, and extending forward and downward to a degree depending on the severity of the case. A moderate fever lasts for four or five days. The swelling reaches its height in from two to five days, is stationary for two days, then rapidly subsides. The inflamed region is painful and very tender. In some cases the skin may redden and even peel. Speech is difficult and muffled. Swallowing or mastication is painful and the diet must be exclusively fluid. The head is bent forward or toward the swollen side. There may be headache, earache, vomiting, and other symptoms of general ill health. In mild cases there may be but little pain or swelling, but these cases are as infectious as the severe ones.

The most common complications are swelling and pain in the testes, mammae, and ovaries, which may follow subsidence of the parotid inflammation, particularly in adolescents and adults. In rare cases the inflammation is transferred to the brain and death may result from meningitis. In any event, the patient, even in mild cases, should remain in bed until convalescence ensues. The disease is self-limited and the treatment consists primarily in insuring free action of the bowels and protection of the swelling from cold.

The period of infection extends from the

MUNICH

appearance of the swelling for some three weeks, or about two weeks after the fever subsides, though some authorities believe that infection is spread in school during the period of incubation. Children suffering from mumps should be excluded from school for at least four weeks after the swelling appears. Opinion differs as to whether other children living in the same house should also be excluded. In any event, it is rarely necessary to close the school as a precautionary measure.

MUNICH. — See GERMANY, EDUCATION IN; INDUSTRIAL EDUCATION.

MUNICH, ROYAL BAVARIAN LUDWIG-MAXIMILIAN UNIVERSITY OF, GERMANY. — The history of the present university at Munich dates back to the foundation of a university at Ingolstadt by Papal Bull obtained by Duke Louis the Rich in 1459. The opening, however, was delayed and took place in 1472, with faculties of theology, law, medicine, and arts. The university was modeled on the University of Vienna. Ingolstadt played a prominent part in the Renaissance period and numbered among its teachers Celtes, Reuchlin, and Aventinus. During the Reformation it became the rallying point of Catholicism, Dr. Eck, Luther's opponent, being then a member. From the sixteenth (1556) to the eighteenth century the university was under Jesuit control in all its faculties. In 1772 the Jesuits were removed from the university, and the theological faculty was placed under the Benedictines. Under directorship of J. A. Ickstatt in the middle of the eighteenth century much progress was made. In 1799 a *Kameral-Institut* was established, which developed into a faculty of political science and economics, and for a time included also technology, agriculture, and forestry. In 1800 the university was moved to Landsbut, and received the present title in 1802. The transference to Munich took place in 1826, much to the advantage of the university, which was now practically amalgamated with the Academy of Science. The royal family were strong supporters of the institution. New buildings were provided in 1840, and a hostel (Maximilianeum) was established by Maximilian II. In 1868 a *Technische Hochschule* was established in Munich, and agriculture and to some extent forestry were provided for in separate institutions. Courses have been increased; the collections have been augmented, and institutes and seminars have been added. The following faculties are maintained: theology (Catholic); law; political science; medicine; and philosophy (section for philosophy, philology, and history, and section for mathe-

matics and science). The enrollment in the winter semester of 1910-1911 was 6905 matriculated students and 691 auditors, and in the winter of 1911-1912, 7579.

MUNICIPAL COLLEGES AND UNIVERSITIES.—England.—As education became a function of the state, the tendency was to put the responsibility for elementary education upon the local communities. Gradually that responsibility has been extended to the post-elementary grades. And of late there has been manifest a disposition on the part of great cities to provide the means of higher education rather than to wait for private initiative and the sporadic philanthropy of personal generosity. The municipal colleges of England and the United States are expressive of this high purpose. It must not be understood, however, in speaking of municipal colleges in England, that they are established or maintained by the municipal authorities. In all cases these universities and university colleges have been established by private benefactions and are still maintained largely by private endowment. It is only since the beginning of the present century that the municipalities have been contributing gradually more and more to the maintenance of the institutions in their midst. Further, they take an active part by maintaining scholarships and prizes in the universities, and also have representatives on their governing bodies. The institutions are also civic in the sense that their success is more and more coming to be a matter of local pride, and many of the benefactions are inspired by civic spirit as much as by the desire to promote education. The local universities, chartered within the last few years, are Birmingham, Bristol, Leeds, Liverpool, London (reorganized), Manchester, and Sheffield (*qq.v.*). There are also a number of university colleges, which, however, do not grant degrees: Nottingham, Reading, Southampton (*qq.v.*). To these must be added the constituent bodies which make up the University of Wales (*q.v.*), and the new University of Belfast (*q.v.*), and the colleges of the National University of Ireland (*q.v.*), all of which have strong local affiliations. These civic institutions had their origin in an endeavor "to raise the intellectual level of the town" in which they were placed. But situated, as they are, in the center of England's commercial and

industrial life, and confronted by an intense desire of their students for greater efficiency in these activities, they immediately widened their scope of work and became strongly technological. The government commission, in its report of 1907, complains that it "cannot distinguish between the university and the technical work."

Organization.—The universities and colleges are organized into faculties; *e.g.* at the University of Manchester there are the following faculties: arts, science, law, music, commerce, theology, technology, and medicine, and a department of education. In each faculty ordinary and honors degrees (*q.v.*) are given at the end of a course of three years (except in medicine). While there is a system of election for the ordinary degree course, the subjects are taken in closely allied groups. Each of the universities has the power to inspect and examine schools on request. The northern universities, Manchester, Leeds, Liverpool, and Sheffield, have combined to form a Joint Matriculation Board, which holds a combined entrance examination for the universities and also inspects and examines schools, granting school certificates on the results. The universities are also represented, as a rule, on the governing bodies of local secondary schools and local education committees.

Relation to the Community.—These institutions justify their name, civic universities, because each makes a special effort to meet the economic problems of its city. In Sheffield, for example, the cutlery center of England, the local university has an excellent "School of Metallurgy." "No laboratory is better equipped than this. The manufacture of crucible, Siemens, and Bessemer steel is carried on, on a commercial scale." Leeds is England's textile center. The civic university of that city has a school of "Textile Industries" and another of "Dyeing and Color Chemistry." In Birmingham mining is prominent, and in Manchester "much research work has been done in chemistry and physics and their application to the Cotton City's industries." Industrial England is looking to these civic universities as agents in promoting her economic efficiency or supremacy.

No applicant is admitted to these schools unless he can meet the standards of general culture. These requisites allow a certain amount of election according to a student's previous training. Thus at Manchester English language or literature, English history, and mathematics are compulsory, while a choice of three other subjects (including a foreign language) out of nine is allowed. But there are no prerequisites according to the future work of the students, with the possible exception of medicine. An applicant for a certificate in any branch is not required to meet the same high level of preparation as the young man who seeks a degree.

Financial Support. — The sources of income of these universities can be grouped under the following heads:—

(1) Endowment fund. (2) Private donations to the general fund. (3) Private donations for specific endeavors. Money is frequently given for a library, a special school, a new department, special research, new courses to train for efficiency in some industry. The Clothworkers' Company of London gave the University of Leeds £4000 a year, revocable at pleasure. This donation was made permanent upon the establishment of the "Department of Clothworkers." Such donations are typical of a large number. (4) Student fees. Though the fees are reasonable, an attempt is in process to reduce them further and make them uniform. (5) National government subsidy allotted annually. A regular commission on "Grants in Aid to University Colleges" decided upon a proportional allotment to each institution. These subsidies are usually divided among the universities in proportion to the fund that each can raise from all other sources. (6) The municipal grant. The municipality or the county within whose limits the university is situated makes an annual grant. In many instances the income from the municipal treasury is insignificant in comparison to the other sources.

Students. — These universities are coeducational. Sessions are held at night as well as during the day; those in the industries are thus enabled to take the technical courses. In no universities, however, do evening courses count toward a degree. Many of these students come from distant cities and foreign countries to avail themselves of the specialties of the different universities. No better index of the need of the work of these universities need be offered than their growing popularity. Their influence is shown in the following table:—

	TEACHING STAFF	DAY STUDENTS
University College, London	134	1356
Bristol University	123	700
Manchester University	242	1557
Leeds University	152	901
Liverpool University	219	1078
Birmingham University	148	1017
Sheffield University	150	885
		+ 1818 evening

United States. — In the United States such civic institutions are in a stricter sense municipal colleges. Every Western state maintains its university, which is, not only in its purposed service, but also in its support, public; and many other states contribute largely toward the support of such institutions. But beyond this, cities have made provision of like character. Charleston and Baltimore have for

many decades supported institutions known as "city colleges," but the two most notable examples are the University of Cincinnati (*q.v.*) and the College of the City of New York. The former, made possible by a large private gift, is a consolidation of an original college and neighboring schools of medicine, law, engineering, dentistry, and education. Its student body of 753 college students and 709 professional students, its teaching staff of over 200, and its manifold activities are supported by the original endowment just referred to and in part by city contributions.

The purest type of a municipal college is the College of the City of New York. (See NEW YORK, COLLEGE OF THE CITY OF.) It is governed by trustees appointed by the city, and receives graduates of the city high schools upon certificate. It is a municipal college in the truest sense of the term, for it is supported solely by the city; its unexcelled physical equipment, costing \$5,000,000, was paid for by the city; it is open only to residents of the city who meet the entrance requirements, and to them without fees. In its development it is looking toward fitting young men for highest service to the city.

Germany. — While municipal universities as such have not been established in Germany, there is a tendency for the universities situated in the large towns to flourish in point of numbers at the expense of the small universities. This is further drawing attention to the fact that the largest and wealthiest centers of population are not provided with facilities for higher education. A new era has been inaugurated in this field by the establishment of a university in Frankfort-a-M. (*q.v.*), in which private munificence and the civic authorities had a large share. It is very probable that before long a similar institution will be established at Hamburg. J. H. F.

MUNICIPALITY. — See CITY SCHOOLS; CITY SCHOOL ADMINISTRATION.

MÜNSTER, WESTFÄLISCHE WILHELMS-UNIVERSITY OF, GERMANY. — The present university, although one of the most recent of German foundations, has historical continuity with the Gymnasium Paulinum conducted by the Jesuits at Münster in 1588. Efforts were made to establish a university early in the seventeenth century, and although privileges were obtained from the Pope in 1629 and the Emperor in 1631, nothing more was done. In the next century, however, through the untiring energy of Electoral Prince von Fürstenberg, a Papal Bull and the Emperor's consent were obtained in 1773 for the erection of the university. But the endowments were so poor that the opening with faculties of theology (Catholic), law, and philosophy was delayed until 1780. Chairs in

medicine were added gradually. The numerous wars of the period, however, were a check on progress. Hopes for the future were entertained under Prussian rule, but they came to nothing, since the government decided to found a university at Bonn in 1808, and to close the faculties of law and medicine at Münster, leaving to it only theology and law and the title of *Akademische Lehranstalt*. The work of the institution was thus confined to training Catholic theologians and the few candidates for the higher teaching profession. In 1843 the title of Royal Theological and Philosophical Academy was granted, with university privileges. New chairs were added from time to time after 1858. After 1875 a further development took place; new chairs were created, seminars were added, an auditorium and chemistry laboratory were erected, and an archaeological museum, botanical institute, geographical equipment, and a museum of medical and modern art. In 1900 the Province of Westphalia and the city of Münster raised funds for the local institution, and in 1902 a faculty of law and political science was established and university privileges were granted. In 1907 the title Westfälische Wilhelms-Universität was adopted. A faculty of medicine has not yet been established, but five semesters toward a complete medical course can be completed at the university. The following faculties are now in existence: Catholic theology; law and political science; philosophy (philology-history, mathematics-science, and pharmacy). The enrollment in the winter semester of 1911-1912 was 2314.

MURMELLIUS, JOHANNES (1480-1517).—A Dutch scholar and schoolman; was born in Roermond, Holland, and educated at the schools of Deventer, where he became a pupil of the famous humanist Hegius. From 1498 to 1513 he lived at Münster, Westphalia, where (1509) he was appointed rector of a Latin School. In 1510 he took a similar position in Olkmar, Holland. He was the author of many widely used textbooks, such as the *Pappae puerorum*, a beginners' book in Latin, also an anthology of Latin poets, and a textbook on versification. With Reuchlin (*q.v.*) he took part in the fight against the enemies of humanism. His life has been written by Reichling (Freiburg, 1880), who also published a selection of his Latin poems with a German translation. F. M.

MURRAY, DAVID (1830-1905).—Educator. Graduating from Union College in 1852, served as instructor in Albany Academy (1852-1857) and principal of that institution (1857-1863), and professor in Rutgers College (1863-1873). From 1873 to 1879 he was adviser to the Minister of Public Education in Japan, and from 1880 to 1889 was secretary of the Board of Regents of the University of the State of New York. He was the author of *Land Surveying* (1869), *Japanese Education* (1876), and *History of Education in New Jersey* (1899). W. S. M.

MURRAY, LINDLEY (1745-1826).—

Author of Murray's grammars, readers, and spellers. He was educated in the schools of the Society of Friends, and taught for a short time in a boarding school at Burlington, N.J., and later at Holdgate, near York, England. His *English Grammar* was published in 1795; his *English Reader* in 1779, and his *Spelling Book* in 1804. All these textbooks passed through many editions, with numerous "sequels" and abridgments. His *Autobiography* was published by Elizabeth Frank after his death. W. S. M.

See GRAMMAR; LATIN GRAMMAR.

MURPHY, JOHN J. (1844-1892).—Jesuit educator. He was graduated at Carlow College, Ireland, in 1862, and came to the United States and joined the Society of Jesus four years later. He was instructor and professor in several American Jesuit colleges, and was president of St. Francis Xavier College (1885-1888). He wrote several philosophical papers. W. S. M.

MUSCLE READING.—See MIND READING.

MUSCLES, FUNDAMENTAL AND ACCESSORY.—In the course of animal evolution, the small fine muscles of the body have gradually been evolved by differentiation within the structure of the larger muscles. Thus, the muscles which control the lips of the human mouth have been evolved out of a relatively simple gross muscle, which in the lower forms of animal life controls the mouth opening. The muscles of the hand have become gradually differentiated from the gross muscles controlling the forward extremity of the lower animals. This fact of animal evolution has been cited by students of education as ground for the general principle that the child's muscular training should follow the same genetic order. The grosser muscles should be first brought into action, the finer muscles should be reserved to a later period

of education. This statement with regard to muscular training has sometimes been put in a form which accentuates further the significance of the difference between fundamental and accessory muscles. It has sometimes been said that the finer muscles are immature at the beginning of individual life and unable to perform any work. Such a statement as this last overlooks the fact that even the relatively undeveloped movements of earlier infancy involve the contraction of the finer muscles. Thus the closing of the fist as it appears in every normal infant involves the contraction of all the finer muscles of the hand as well as of the grosser muscles. The contraction of the vocal cords in like fashion involves some of the most delicate muscles of the body. The rolling of the eyes depends upon the contraction of the fine muscles of the eye.

In the early stages, however, these fine muscles are not capable of acting in such a way as to produce complex or highly differentiated coordinations. Thus it is quite impossible to move one of the fingers at this early stage in a direction different from the general movement which is being made by all of the fingers of the hand. While the fine muscles are thus capable of contraction, they are not capable of highly differentiated movements. The distinction should be made, therefore, not between the small muscles and the large muscles, but between the fine differentiated coordinations and the grosser coordinations. The development of the fine differentiated coordinations is undoubtedly slow and requires sensory and motor control of a very highly organized type.

C. H. J.

See COÖRDINATIONS.

MUSCULAR SENSE. — The organs of movement, especially the joints and muscles, are provided with sensory nerve fibers which send to the central nervous system sensory currents whenever the limbs or other muscular organs of the body are moved. The significance of motor processes for mental development has long been recognized in psychological writing. The muscle sensations have been described by such writers as Bain and Wundt as avenues through which bodily movements contribute to mental development.

MUSÉE PÉDAGOGIQUE. — See FRANCE, EDUCATION IN; MUSEUMS, EDUCATIONAL.

MUSEUMS, EDUCATIONAL. — The educational museum may be defined as an institution to conserve and display collections which have an illustrative, comparative, or criti-

cal relation to the schools and to school work, or which are concerned with education as a profession, a science, or a social institution. The mention of a confusion in the use of the term "educational museum" will make its proper significance more clear. Museums located in a school or organized as an adjunct to a system of schools, and aiming to aid school instruction directly and immediately, are sometimes called "educational museums." Their contents are related to education; but since their collections are designed as a supplementary agency in instruction, they may better be called "school museums." They can be sharply distinguished from the "educational museum"; the school museum is itself didactic, it exists for the pupil directly; it includes only the means of teaching, that is, the apparatus, appliances, and materials of teaching brought together for use in actual instruction. Distinguished from the school museum is the type of museum which is related to education as an institution, a profession, or a science, rather than to actual teaching; which exists not for the pupil, but for the teacher, the person interested in school administration, the student of education, and the general public; the collections of which illustrate not only the means and appliances of education (and these not to be used in teaching, but to be studied and considered for themselves), but in addition, it may be, the methods of education, its results, its organization and administration.

The function of the educational museum may also be defined by comparison with the educational library, the educational laboratory, the model school, and the school exhibit and exhibition. The educational library contains all printed material relating to education; the educational museum contains all objective collections; the museum, however, includes all printed material more properly treated as exhibits for inspection or as gross data for elaboration, than as books for circulation; namely, collections of school textbooks, teaching manuals, archives of school catalogues and reports, and perhaps bulky illustrated works, as on school architecture. The educational laboratory undertakes investigations in education, and gathers books and objective collections as demanded by these investigations; it has no function of public visitation, as the museum, or of circulation of its resources, as the library; its activities are centered in its scientific studies. The model school or practice school of an institution for training teachers might be called a dynamic museum of education. By the school exhibit is ordinarily signified a temporary display of the results of pupils' work, together with the school building and its equipment, usually opened to the public for one or more days at the end of the school year. The school exhibition or exposition is a centralized display of such exhibits, chiefly including samples of

pupils' work, brought together for a city or larger district for a longer or a shorter time; organized, it may be, independently or in connection with some industrial exposition. Such educational expositions often include manufacturers' exhibits of teaching appliances, school furniture, textbooks, and other materials. In so far as these exhibitions bring together displays which have been prepared disinterestedly, so far they do temporarily part of what educational museums do permanently. In so far as manufacturers' exhibits enter on a competitive basis, the exposition is of a different genus from that of the educational museum. (See EXPOSITIONS, INTERNATIONAL, AND EDUCATION; EXHIBITIONS, SCHOOL.)

There have been seventy-five or more educational museums projected in some twenty-five different countries since 1850. Credit for the first one is due to Egerton Ryerson, Provincial Superintendent of Education for Ontario, Canada, who in 1845 was granted £100 to purchase samples of school models, copies of which he had seen in American schools and which he thought Canadian manufacturers might duplicate. The collection of school aids became part of the Canadian Museum, opened at Toronto in 1856, and afterward known as the Educational Museum, until 1897, when the name Provincial Museum was assumed. At about the latter date the last purely educational exhibits were retired from the museum. The educational collections at Toronto realized certain important results: they distinctly improved the teaching equipment of the schools of the province both through force of example and by the direct agency of the government in selling to the schools duplicates of the exhibits shown; they led, within ten years, to Canadian manufacture of teaching materials, school desks, and other requisites, so that the depository and sales bureau of the government could later be dispensed with; they influenced American schools through the visits of various American teachers, especially through the stimulus given to Principal Sheldon (*q.v.*) of the Oswego Normal School, who inspected the Toronto collections about 1860 and as a consequence initiated the "Oswego movement" (*q.v.*) in American education.

Though the idea of a museum of education is claimed for the French school inspector, Jullien, who wrote about 1817, the Crystal Palace Exhibition in London in 1851 assuredly gave the stimulus to the first two European educational museums,—the Collection of Teaching Appliances of the Royal Bureau of Commerce and Industry for Württemberg, organized at Stuttgart in 1851 and still forming a section of the National Industrial Museum in that city; and the Educational Section of the South Kensington Museum, London, 1857–1888. Indeed, a large proportion of educational museums owe their beginnings to the

educational sections of international expositions. A survey of the educational museums of the world is the basis for the following statement of their usual collections and activities.

Such exhibits may be organized according to (1) the progressive stages of school work, the kindergarten, the elementary grades in turn, and higher education; or (2) the subjects of instruction, as geography, history, industrial arts, or what not. Both schemes of classification have been followed; each has its obvious advantages. These materials of instruction, including textbooks as well as "aids," appliances, illustrations, material, and teaching equipment of all sorts, the teacher's tools in short, form the item of first importance in a dynamic museum, one that seeks to improve teaching. It is significant that in the statutes of sixty-seven museums, assistance to teachers is mentioned by forty-two as their first aim, and the collection and exhibit of teaching appliances by fifty-seven as their most important work. The collection of teaching appliances is made vital by the effort to secure new and improved types as soon as they come upon the market, and by prompt criticisms in the educational press, while in a few cases museums have sent out traveling exhibits of new appliances that teachers may see the latest and best.

With emphasis upon new and improved appliances, one in five museums at least plans to include foreign exhibits, thus looking to that international exchange of ideas so important to educational progress. Some striking instances of this international movement in educational ideas are afforded by the Toronto, Tokyo, and South American museums. It might be urged that these museums all aided in the improvement of education in new countries; the French and German museums, however, show that the educational museum has still a function for progress even in advanced countries.

The next most common exhibits are those of the school building and its furnishings. The comparative study of architecture, or, to mention a more limited topic, the school desk, could be facilitated by the aid of the educational museum, and either topic is worthy of research. The school building itself forms a division in most educational museums, illustrated by architects' drawings and blue prints of floor plans, elevations, and their details. Such exhibits make possible a comparative study of the school plant, and may extend the adoption of good architecture. Such collections furnish the necessary foundation to treatises upon school architecture, which ought to be more than compilations of pictures, and should offer wise criticism based on wide comparisons.

Other exhibits mentioned in the plans of different museums are the following: those illustrating school organization as record blanks

and reports; samples of pupils' work, to illustrate the results of instruction; historical exhibits—a feature in one in four of the museums; an educational library, an historical library, archives of school reports, collections of textbooks, of children's literature, and of school and other pictures. Two or three of these items merit an extended notice.

Exhibits of children's work, the immediate material results of the teaching process, have had small place, usually, in educational museums. They have always been a large feature of temporary educational exhibitions. Usually regarded as of ephemeral value, these exhibits have in a few instances, notably the Paris museum, been created into permanent displays. Their utility resides in the possibility which they afford of comparisons of progress in the schools; to be reliable for this purpose, they must be originally compiled with accuracy and under known conditions. Limited in amount, and organized in albums, such exhibits of children's regular school work, or perhaps of the results of tests and examinations, might become educational records of great value.

Historical exhibits of various kinds have been made. Some of these are memorials of educators, as the collection in the *Deutsches Schulmuseum* in Berlin, and the collection of physics apparatus made and used by Professor Schaeffer at Jena, and now maintained there as a memorial to him. Most striking of all are the Pestalozzi memorials at Zurich and the Comenius collection at Prague, while the great educational library at Leipzig, the *Pädagogisches Zentral (Comenius-Stiftung)*, although not a museum primarily, is in itself a memorial of this type. Very suggestive as a type of possible historical exhibit is the Hamburg School-History Collection, which by means of prints, photographs, pupils' books, textbooks, old school reports, and the like represents the development of local education. Any community might in a similar simple way preserve within its main school building such memorials of its own educational history. Another type of historical exhibit is that illustrating the development of particular school subjects, as the Breslau museum display illustrating the evolution of charts and other appliances for religious education and for the teaching of mathematics. In this category, too, belong the unique historical collections of manuscripts and textbooks of arithmetic, grammar, readers beginning with hornbooks, penmanship, and other school subjects, in the private library of George A. Plimpton, Esq., of New York.

Special collections are features of some museums: sometimes collections of local natural history or industry, often exhibits of school art and schoolroom decoration, school hygiene, pictorial collections, or teaching materials for individual subjects, as religion, arithmetic, or drawing. In a few in-

stances, educational museums devoted entirely to a limited field have been proposed: as, the projected museum of Froebel memorials at Eisenach; the museum of industrial education at Frankfurt (1900-1902); and that of deaf-mute education at Leipzig.

The educational library is the natural adjunct to the museum. There is some sort of book collection with practically every museum. The Paris and the Berlin city museums have each a large library; and others have frequently 5000 or more volumes. These libraries comprise books on education, textbooks, teachers' manuals, and the archives of school reports, regulations, programs, and like invaluable documentary records. The possibilities of the last-named item are indicated by the collection of several thousand serial catalogues and reports, annually augmented, on file in the Educational Library of New York State. Special book collections are found with certain museums: catalogues and books relating to teaching appliances; children's books; in many cases, reading rooms with educational journals on file. (See LIBRARIES, EDUCATIONAL.)

Another view of the educational museum as an institution may be secured by observing its activities. Over half the museums loan out exhibits, in a few cases directly into the schools; in other cases to teachers and school officials for inspection and study. The St. Petersburg museum made a striking exhibit at the Centennial Exhibition in Philadelphia in 1876; the Rostock museum sends parcels of new teaching appliances over four different circuits, to forty-four different places of exhibit; and the Copenhagen museum has circulated exhibits and arranged accompanying lectures on school architecture, hygiene, etc. Lantern slides are loaned for purposes of instruction by several museums. The loan of books from the libraries is common. Temporary exhibitions are held by three fourths of the museums, and on such subjects as: children's literature, history of schools or of education, pictures and school decoration, manufacturers' loan exhibits of teaching appliances in special subjects as geography and drawing, exhibit of pupils' work in manual training and other subjects. The Paris museum has a section for publishers' loans in each of its departments; the Amsterdam museum has definite regulations governing manufacturers' loans; the Rio de Janeiro museum has as one feature an annual exhibit of pupils' work. The number of visitors is another measure of a museum's usefulness; the "mean" attendance for forty museums was from 1000 to 1500 per annum. Especially significant are visits by teachers and pupil teachers preparing for examinations, and by members of seminar classes, as is common in the German museums.

Publications of some form other than catalogues are issued by many museums:

(a) a periodical, in some cases a separate paper or perhaps a supplement or page in an educational journal which reports accessions, exhibitions, criticisms, etc.; (b) monograph studies giving historical material or the results of investigations have been issued by six museums at least; (c) school materials, whether books, new types of teaching appliances, or even, in one case, a school desk, have been brought out by certain museums in the effort to improve teaching equipment. The furnishing of information has been stated as the broad aim of these museums, and many serve as veritable bureaus of educational information for the territory they reach.

Finally, instruction for self-improvement, lecture courses, and even laboratory courses in natural science have been provided by some museums for teachers and pupil teachers, emphasizing that the museums exist for the teacher, and especially for the teacher in training. Significant to this same end is the tendency of educational museums to ally themselves with institutions for training teachers: the Toronto museum was connected with a normal school, the Tokyo museum has been annexed to the higher normal school; the director of the Paris museum has recently suggested affiliation with the University of Paris and the normal schools; in the university schools of education there has been a sentiment in favor of the organization of collections which may stand to educational research as do the natural history collections and historical archives to scientific and historical study. Herein, perhaps, lies the most promising function of the educational museum.

List of Educational Museums. The names are arranged by countries in alphabetic order. The first date indicates the year of opening; the second date, if given, the year of closing.

Argentine Republic. — 1. Buenos Ayres. *Biblioteca y Museo pedagógicos*, 1888.

Austria-Hungary. — 2. Agram. *Hrvatski Skolski Muzej*, 1901. 3. Bozen. *Ständige Lehrmittelausstellung*, 1889. 4. Budapest. *Országos Tanterm-museum*, 1877. 5. Graz. *Permanente Lehrmittelausstellung*, 1882. 6. Innsbruck. *Ständige Lehrmittelausstellung*, 1888. 7. Laibach. *Schulmuseum und Ständige Lehrmittelausstellung*, 1898. 8. Prague. *Sídí skolni vystava v Praze*, 1890. 9. Vienna. *Permanente Lehrmittelausstellung der Stadt Wien*, 1872-1892. 10. Vienna. *Oesterreichisches Schulmuseum*, 1903. 11. Vienna. *Permanente Lehrmittelausstellung der Gesellschaft Lehrmittellentrale*, 1905.

Belgium. — 12. Brussels. *Musée scolaire National*, 1880. *Brazil.* — 13. Rio de Janeiro. *Museu escolar nacional*, 1883.

Bulgaria. — 14. Sofia. *Ucilisten Muzej*, 1905.

Canada. — 15. Toronto. *Educational Museum*, 1845-1881; now *Provincial Museum*.

Chile. — 16. Santiago. *Museo de Educación Nacional*, 1911. *Denmark.* — 17. Copenhagen. *Dansk Skolemuseum*, 1887.

France. — 18. Chartres. *Educational Museum and Library*. 19. Paris. *Musée pédagogique*, 1879.

Germany. — 20. Augsburg. *Die Schwäbische permanente Schullausstellung in Augsburg*, 1881. 21.

Bamberg. *Die Permanente Lehrmittelausstellung in Bamberg*, 1896. 22. Berlin. *Das Deutsche Schulmuseum in Berlin*, 1876. 23. Berlin. *Das Städtische Schulmuseum in Berlin*, 1877. 24. Bremen. *Das Schulmuseum des Bremischen Lehrervereins*, 1902. 25. Breslau. *Das städtische Schulmuseum in Breslau*, 1891. 26. Cologne. *Die städtische Lehrmittelsammlung in Köln a. Rh.*, 1901. 27. Donauwörth. *Die Permanente Lehrmittelausstellung des Cassaneums in Donauwörth*, 1876-1884. 28. Danzig. *Die Danziger Lehrmittelsammlung*, 1904. 29. Dresden. *Das heimatkundliche Schulmuseum in Dresden*, 1905. 30. Dresden. *Das Schulmuseum des Sächsischen Lehrervereins in Dresden*, 1904. 31. Eisenach. *Das Proebel Museum* (projected). 32. Frankfurt. *Das Frankfurter Gewerbeschulmuseum*, 1900-1902. 33. Glewitz. *Das Oberschlesische Schulmuseum in Glewitz*, 1905. 34. Gotha. *Das Gothaische Schulmuseum*, 1889. 35. Hamburg. *Die Hamburger Lehrmittelausstellung*, 1897. 36. Hamburg. *Die Schulgeschichtliche Sammlung d. Schulwissenschaftlichen Bildungsvereins*, 1897. 37. Hannover. *Das Städtische Schulmuseum in Hannover*, 1892. 38. Hildesheim. *Das Schulmuseum (die Leckerhühnung) in Hildesheim*, 1891. 39. Jena. *Das Thüringer Schulmuseum in Jena*, 1889-1897. 40. Jena. *Das Schaeffer Museum*, 1900. 41. Kiel. *Das Schleswig-holsteinische Schulmuseum in Kiel*, 1890. 42. Königsberg. *Das Schulmuseum des Königsberger Lehrervereins, die Städtische Bibliothek für die Volksschullehrer*, 1881. 43. Kolberg. *Das Schulmuseum in Kolberg*, 1904. 44. Leipzig. *Die Permanente Ausstellung von Lehrmitteln in Leipzig*, 1865-1875. 45. Leipzig. *Deutsches Museum für Taubstummenbildung*, 1895. 46. Magdeburg. *Die Lehrmittelausstellung des Lehrerverbandes der Provinz Sachsen in Magdeburg*, 1877. 47. Munich. *Das Königliche Krcemagazin von Oberbayern für Lehrmittel und Schuleinrichtungsgegenstände in München*, 1875. 48. Oldenburg. *Das Schulmuseum zu Oldenburg i. Grossh.*, 1900. 49. Posen. *Das Posener Schulmuseum*, 1897. 50. Regensburg. *Die Oberpfälzische permanente Kreis-Lehrmittelausstellung in Regensburg*, 1880. 51. Rixdorf. *Das Naturhistorische Schulmuseum der Stadtgemeinde Rixdorf*, 1897. 52. Rostock. *Das Mecklenburgische Volkschulmuseum in Rostock*, 1888. 53. Stuttgart. *Die Lehrmittelsammlung der Königlich Württembergischen Zentralstelle für Gewerbe und Handel in Stuttgart*, 1851. 54. Wolfenbüttel. *Das Landes-Schulmuseum für das Herzogtum Braunschweig in Wolfenbüttel*, 1892.

Great Britain. — 55. London. *Educational Section of South Kensington Museum*, 1857-1888. 56. London. *Educational Museum of Teachers' Guild*, 1892.

Greece. — 57. Athens. *Ἐκπαιδευτικὸν Μομεῖον*, 1905. *Italy.* — 58. Genoa. *Civico Museo pedagogico e scolastico*, 1881. 59. Rome. *Museo d'Istruzione e d'Educazione*, 1874-1881.

Japan. — 60. Tokyo. *Kokoku-kakubutsukan*, 1878. *Netherlands.* — 61. Amsterdam. *Nederlandsch Schoolmuseum*, 1877. 62. Hague. *Museum ten bate van het Onderwijs*. (Projected.)

Norway. — 63. Christiania. *Skolemuseum for Kristiania Folkeskoler*, 1901.

Portugal. — 64. Lisbon. *Museu pedagógico de Lisboa*, 1883.

Russia. — 65. St Petersburg. *Pedagogiceskij Muzej voennouchebnykh zavedenij*, 1864.

Servia. — 66. Belgrade. *Skolski muzej*, 1898.

Spain. — 67. Madrid. *Museo pedagógico nacional*, 1884.

Switzerland. — 68. Bern. *Schweizer. permanente Schullausstellung*, 1878. 69. Freiburg. *Musée pédagogique suisse de Fribourg*, 1884. 70. Lausanne. *Musée scolaire cantonal Vaudois*, 1901. 71. Lucerne. *Permanente Schullausstellung*, 1905. 72. Neuchâtel. *Exposition scolaire cantonale permanente*, 1887. 73. Zürich. *Pestalozzianum*, 1876.

United States of America. — 74. New York. Teachers College, Columbia University, 1899. 75. Washington. U. S. Bureau of Education, 1876-1906. In addition, museums or permanent exhibits of educational material have been contemplated or provisionally organized within the United States, by the city school systems of St. Louis, New York, New Haven, Connecticut, and Reading, Pa., by the state museums of New Jersey, Pennsylvania, and Louisiana; by the State Education Departments of New York, Massachusetts, and some other states; by departments of education in the following universities: California, Clark, Harvard, Illinois, and Indiana; and by societies or associations: a geography exhibit by the Brooklyn, New York, Institute of Arts and Sciences, and a religious education exhibition by the Sunday School Commission of the Episcopal Church Diocese of New York, and by the Religious Education Association.

Uruguay. — 76. Montevideo. *Museo y Biblioteca pedagógicas*, 1889. B. R. A.

MUSEUMS, SCHOOL. — Quite apart from formal laboratory equipment and materials on the one hand, and the usual school tools, as slates, books, pencils, on the other, there exists a broad field of illustrative materials, pictures, specimens, models, what not, used in instruction, the organization and care of which constitutes the province of the school museum. Its divisions may be as many as the subjects of instruction which are capable of objective illustration. American schools, while emphasizing laboratory methods and the use of textbooks and other tools of teaching, have done less than European schools to utilize illustrative materials.

The simplest "school museum" is the school-room collection made by the teacher or by the pupils themselves to illustrate the subjects of study, geography, history, or nature study.

The saying that the usefulness of the school museum is in its making, not in its use, refers to collections made by pupils; it is an axiom of partial application, however, for the room collection should grow from year to year and receive adult curatorship. The room collection merits suitable accommodation: a good-sized cupboard with glass doors above for display, a vertical-file drawer 11 by 14 inches at least in section, with alphabet guides for the picture collection, and other drawers both shallow and deep for the storage of objects. Such a room collection will furnish material of increasing value each year for illustrating topics in the course of study and for arranging occasional small exhibits by the pupils, who will get valuable training in its care as well as knowledge by its use.

Room collections may be brought together for a school building into a "school museum" proper, as books are centralized in a library. Indeed, the school museum is a "library of objects," and may be administered with the school library. The essentials are a well-lighted room with (a) a few exhibit cases of suitable height for changing displays, arranged now by the librarian or curator, now by this grade or that as illustrative problems for the enjoyment of the whole school; and (b) ample storage facilities for the systematic care of (1) pictures, photographs, magazine illustrations even, in properly indexed vertical-file drawers; (2) lantern slides arranged on shelves in long boxes which convert them into vertical-file records as easily classified as a library card catalogue itself; similarly, stereoscopic views, and a set of illustrations for the projectoscope if the reflecting lantern is used; (3) a collection of objects, minerals, woods, and other nature materials, textiles and other industrial materials, models, maps, charts, etc., stored compactly and systematically in drawers and cupboards without display; and (4) living exhibits, a vivarium to include plants, animals, birds, fish, etc., especially in urban schools. For the objective collections there is perhaps no better method of classification than by general subject numbers, as, e.g., in the Dewey library classification, with sequence numbers 1, 2, 3 . . . within groups; or sequence numbers alone may be used. In either case a card catalogue with direct and cross references will be useful, and in a large collection indispensable. Such a school museum is (1) a supply bureau for illustrative materials to be taken into classrooms and used in teaching; (2) a room where pupils may secure information at first hand from concrete materials, as in the library from books; (3) a display room for changing exhibits (the fixed unchanged exhibit, be it of ever so much initial interest, is soon dead material); and (4) an important avenue for the expressive activity of pupils in organizing exhibits for their own rooms, or within the museum itself.

The third stage in the school museum is the central loaning bureau of teaching materials for a system of schools, organized with or without exhibit rooms. The central depository and loan bureau is best illustrated by the "Educational Museum" so-called, the school museum of the St. Louis schools. Organized in 1905, this museum reaches by weekly wagon delivery and collection over 100 school buildings of the city, with selections made on previous order from its rich and varied collections. There are over 1000 separate collections (objects, mounted specimens, pictures, charts, lantern slides, stereoscopic views), many of them in duplicate so that several schools can have the same exhibit at one time, which furnish illustrations of "food, clothing, natural objects, industrial objects, animals, plants, minerals, national life, physical geography, physics, history, astronomy, physiology." Brief descriptions accompany the exhibits, with titles of reference books. A detailed catalogue of the museum is put in the hands of every teacher, and its service is regarded highly. Certain exhibits which cannot be transported to the schools are available for inspection by teachers and principals at the museum. A similar bureau, though more limited in scope, was organized by the teachers of geography in the Chicago schools a few years ago, and was then taken over by the Chicago Normal School. Similar foreign experience, for example the school museum conducted for many years by the School Science Education Association at Hamburg, and the circulating materials in the Liverpool schools, might be cited. The possibilities in a state bureau for circulating materials among schools are suggested by the activities of the New York State Education Department in loaning framed and unframed pictures and lantern slides, and in depositing slides permanently with school authorities. Similar slide loaning services have been organized elsewhere: the Musée Pédagogique in Paris, Teachers' Guild Museum in London, and Educational Museum in St. Petersburg are examples.

Traveling Museums. — The museum which as an institution has its activities primarily limited by its own walls, has widely extended its usefulness by the development of circulating collections or traveling museums. The natural history collections which are sent out from the central museum and reach the children in their own schoolrooms is one example of the traveling museum; the great English loaning system centering in the Victoria and Albert Museum is another, with its traveling exhibits of woods, metals, textiles, science specimens, and apparatus, and samples of art and art industrial work. Commercial agencies have often employed the traveling museum: the school decoration movement in the United States received great impetus from the local display by publishing

houses of pictures and casts, the receipts of which went for the purchase of selections for the schools; the state governments have sometimes sent over the country samples of their products to attract settlers. The traveling exhibit has been found most effective in social education; the anti-tuberculosis crusade has possibly achieved as much by its exhibits as by any one agency. The New York State system of loaning photographs and slides; the art movement in certain states, taking the form of circulating art exhibits; and more recently the development of agriculture extension education by means of demonstration railroad trains are other examples of successful traveling museum work. The demonstration trains usually contain not only accommodations for lectures and demonstrations, but exhibits which enforce lessons in farm management, improved equipment, and other subjects by means of striking diagrams, models, charts, and other objective displays. Education itself has utilized traveling exhibits as a means of improvement and progress in teaching, as in the art and industrial art exhibits often circulated by state departments of education and by teachers' associations, for the benefit of local teachers. The influence of museum extension in schools is making itself felt, and a demand for exhibits is being made by rural districts. Thus in Illinois the Illinois Audubon Society has arranged to send out free of charge four traveling libraries, four bird picture collections, and two lantern slide collections, with accompanying lectures. Seeing is believing, and the effectiveness of objective examples is unquestioned as an aid in the learning process, whether with children or with adults.

Relations of Public Museums to Schools.

— Related in educational function to the school museum are the activities of general museums of art, science, and natural history in placing their resources at the service of schools, both in elementary and secondary education and in advanced technical education. The value of museums, whether of art or science, in education is a subject which has been receiving ever increasing attention during the past ten years by museum officials in Europe and in America, as may be seen by a reference to the bibliography. In England the large and varied collections of the Victoria and Albert Museum are lent to prominent museums, and to art and other types of schools. The first systematic attempt to bring about a recognition of the educational functions of museums was made in France in 1880, when a commission was appointed by the Minister of Public Instruction to take the necessary steps preparatory to the introduction of arts into schools. In Germany, according to David Murray, "museums are made the basis of instruction, and every subject which can be made intelligible by means of a museum is provided with a teacher." Excellent work is done in this field in the lower

grades of public schools in Hamburg through the influence of Dr. A. Lichtmark, director of the Kunsthalle. Other prominent leaders have been George Hirsch, author of *Ideas Concerning the Teaching of Drawing and Professional Art Education* (1887), and Professor Konrad Lange of the University of Königsberg and later of Tübingen. In the United States the question of the relation between museums and schools was not actively considered until the appointment of a Committee on the Utilization of Museums of Art by Schools and Colleges. The direct methods of the committee included formal lectures in museums, or peripatetic conversations, the employment of "docents" or trained guides, and traveling exhibits. Indirect methods include printed lectures, stereopticon illustrations, and photographic reproductions. This system, largely inspired by Mr. M. S. Pritchard, was put into practice at the Boston Museum.

Another impulse toward the use of museums of art was given by the demand in most countries for better schoolroom decorations. Cheap casts, photographs, and lantern slides were placed in the schools, and the possibility of employing greatly improved illustrative materials became apparent. From these collections to museum collections was but a step, and now the stage where the difference between reproductions and originals is being understood has been reached.

The utilization of museums for the study of art has, however, not been so great as in the scientific lessons. The value of specimens in such studies as natural history and physical geography, and of laboratory practice, was encouraged by the Agassiz Association and certain modern textbooks. The new relation between schools and museums has led to the creation of a new office, that of the museum instructor who meets teachers and pupils and shows them the collections or instructs them in such subjects as may be desired. Special rooms have been provided for teachers and pupils for talks by the teacher or instructor; photographs and lantern slides are more widely used and lent out; special children's collections have been arranged, and special lecture courses intended for school pupils are given. Lastly, many museums coöperate actively with the school boards of their communities, and in return for financial support provide for the special relations with the schools.

Museum collections can reach the school child in two ways: exhibits may be taken to the schoolroom, or the pupil may be taken to the museum. Both types of effort are admirably illustrated by work undertaken for the schools by the American Museum of Natural History of New York City. This museum circulates week by week, by messenger, nearly 500 small cases, each containing a unit exhibit illustrating birds, insects, woods, or minerals, which have been studied in a

single year by over a million children in 400 different school buildings; and fifty similar cases are rented to the schools of a neighboring city. Besides lectures given at the museum for the general public, a course of illustrated lectures is given for school children who come at stated times in groups with their teachers, forming audiences of 500 and upwards; special lectures are occasionally given by the staff at the request of teachers, who are also allowed to give lectures, illustrated with the museum's lantern slides, to their pupils. A "Children's Room" is provided, with a special instructor in charge, who also gives assistance to classes of children visiting the museum to study exhibits. Formal instruction is carried even further in the Milwaukee Public Museum, where a special teacher appointed by the board of education devotes her time to instructing classes of children coming in regular rotation from the schools. The "children's room," as a feature of museum work, with exhibits with special labels particularly arranged for children, was suggested first perhaps in the U. S. National Museum (*q.v.*) in Washington, where it had, however, no relation to school work; this idea finds its best expression at present in the Children's Museum, Bedford Park, Brooklyn, a branch of the Brooklyn Museum of Arts and Sciences which, while not under the direction of the schools, attempts to relate its work to that of the schools. Here is an institution with exhibits in various divisions of natural history, wholly devoted to children; its aim is to "stimulate the interest of young people," and specifically "to provide collections and working materials . . . to be immediately helpful to teachers who come to the museum with classes for the supplementary study of special subjects pursued in school." In addition to exhibits within the museum, and a limited amount of loan material, a library and reading room are correlated with the exhibits, and the museum provides a lecture room where teachers may present topics to their classes with lantern illustrations, and where lectures will be given by members of the museum's staff on request. The museum of the Buffalo Society of Natural Sciences and the Fairbanks Museum at St. Johnsbury, Vt., have coöperated with the schools very successfully. The Philadelphia Museums, while encouraging systematic visitation by school classes, have distributed from their duplicate materials small exhibits to the schools as permanent teaching collections, a form of coöperation practiced by many other museums.

In Chicago, through the influence of Professor T. C. Chamberlain, the Academy of Sciences since 1909 has arranged one hundred museum loan collections for the use of public and private schools of the city. During 1911 279 loans were made to forty-four schools, and it is estimated that in this way 20,000 children have been reached. Free instruction courses are

offered to children, and many schools and classes send representatives who later report at the school. Courses are also arranged for teachers. Thus, the Woman's Club has installed civic and health exhibits; and work of a similar kind is being done by the School of Civics and Philanthropy, Municipal Art League, Council for Museum and Library Extension, and other bodies. In 1912 a bequest of \$250,000 was made to the Field Museum for the special purpose of museum extension in the public schools. (See *Science*, Feb. 16, 1912, pp. 261-262.)

The simplest coöperation perhaps has been the encouragement of informal visitation by teachers and pupils whenever the museum promises to be of help in their work; thus the Metropolitan Museum of Art of New York has called the attention of teachers to possible applications of the collections in their language, art, and history instruction; the Carnegie Museum of Pittsburgh and other museums have sought to increase informal visitation by means of annual prize essay contests open to school children, with topics based on the collections. Coöperation between public museums and public schools is yet to be developed in many respects: the organization of branch museums comparable to branch libraries, perhaps located in school buildings; the writing of suitable "penny guides" for children which will give surveys of fields of science and other expositions based upon the exhibits; the place of changing exhibits within the museum, correlated with the course of study of the schools; the possibilities of oral instruction within the museum, either in lectures or in peripatetic explanations of exhibits; exhibits and instruction for teachers as distinct from pupils. That this field is one rich in possibilities for school and museum alike is evidenced by the success attending loan exhibits sent to schools, lectures for classes from the schools, and special exhibits, rooms, and museums for children.

Museums and Higher Technical Education.—The place of museums in higher technical education is more striking than in public elementary and secondary education, and especially in the three higher fields of fine arts, the industries, and industrial art. The museum of fine arts which exists in practically every large center of population has often a formal school of art attached, and is nearly always a place of informal art education. The industrial museum is one which displays industrial products; a museum with exhibits representing the whole field of industry, however, would be impossible of realization; some principle for the selection of exhibits is necessary, and this may be historical, technical, or artistic. The exhibits in the National Museum at Washington, for example, illustrating the development of artificial illumination from ancient lamps to electricity, or the evolution of fire-

arms, offer interesting historical data and suggest the significance for history of well-organized exhibits illustrating the industry of the past. Collections made for technical purposes are those which seek to improve industry in a limited field by more or less inclusive exhibits of materials, tools, machines, methods, and products. Finally, industrial objects may be selected for exhibition because of artistic rather than technical merit; such collections form an industrial art museum as distinguished from the industrial museum in which technical interest predominates. The industrial museum aims to increase technical proficiency in industry; the industrial art museum, to increase the element of beauty in industrial products. The relation of museum collections in fine art, industrial art, and industrial technique to education in these fields is obvious enough. Concrete examples of the best man has hitherto done are the necessary stimulus and basis to further progress.

Europe has appreciated this better than America up to the present. There is scarcely an industrial center in Europe but has its collections intended to improve general taste, as with us, but also used specifically to aid workers in fine arts and increase the skill of the artisan and the beauty of his useful product. A city like Leipzig, for example, has the following museums: City Museum of Graphic Arts, Industrial Art Museum, with collections in metal, wood, ceramics, textiles, etc., Museum of the German Book Trade, besides two historical museums, the university collections and certain others. Düsseldorf, art and industrial center, has the Fine Art Collections of the Royal Art Academy, the Industrial Art Museum, which is controlled by an industrial association, and an art hall for exhibitions. In Dresden there are the Royal Collections for Art and Science, and the Royal Museum of Industrial Art, connected with the Royal Academy of Industrial Art, besides many minor collections. Chemnitz has the Industrial Museum of the Artisans' Association, with a collection of 9000 objects "to advance the skill of workers," and a city collection of models managed by the Industrial Union and aided by a grant from the city "to advance local industry especially in regard to artistic taste"; both exhibits represent local industries. Crefeld has a collection of the Association for the Advancement of the Textile Industry, started in 1902, which shortly had over 25,000 samples illustrating carpets, upholstery, modern silks, etc., and receives large accessions each year. One might cite the large museums and collections of Berlin, Stuttgart, and Munich, representing local and national industries; the example of the smaller centers, however, illustrates even better the wide diffusion of the museum in the system of art and industrial education. The Bremen commercial collections merit the motto: "Here learn how

Bremen prepares her sons for world commerce." Museums indeed form one absolutely essential element in the great German organization for industrial progress. Not only do the technical and art schools depend upon the museum collections, with which they usually stand in close connection, but the individual artisan works within the museum and takes out drawing plates, objects, etc. for study. In Düsseldorf, for example, the Industrial Art Museum loaned 200,000 illustrations and 64,000 objects in the first twenty years of its existence.

In France, Switzerland, Italy, and England one finds that museum collections are similarly utilized in higher technical education. The example of England is suggestive, particularly in two respects, first in the large number of local museums, and second in their close relationship to the great Victoria and Albert Museum in London. This relationship is evidenced especially by the very efficient loaning service maintained by the museum in London, and similarly by the Dublin Museum, which send out selected exhibits to the local and provincial museums, to educational exhibitions, and, what is more significant, to art and technical schools, "as examples likely to be useful to their classes in which training in art crafts is given." These loan collections are veritable traveling museums which reach every industrial center in Great Britain.

In the United States natural history and art museums have been organized widely, and have reacted upon science and art teaching. The industrial and industrial art museums, however, are thus far few in number. Industrial art objects find a place in many art museums, however, as in the architectural, woodcarving, glass, and other sections of the Metropolitan Museum of New York; and industrial collections are to be found in certain general museums, as the National Museum at Washington. The best American example of an industrial art collection is perhaps the Pennsylvania Museum and School of Industrial Art, Philadelphia. This institution, organized just after the Centennial Exposition, maintains significant collections in fine arts and particularly in industrial arts, with departments of numismatics, textiles, goldsmith's work, oriental pottery, American pottery, arms, musical instruments, sculpture, furniture, prints, philately; it also conducts an important School of industrial arts, which includes a school of design and a textile school, the latter, one of the leading American schools of textile technology. Another growing industrial art collection is the Museum of the Arts of Decoration of the Cooper Union, New York City. The United States will need a great museum of industrial art alongside of every great industrial school, and industrial and industrial art collections in every industrial center if we are seriously to use education for technical and artistic progress. MUSIC AND MUSICAL TERMS.—Whenever and wherever music has been included in academic curricula, rhythm and harmony have been the main subjects of study. Counterpoint was at first included under the general term "harmony," but since the rise of the modern conception of harmony, counterpoint has been recognized as a distinct subject of study. Rhythm, in its broader sense, has almost vanished as a specific study, but its narrow, mechanically conceived metric phase is included in the study of *form*. Until within a very few years the only academic studies have been harmony and counterpoint, pursued, generally, in the order named. This is an anomaly when we stop to consider the relation of melody to harmony, and note the fact that the modern chordal system is the outgrowth of a highly developed melodic imagination embodied in counterpoint. Strictly speaking, therefore, there should be no separate study of these two eternally wedded elements of music; but out of a free melodic development of harmony, in its legitimate signification as tonality, should be evolved aesthetically significant harmonic backgrounds and colorings of interval and chord masses.

The following condensed treatment of the three subjects, harmony, counterpoint, and rhythm, is an effort to explain the general nature and essential elements, and at the same time outline the general drift of their historic development.

Harmony.—Harmony, broadly conceived, covers all synchronous and progressive or melodic tonal relations. In a restricted use

it means the structure and relation of chords and intervals.

The history of harmony is the history of the development of music, inasmuch as all forms of music are based on harmony in its broad and essential meaning. Archaeological research has brought to light many facts concerning ancient instruments which give wing to the imagination, and induce the belief that harmony, in its narrow meaning of synchronous intervals, was known and practiced before recorded history recognizes it. This belief finds corroboration in ethnological researches, which make clear the fact that all stages of human development are represented by human beings to-day, and that the most primitive of these peoples not only sing in parts, but in some instances order their music in accordance with modern tonic tonality.

The highest expression of the conception of harmony as the simultaneous sounding of tones, however, could not be attained until its deeper and broader significance was discovered and wrought out in a conscious application of the tonic principle of tonality. Many of the most ancient folk melodies, untouched by theoretical or ecclesiastical thought, reveal this principle as at least subconsciously operative in the human mind. A large mass of melodic material makes it certain that this principle was the essential force in the structure of the folk music that arose from the effort to give expression to the individual and social spirit, long before and throughout the periods when the theoretical musicians were blindly searching for a free and unlimited means for musical expression of the human spirit.

From whatever source the Greeks may have derived their conception of harmony (*harmonike*), historically they furnished the primary harmonic system upon which rested the first period of music as a consciously developed art. Through the Christian Church the modern world inherited the diatonic tonality of the Greek system, with its various species. To this were added, at a later period, chromatic intervals as embellishments, but not as integral units of a definite chromatic tonality, as in the Greek system. With the exception of many of the genuine folk songs and dance tunes, and the dawning musical drama of the latter part of the sixteenth century, this harmonic system of tones or modes furnished sufficient material for the larger part of the monodic and contrapuntal music, secular and sacred, vocal and instrumental, of the first Christian period, including the marvelously complex and beautiful works of Orlando Lasso and Palestrina. Such a system, however, was not comprehensive enough to furnish the human spirit with adequate material to meet the demands of its awakened and expanding aspirations for higher forms of musical expression. Still further, dependent upon language for its coherency, this tonal system

did not possess an inherent principle capable of crystallizing into a well organized and independent art the tonal material and relationships revealed and suggested by the contrapuntal polyphony of the period.

During the latter part of the sixteenth century the tonic principle, which had been embodied in many of the genuine folk songs and dance tunes of the modal period, and which had sporadically come to light in contrapuntal music, finally broke the shackles of the mathematical determination of intervals, received definite recognition, and assumed its rightful dominion in the ordering of harmony and melody. This tonic principle gradually developed a definite and primary harmonic tonality, the *diatonic*, involving the three primary harmonies of *tonic*, *dominant*, and *subdominant*, together with a corresponding system of harmonic units, called *chords*. Here, too, the term "harmony" covers two distinct meanings: the progressive conception involved in tonality, and the static conception embodied in the chord, and in the interval formed by two synchronous tones. The system of pitches necessary to the expression of tonality was called, as in the Grecian and ecclesiastical tonalities, a *key*, each key system being named by the root pitch of the tonic chord. Two distinct species of diatonic tonality, called major and minor modes, gradually crystallized, adding new and extremely effective harmonic material.

An embryonic conception of chromatic tonality arose from experiments in modulation to nearly related keys. Owing, however, to the pure tuning of the instrument used in the period preceding Bach, the number of key tones available for modulation was limited almost exclusively to those of the dominant and subdominant, with their so-called relative minors based upon the sixth tone of each major key. With the final establishment of the equally tempered scale of keyed instruments, the way was open for the application of the tonic principle to the complete development of a harmonic unity of diatonic keys in a definite tonality, the *chromatic*, with its system of chromatic keys, chords, and cadences. This larger horizon stimulated and greatly enriched harmonic imagination, since chromatic intervals no longer served as mere melodic embellishments, but became harmonic units of chromatic tonality, and their expressive significance and capacity were therefore enormously enhanced. As a result, chromatic melody assumed a new and highly significant rôle in the development of all types of music, but especially of the dramatic.

Diatonic and chromatic tonality furnished, almost exclusively, the harmonic and melodic material for the monophonic and contrapuntal music of the sixteenth to the first half of the nineteenth century, including the greater number of the works of Bach, Handel, Haydn,

Mozart, and the early part of the Beethoven period. Rich as this mine of harmonic and melodic material proved to be, it did not measure up to the demands of the restless spirit of the latter part of the nineteenth century. In this period of storm and stress and feverish search for more efficient means of musical expression the tonic principle proved equal to all demands, and opened a new vein of unlimited harmonic and melodic wealth in an all-inclusive tonality, for which the term *enharmonic* is a legitimate cognomen. The enharmonic tonality is the all-inclusive harmonic unity of all diatonic and chromatic keys.

In the polyphonic exploiting of tonality, one of the most significant means of expression, vitally characteristic of contrapuntal as distinct from chordal polyphony, is the harmonically individual significance of each melody. In pure counterpoint the application of this principle of harmonic individuality in respect to each melody produces the impression of the compounding of harmonies. In diatonic, or even chromatic tonality, this harmonic individuality concerns itself only with the simultaneous defining of different harmonies, or chords, of the same or related keys; but in the enharmonic tonality two or more melodies may simultaneously move in two or more diatonic or chromatic keys. The revelation of this inexhaustible source of harmonic and melodic material opened an infinite field for monodic invention, and revealed an entirely new basis for contrapuntal imagination. Composers have not been slow in exploring this mine, and their labors have issued in many masterpieces of musical art born of the noblest and purest spiritual aspirations and inspirations, and also in some voluptuously sensual aural orgies that rival the wildest dreams of Bacchanalian revels and debaucheries. And the end is not yet.

The history of harmony, in its broad and legitimate sense, shows clearly that the development of the consciousness of tonality is the direct result of the ever-increasing demands for significant melody. In the Grecian and early Christian periods, the units of thought were intervals conceived, in a sense, horizontally. Musical thought was concerned with only one dimension. Expressive power was gained by means of the character, the color, of the intervals, and relatively few were, or could be, made use of, even if the quarter tones be included. This monodic mode of expression sufficed, since, in the main, music had no real independent existence, and melody was essentially speech inflection tonally defined. Cohesion of melodic material really centered in language, and the æsthetic character of the poetry. The result of the efforts at polyphonic expression immediately established a harmonic conception of the interval in two dimensions—longitudinal (melodic) and vertical (synchronistic)—moving simultaneously.

Through this process coherency began to appear as a definite and purely musical fact, music began to break away from the limitations imposed by language and to assume an individual existence and character. As a result the development of instrumental or pure music became possible.

Pushed to its logical conclusion, the synchronous conception of intervals revealed the fact that the chord is not a mere aggregation of such intervals, but is a definite harmonic entity formed, primarily, of a *root*, or center of unity (thus representing, like the prime pitch of the individual tone, the tonic principle); a *fifth*, or root-defining interval, and a *third*, or mode-defining interval. The recognition of this pure chord unit and its progressive orderings necessarily led to the consciousness of a third dimension embodied in pure harmonic tonality. Thus melody enlarged its expressive scope by a threefold harmonic significance, and attained to a principle of cohesion that finally wrought out the absolute individuality of music as an art having its own significant power of expression, and no longer dependent upon either the dance or poetry to define its solidarity, or to make clear its message.

Since in all times the roots of art draw their sustenance from the eternal mental and spiritual needs of humanity, history is ever repeating itself in art, as in all other modes of thought. This repetition is never a copy, however; but is manifested in new forms, under varying conditions, meeting the present conceptions of mental and spiritual nature and aspirations. This is seen in the history of music. Notwithstanding the enormous amount of harmonic and melodic material included in diatonic, chromatic, and enharmonic tonalities, in keeping with the ultra-impressionistic spirit of all modern art, musicians are not wanting who find no satisfaction in the material at hand. Even the alleged whole tone scales and melodic phrases are beginning to pale, and the quarter tone as an element of harmonic and melodic coloring and significance is being revived and experimentally exploited by a few radical musicians. The demand by the few for more significant means of expression is no proof, however, that the present melodic and harmonic material is inadequate. It may possibly be a sign of failure to perceive the potentialities of present means, or a witness to the absence of the "open vision," of the power to see through the veil of sensuous tone and discover and mold significant melody, rhythm, and harmony into pure and noble embodiments of the real spirit of music. Time alone can determine whether the employment of the new-old material shall issue in rarer and more beautiful "temples never built at all, and therefore built forever"; but history would seem to prophesy failure, and for the same inherent reasons that obtained in Grecian efforts based upon like means.

Harmonic Terms. — *Tonality.* — In general, any specific system of intervals, or chords, or harmonies constituting the unit basis of melody. In modern music, a specific harmonic unit based upon a real tonic principle. Tonality is essentially fluidic in nature, involving, like the line, progress of thought; whereas, the tone or the chord is static in its primary character. Tonality is of three orders: —

(a) *Diatonic*, — the harmonic unity involving the primary harmonies of *tonic* (I), *dominant* (V), and *subdominant* (IV), in both major and minor modes, and their derivatives, *super-tonic* (II), *submediant* (VI), *mediant* (III) of the major mode, and *diminished* and *flat super-tonic* (II), *flat submediant* (VI), *flat mediant* (III), and *flat subtonic* (VII) of the minor mode.

The following diagram of the diatonic tonality of C makes the chordal and harmonic content clear. A line under a figure or letter indicates a flat (*d* = *d*-flat, *II* = *II*-flat); and over a figure or letter, a sharp (*c* = *c*-sharp, *IV* = *IV*-sharp).

(b) *Chromatic*, — the harmonic unity of the diatonic keys of *tonic*, *dominant*, *subdominant*, *mediant*, *super-tonic*, and *submediant* tones of the major mode, and *tonic*, *dominant*, *subdominant*, *flat super-tonic*, *flat mediant*, *flat submediant*, and *flat subtonic* tones of the minor modes.

(c) *Enharmonic*, — the all-inclusive unity of all diatonic and chromatic tonalities.

Chord. — Harmonic unity of three factors, root (1), color (3), and definer of root (5).

Chords are (a) *simple* — major and minor triads; (b) *complex* — (i) augmented and diminished triads, *c e g̃ c*, *e g̃ c*, *e g̃ c*; (ii) all septachords and (iii) nonachords; (c) *compound* — all chord forms having two well-defined roots, although one may harmonically predominate, as in the major diminished septachord, *e g a c̃*, or nonachord, *e g a c̃ b̃*, where *e* and *a* are roots whose center of progression is the chord of *d*.

The superimposing of chords results in (1) *compound harmonies*, (2) retardation of harmonic progression, or (3) the simultaneous progression of two different harmonic series.

Interval. — The harmonic unity of any two tones: the relation, synchronous or progressive, of any two tones. Intervals are classified (1) according to (a) the number of contiguous degrees involved — *primes*, *seconds*, *thirds*, *sixths*, etc.; (b) the character of the interval — *perfect*, *major*, *minor*, *augmented*, *diminished*. (2) As (a) consonant — *perfect fifths*, and *octaves*,

and *major* and *minor thirds* and *sixths*; (b) dissonant — *seconds, fourths, ninths*, and all augmented and diminished intervals.

Key. — The system of tones involved in tonality, — diatonic, chromatic, or enharmonic. The key is named by the root tone of the tonic chord — key of *D major, D minor*, etc.

Scale. — The degree-wise ordering of the tones, diatonic or chromatic, of a key from any given point, usually the key tone, up or down to the octave.

Diatonic tonality includes sixteen, and chromatic tonality a very much larger number of possible diatonic scales.

The chromatic scale consists of the following incidents — 1 1̣ 2̣ 3̣ 4̣ 5̣ 6̣ 7̣ 7̣, in the major mode; and of 1̣ 2̣ 3̣ 3̣ 4̣ 4̣ 5̣ 6̣ 6̣ 7̣ 7̣, in the minor modes.

Counterpoint. — The term "counterpoint" (*contrapunctus*) had its origin in an early system of representing melodic movements by means of points, and therefore literally signifies point against point (*punctus contra punctum*). In general, counterpoint is a species of musical writing resulting from the weaving together of two or more individually significant melodies into a harmonic unit having definite design and form. *Polyphonic* (many-voiced) singing is known to exist among the most primitive peoples of the present age, such as the Bushmen of Australia. This fact furnishes some basis for believing that part singing may have been practiced long before written history takes note of it, but there are no records of a conscious effort to develop polyphonic art until about the eighth or ninth century of the Christian era. The development of a higher and more complex inner life, together with an expanding apprehension of the solidarity of humanity, could not find adequate art representation in the pure monody of Greece or in the early Christian period, notwithstanding all the subtle and complex modes of enhancing its æsthetic and spiritual significance. The demand for a more deeply expressive, more comprehensive, more fully organized form of an art that touches so strongly the hidden secrets of the human mind and heart led to the development of *polyphonic* and *polyodic* music.

The earliest attempts at polyphony resulted in one or more voices singing a more or less exact repetition of a given melody, called the *cantus*, a fourth below or fifth above, with cadences on the unison or octave. The essential progress of the accompanying voices being parallel to the *cantus*, no real melodic individuality could result. This seemingly barren type of counterpoint was not, however, without a certain æsthetic significance quite in keeping with the austere and icy character of monastic and religious life. Melodic individuality and significance in the accompanying voices became possible when the principle of contrary motion in respect to the *cantus* began to govern the progression of the accompanying

melodies. The resulting synchronistic intervals were the fifth and octave. This type of polyphonic music was called *descant* (*discantus*). The ungainly skipping nature and utter insipidity of the melodic succession of intervals resulting from this mode of *descant* led to the improvised or artistically designed filling in of certain skips according to laws governing both melodic progression and rhythmic proportions, and the point for point (*cantus planus*) type of counterpoint was supplanted by the more interesting and artistic species of figured counterpoint.

The development of this species of writing finally broke through the restrictions imposed by a false mathematical determination of intervals, and established the intervals of the third and sixth as effective musical material, whether in the form of melodic progression or quasi chord masses. Thought and imagination thus liberated wrought out a higher degree of melodic and rhythmic individuality and significance in both the *canti* and the accompanying voices, and a pure contrapuntal polyphony was the final outcome. The advent of this free and pure contrapuntal type of music marked the beginning of the choral epoch, one of the most prolific and glorious periods in the history of music: an epoch which included the works of Palestrina and Bach. Notwithstanding the enormous increase in the power and broader scope of musical imagination and æsthetic expression resulting from the use of the richer intervallic coloring and rhythmic life in the ordering of melodies, a purely musical cohesion did not exist. The necessity for it, however, did exist in the very nature of human thought, and the next epoch registers the appearance and application of the primary principles of musical coherence and unity, and a more highly organized and expressive type of form.

The first principle to appear was imitation. Somewhere some one hit upon the device of making portions, or the whole, of the principal melody accompany itself. In one method of writing the second voice begins the original melody when the first voice reaches a certain point in the *cantus*. This distinct species of contrapuntal polyphony is called the *canon*. The well-known Round, *Scotland's Burning*, is an illustration. Canons are termed *strict*, if the answering voice repeats each interval exactly as in the *cantus*, or *free*, if it varies in any degree the nature of the answering intervals. Canons are also designated as *canon at the unison, octave, second*, etc., according as the answering voice begins at the interval of the unison, octave, or second from the first tone of the *cantus*.

The following types of complex canon were eventually evolved: (1) *Canon by inversion* — the second voice answering the upward progressions in the *cantus* by downward movements, and vice versa. (2) The *crab canon* —

the second voice singing the cantus backwards. (3) *Canon by augmentation* — the second voice singing the melody in notes double the length of the cantus. (4) *Canon by diminution* — the second voice repeating the cantus in notes of half the value. Repetition rather than true imitation is the essential characteristic of this type of polyphony, but in the *free canon* the element of variation approaches more nearly the spirit of the higher type of imitation.

Through the increasing influence of the folk song, the folk dance, and the musical drama, and the adoption of the tonic tonality, with its major and minor modes, the fundamental principles of form were evolved, and instrumental or pure music attained its freedom. From this period, polyphonic thought in both vocal and pure music developed in the direction, (1) of the pure contrapuntal type, (2) of the chordal or harmonic type. Apart from dramatic music and the pure song, the dominating idiom of musical thought in this contrapuntal and choral epoch was the fugue and fugal and canonic imitation. This species of musical art was the product of the canonic type plus a demand for greater unity through well-defined tonality and logically organized form. It used the principle of the cantus, but in the form of a short theme. It employed the repetitional method of imitation, but developed a high species of *variation* in the imitating voices. It molded its forms along lines derived from the folk song and the folk dance, but with a freedom that made possible the embodiment of the noblest lyrical and even dramatic imagination.

The elements of the fugue are (1) the *theme (dux)*; (2) the answer (*comes*) — the repetition of the theme by the second voice in the dominant key (later in other keys), either strictly, called the *real fugue*, or in a modified form, called the *tonal fugue*; (3) the *counter subject* — the contrapuntal melody sung by the first voice as an accompaniment to the *answer*; (4) the *episode* — a free treatment, in fugal and canonic imitation of various types, of some figure or phrase of the theme, binding together the several parts and serving as contrasts to the sections in which strict imitations of the theme obtain; (5) the *stretto* (pressing together), in which the imitative repetitions of the second voice begin before the complete ending, and at points nearer and nearer to the beginning of the theme.

The era of the fugue and canon culminated in the works of the acknowledged greatest musical genius the world has yet known, Johann Sebastian Bach.

Overlapping, but essentially beginning with the establishment of the tonic principle and the domination of the chord mass in place of the simple interval as the essential unit of thought in tonality, pure counterpoint has been ordered in accordance with the two dis-

tinct governing principles of (1) *tonality*, whether *modal* (ecclesiastical) or *tonic* (modern tonality), and (2) the *chord*. In the first and purest type of counterpoint each melody moves freely in the tonality, untrammelled by any necessity for defining, in conjunction with the other voices, a specific series of chords, and unfettered by any demand that its cadences shall coincide with those of accompanying voices, except at the close of important sections. In this species the synchronous masses are not chordal in the strict harmonic sense; but masses of synchronous intervals, intervallic colors, suggesting, it may be, two or more harmonies or chords. In the second type of counterpoint all the voices, while real and individual melodies, move with reference to defining a specific chordal scheme. In this second type the synchronous masses are clearly defined chord units, either simple or complex. These two types of polyphonic music are distinguished by the fact that all the voices are concerned with melodies of equal significance, and are, therefore, strictly contrapuntal.

A third and important species of polyphonic music is one in which the voices are concerned mainly, if not solely, with the function of defining chord masses and enriching them with intervallic color, sonority, and massiveness. Chord masses thus conceived may serve as the principal means of expression; and melody, in a degree, may be fragmentary and not definitely organized, or all chords may be used as means for enhancing the expressive significance of one or more important melodies. This is the genius of what is termed the monodic or monophonic type of composition, although it may be polyphonic as to the fact of many voices. In this type of polyphony the voice progressions do not pretend to assume melodic significance, as in pure counterpoint; in fact, the various voices may be, and often are, without melodic significance. These three types of polyphonic thought are all employed as means for enhancing the æsthetic import of the music of all writers, from the pure lyrical and dramatic contrapuntist, Johann Sebastian Bach, down to Richard Strauss and Claude Debussy, the ultra-impressionist tone painters of the present time.

Rhythm. — In all modes of thought, all modes of imaging a consciousness of ideas or experiences, the factors of duration, or quantity, and intensity, or stress, are necessary conditions for determining æsthetic form and significance. Proportion in respect to duration, or dynamic intensity, arising from the æsthetic impressions or from the nature of the elements of expression, — for instance, sound in language, tone in music, — is the essence of that idea which, following the Greeks, we call Rhythm. A rhythmic idea appears whenever a grouping or ordered sequence of proportions is defined.

In music the melody of folk songs and church canti followed the proportionate durations gov-

erning the sounds of language until the efforts at combining melodies of varying rhythmic design made it necessary to adopt some principle of order and unity in respect to the number of tonal durations that should be sung to the tones of the cantus by the discanting voices. From these efforts arose what was called *metrical music*, based upon two primary ratios—the perfect, three is to one, $\text{ddd} = \text{o}$ and the imperfect, two is to one $\text{dd} = \text{o}$.

Under the influence of counterpoint, the dance and instrumental music, the gradual development and organization of complicated rhythms led to the adoption of the accentual principle of metric rhythm as a means for defining the progress of the various voices. The elements of metric rhythm are (1) units of a given duration, called beats; and (2) varying intensities in respect to the thought content of such units. A measure, therefore, is a rhythmic entity involving the relation of a definite number of beats of like duration, but of differing intensities. Measures may vary (1) in the number of intensities or beats, i.e. two, three, four, beat measure, etc.; (2) in the order of the intensities, as in the following illustrations, where the quarter note represents a beat of given duration, and the bar the point of greatest intensity.

To meet the exigencies of free poetic imagination and to avoid monotony resulting from a long series of like kinds or orders of measure, there are in music varying modes of treating metric conceptions.

1. The most common metric variation results from the use in a given metric series of a variety of forms (orders of intensities of measure); that is, while the general unit of duration from crest to crest of the greater intensities remains comparatively constant, the less significant thought units, the lesser intensities, may freely vary in their relations to the strong intensity, thus resulting in a series of changing forms of measure.

2. A second mode of variation (Fig. 1) arises from the sudden changing of the strong intensity from its normal position in the series, resulting in what is known as *syncopation*. In polyphonic music, syncopation practically arises

Fig. 1.

from superimposing like meters, starting at different periods, a species of rhythmic dissonance. A modern term for the extreme use of this effect is Ragtime, to which all great writers must plead guilty.

3. A third and very effective mode of rhythmic treatment arises from combining different measures. That is, while one melody moves in, say, three-beat measure, the second may be moving in two-beat, and a third in four-beat measure, a species of rhythmic harmony. In the following illustration (Fig. 2) from Schumann the melody is in three-beat and the accompaniment in two-beat measure.

Fig. 2

(4) The fourth form of metric variation is the product of a series of varying kinds of measures. This species of rhythmic variation may be accomplished in different ways:

(a) The measure may change in respect to the number of beats without changing the limit of duration between the points of greater intensity, as in the following passage from Schumann (Fig. 3), where *a*, the primary two-beat measure

Fig. 3.

of the first strain, is followed by *b*, a three-beat measure, the metric scheme of the second strain; (*b*) A beat may be added or subtracted, thus changing not merely the *kind* but the real duration of the measure, as in the passage from MacDowell on the following page. (Fig. 4.)

This rhythmic variation is characteristic of many folk songs, showing that it is a primitive form. The following fifteenth-century chanson is a fine specimen. (Fig. 5.)

(c) A third variant, of like nature with the above, is a species of rhythmic augmentation, as in the following passage from Schumann (Fig. 6), where the rhythmic unit *a*, formed by two three-beat measures, is followed by really a

MUSIC AND MUSICAL TERMS

Fig. 5.

one-measure rhythm of three augmented beats, three longs, the quantitative value of which equals the preceding two-measure unit.

Fig. 6.

The following complicated and effective passage from Brahms's Clarinet Sonata in E minor is interesting, because of the augmentation in two voices that are syncopated in respect to each other. (Fig. 7.)

Fig. 7.

In the educational development of rhythm, meter is usually given the first place, as though it were the more important rhythmic factor; quite opposed to this common theoretical notion, however, is the fact that in the real interpretation of both music and poetry meter is far from being the most significant rhythmic conception. Based upon the circumscribed figures of the dance, and serving the purpose mainly of punctuating the lesser units of thought, in the highest lyrical, and especially in dramatic music, the metrical accent is practically lost, swallowed up in the quantitative proportions and the stresses involved in the larger units of musical thought, such as the phrase, and even the motive. As a matter of fact, therefore, quantity (durative mass) and quantitative proportions are the essential elements of rhythmic thought. A very simple illustration will serve to make clear the vitally expressive rhythmic effect of the rhythm of quantity. The following versions of the opening phrase of Beethoven's Sonata, *Opus 13*, do not differ in respect to the number of beats and points of greater intensity. (Fig. 8.)

MUSIC AND MUSICAL TERMS

Fig. 8.

Nominally, and as conventionally printed (fig. 4) this phrase is supposed to lie within one measure of four beats, each beat being represented by a quarter note. Practically, the development of the thought requires two points of greater intensity — the first and fifth tones. The beat, therefore, is represented by the eighth note, and the phrase includes two four-beat measures.

Fig. 4.

In the first version, Beethoven's dramatic idea is entirely lost, because the individuality of the first chord is merged with the second and third chords, forming the opening musical idea. In version two the rhythmic form of the first chord embodies a distinct impression, like, for instance, the first word in *Hence! loathed Melancholy!* But the intensely dramatic force of the opening chord is only realized in the quantitative form of Beethoven's version. Still further, in Beethoven's version the second idea, *b*, is far and away more dramatically expressive by reason of the quantitative proportions, and also because the same means break the thought into two impassioned utterances, *b*¹ and *b*², the second of which forms the climax.

Educationally, it would seem to follow, as a necessary deduction from historical evolution and the greater significance of quantitative (durative) proportion, that this should be the rhythmic principle first recognized and most assiduously studied. The ordinary method of metric scansion in music based upon the tyranny of mechanical accent (in music represented by the bar) is deadening to the higher and vital conception of the beauty and expressive significance of quantity in music as certainly as in poetry.

It remains to call attention to the fact that rhythm plays as significant a rôle in the harmonic design as it does in the melodic structure. For the understanding and interpretation of a musical work of art it is essential, therefore, that the rhythm of the harmonic background

should receive equal consideration with the rhythm of the melodic designs. C. B. C.

MUSIC IN EDUCATION. — Historical

Sketch.—The place of music in popular education has changed with the changing motives that control such education. Three distinct phases may be recognized: the religious, when education was chiefly connected with the Church and the teacher was the priest; the humanitarian, which came with the growth of the democratic influences of the eighteenth century; and the social-economic, as one may call the third phase upon which we are now entering. The rapidly growing complexity of our modern life has been putting greater and greater demands on our whole educational system. The problem of the modern educator is to discover how to economize time and energy. A new valuation is now going on of all forms of study and exercises that occupy the student's time, aiming to adapt the curriculum to meet the practical requirements of life efficiently. It is natural that such a study as music, which presents so little that can be measured from a practical point of view, should be influenced by this movement.

The Religious Phase: Choir Schools.—Tradition says that choir schools (*schola cantorum*) were instituted at Rome as early as the fourth century (by Pope Silvester I, 314-335) and from 590 they were much emphasized by Gregory I (*q.v.*). At least by the eighth century, if not much earlier, the Western Church had given official sanction to a system of unison melody, commonly known as "Gregorian," though apparently developed from Byzantine and Greek origins, which had attained notable proportions as the artistic vehicle or embodiment of the liturgy. That the Church used music as a means of elevating the people is shown by a saying of Chrodegang of Metz (746-766): "The melodies of the singers shall uplift the people to love of divine things through the inspiration of the words as much as through the tune." From about the twelfth century the Church also became the field within which the art of contrapuntal composition unfolded. This evolution was scholastic, rather than popular. To master it required discipline, such as was possible only under teachers and through study. In the medieval "choir school" the subject of the new Figured Song was now added to that of the Gregorian Plain-Song. The persons thus educated were primarily only adult ecclesiastics,—monks and priests,—but as choirs of men and boys became common, the "choir school" tended to become an institution in which many boys below the age of puberty might be educated to considerable musical proficiency. The study of sacred song was the main object, but, because the boys had to be kept together for several years, other subjects were introduced more or less. Hence the "choir school" often touched the field of general education, but with music highly emphasized. In process of time some of these schools accumu-

lated endowments and became independent institutions. A famous illustration of this is the Thomasschule at Leipzig, which began as an Augustinian monastery school in the thirteenth century, and became a Protestant town school before the middle of the sixteenth. Many others, especially those connected with cathedrals and with certain national courts (*Chapel Royal*), have persisted in some form to the present day. (See *CHORISTERS' SCHOOLS*; *SONG SCHOOLS*, in the article on *MIDDLE AGES, EDUCATION IN THE*)

Early Methods of Teaching Music. — From the earliest periods two distinct modes of approaching music teaching were presented, one in which the learning was through imitation, teaching by rote, as it is called — and the other where the rudiments of music were taught, and the pupils learned to read from the written signs. In a school ordinance of 1522 at Nördlingen the pupils were to be divided into three sections, of which the two upper ones were to receive instruction in theory and practice, and the last should first be taught the text, and then the tune by ear. The Württemberg church ordinance, 1559, and the Pomeranian, 1563, provided for the practice of singing in elementary schools, but the method was only that of singing by ear; in the Latin schools it was usual to employ the pupils in choirs so that they received regular instruction in music. While the Reformation broke away from the older ecclesiastical music, it stimulated in the chorale even a greater desire to sing. Luther is reported to have said: "A schoolmaster must be able to sing or I take no notice of him" The ordinances drawn up by Melancthon and Bugenhagen provide for instruction in music, but they deal generally with Latin schools. The School and Church Visitation in Marburg (1628) and Hesse-Darmstadt provided that all children above eight years of age should "attend the public schools and at all times be present at the singing in Church." Duke Ernest the Pious of Gotha (q.v.) included singing in the famous *School-method* of 1643, which devoted one of the longest portions of the work to the subject (paragraphs 212-294). It includes suggestions on method and formal instruction in music. At least one hour each day was to be given to it. Two divisions, choral music and figured descant (*Figuralgesang*), were made. The former was taught by ear, phrase by phrase; the latter from notation. The teacher is warned not to weary the pupil with too much theory and troublesome scales. A song book is to be provided for each. Clear and sensible expression should be insisted upon. The earliest pieces were to be sung in four parts (descant, alto, tenor, and bass). The teacher was not provided with an instrument for accompaniment. An ordinance of 1697 for Nuremberg provided that singing should be taught in writing and ciphering schools for church purposes. Co-

menius (q.v.) proposed that the child should be taught singing of a few easy psalms as early as the "mother school." In the elementary school he only recognizes singing for church and religious purposes. Francke's aims in music were similar.

The numerous ordinances of the sixteenth century provide for the teaching of singing, but in all cases the subject matter is religious. In many cases the ordinances appoint the local sexton to teach singing along with the catechism. In fact, many Protestant schools owe their origin to the need of teaching singing for the service of the Church.

In England the song school occupied a position a little above the elementary and below the grammar; and while their chief object was to teach the singing necessary for church services, the other common subjects were included.

Erasmus describes the English as a musical and the German as a drunken people, and it has been suggested that the abolition of the training school of song and music that took place with the Reformation and during the reigns of Henry VIII and Edward VI had much to do with changing the musical character of the English people.

It must be noted that the song school was not confined to song; often teaching to play on the organ is included in the description of the song school master. Such was the case at Bosbury in Herefordshire. The schoolmaster was to "bring up the youth in learning and to play the organ." Similar to the song schools in England were the sang schools of Scotland; one in Aberdeen is believed to have existed as early as 1370. While in Scotland especially the sang school seems to have been adopted by the Reformation, the lesser importance that music occupied in the service of the Protestant Church reduced the importance of these schools, so that they have gradually died out.

Gild Schools. — Outside the Church town organizations, the gild schools and the "town musicians," contributed largely to the development of musical education. Of the gilds the most notable example is the extensive circle of gilds organized by the *Meistersänger* of southern and western Germany from the fourteenth century onward for more than two hundred years. These societies sought to magnify poetry and song as a kind of trade specialty, which was to be cultivated only by passing through a graded system of training and examination that led ultimately to the right to the title "Master." The historic importance of these curious fraternities lay not in the artificial and even ridiculous methods that they often used, but in their number and distribution, with the considerable number of their members. Artistically and pedagogically, the *Meistersänger* movement lacked breadth and insight; but its popular influence was not

insignificant. It served to bring into action latent capacities for music as a serious pursuit among the common people, and to dignify the process of education which was involved in that pursuit. Somewhat parallel movements—the so-called “Minstrel Gilds”—occurred in other countries.

Town Musicians.—Associated with these gilds in time, though not always connected with them directly, were numerous efforts to organize in certain communities a body of “town musicians,” both singers and players upon instruments, which could be called upon to assist in numerous civic and social functions. Every such organization, when continued long enough to become an institution, demanded more or less of an educational element or basis, which was variously supplied in different cases, sometimes through the town schools. It is difficult to cite any large number of facts under this head, but there is reason to suppose that from the sixteenth century onward a constantly increasing number of towns and villages in Germany, France, and England maintained some communal interest in music, and made some slight communal provision for instruction in it. This tended always to bring the subject of music into organic connection with whatever system of public education was attempted.

The Humanitarian Phase.—The second phase of music teaching was strongly influenced by the humanitarian spirit that so pervaded the democratic movement in the latter part of the eighteenth century. The school, instead of being for the Church, was developing more and more for the people. Hence, reforms in the methods of teaching were many and radical. The desire to give every one attending school the rudiments of a musical education led to the simplifying of notation. Much of the interest that was awakened in popular singing early in the nineteenth century can be traced, in Germany especially, to the revival of interest in liturgies in the Lutheran Church, giving importance to congregational singing. Another motive is that the national school systems that were then being started in the leading countries of Europe gave a value to music as an element in the education of patriotism. The influence of such a reformer as Pestalozzi was felt. Hans Georg Nageli (*d.* 1836), a music publisher near Zürich, was active in agitating for school music, especially advocating the application of the new methods of Pestalozzi to the subject.

In France, Guillaume Louis Wilhelm (Bocquillon, *d.* 1842), known chiefly by his efforts to promote popular teaching of singing, was made director-general of music in the municipal schools of Paris in 1819. He threw himself into this cause with an enthusiasm which soon produced striking results. Besides the school teaching, he had classes which gave instruction to thousands of pupils, mainly working people; and out of this presently grew the establishment of the *Orphéon*, the vast organization

which has since covered France with singing societies.

The success of Wilhelm's work in France stimulated similar movements in England under Mr. Hullah, who on Feb. 1, 1841, opened at Exeter Hall a school for instruction of school-masters of day and Sunday schools, in vocal music, by a system based on Wilhelm's. In twenty years, it is said, over 25,000 persons passed through his classes.

Tonic Sol-fa Method.—A parallel movement in popularizing music in England, which grew to much greater importance, under the lead of Mr. John Curwen, began to attract attention about 1850. It is based on a simplification of musical notation, the staff being discarded and a letter notation being substituted in its place, indicating the relation of the tones in the key. The emphasis of key relationship of the three most important tones in our harmonic system gave the name to the method of Tonic Sol-fa.

Galin-Chevé Method.—A similar method was being developed in France, although not attaining the same importance, under the name of the Galin-Chevé, in which, as in the Tonic Sol-fa, the relationship of the tones in the key was emphasized, only in this case numbers were placed over the notes to indicate this relationship.

Public Class Instruction.—Still more important pedagogically was the change in methods that ensued from passing from the traditional custom of private or individual instruction, which had been in use for generations in most musical subjects, to systematic class instruction, particularly of singing in chorus. This is seen in the widespread interest in choral societies of different sorts that began to attain large proportions during the first half of the nineteenth century in Germany, France, and England. Such enterprises, whether in schools or in communities, stimulated the preparation of special literature, — textbooks for learners, manuals for teachers, graded material for the use of societies, — and tended increasingly to induce many persons to prepare themselves to become instructors, trainers, and leaders. Thus public school music and public choral societies so closely connected in the methods employed gradually became distinct and significant movements.

United States.—The enthusiasm for the popular teaching of music, which was being felt so strongly on the Continent and in England, was not lacking in the United States. Under the lead of Lowell Mason (*q.v.*), who is well called the father of school music in America, work was commenced in Boston that led eventually to the adoption in 1837 of a resolution: “That in the opinion of the school committee it is expedient to try the experiment of introducing vocal music, by public authority, as part of the system of public instruction, into the public schools of this city.” Parallel to

the school work, like both Wilhelm and Hullah, Mr. Mason started an institution for giving concerts and preparing teachers, known as the Boston Academy of Music, established in 1832. Mr. Mason was strongly influenced by the teaching of Pestalozzi, and avowedly conducted his work on his system of teaching. The example of Boston was soon followed by such cities as Cincinnati and New Orleans, and there has been a steady advance toward the full recognition of music as a school study.

The Social-Economic Phase.—The trend of the third phase in modern popular education, which we have termed "the social-economic," is well illustrated by the tendency to slight or drop music entirely in schools fitting students for the higher institutions of learning.

A glance at the courses of study offered by such institutions in Germany, France, England, or the United States will show that less time is given to music than formerly. Higher education tends to become more specialized, and a subject like music, which shows perhaps less connection with a professional occupation than does any other, now takes a less important position than in schools serving a similar class of people fifty years ago, when the cultural or general education was stronger than the professional or economic.

A second reason influencing the change is the very great development of popular education, making a demand for teachers from the middle and lower classes who necessarily are unable to put very much time on professional training; so that, especially in America, a large proportion of the grade teachers are musically unable to teach the subject. The preparation of these teachers, demanding so much in the line of modern practical subjects like physical training, manual training, drawing, domestic science, and domestic art, tends to leave less and less time to the preparation for teaching music. Along with this same pressure the experiment of attempting to teach everybody sight reading, that was so enthusiastically supported in the middle of the last century, is not giving the expected results. Not only is the necessary drill proving irksome both to teachers and pupils, but the slight mastery gained is not proving of any great musical value in the later experience of the pupil. Hence, the liberal educators are dividing the time given to specific music study with what might be called "appreciation work," the hearing of music performed, since the modern mechanical means for reproducing music prove a very great aid to such work. There is also a distinct tendency to encourage instrumental work in schools, although this is often supplementary to the regular school work. Especially striking is the work done in England by what is known as the "Maidstone Movement," where fully half a million school children of the British Isles are connected with an organization for playing the violin. There

is a tendency in the extremely modern schools to shift the emphasis in music from the pure sight reading work of the earlier years to various forms of what might be called creative work. Under the theory that the pupils get the most out of what they make themselves, they are encouraged to make up not only their words but the tunes as well. Finally, while the place of music and the method of its study are changing, and the place it has occupied is being contested by other subjects, yet this very struggle is bringing about a larger view as to its true value in education, and more efficient methods as to its realization.

Methods in School Music.—Methods in music teaching deal with two kinds of activities: (1) What is necessary for producing the music, such as the control of the instrument, or voice, and the understanding of the notation. (2) What is done under the term of "nuance," popularly called "expression," and the slight notation that indicates it. The first may be said to deal with the structure of music, the second with its interpretation. It is obvious that the first application of a method in music will be to produce tones, following which there will be a constant effort toward control for expression. This is especially true for the instrumentalist. Even the voice teacher spends the first few years in what is called "voice-placing," practice for producing a good singing tone, before he does much with song interpretation.

In teaching school music, however, this order of activities is reversed. The voice in most children, through the exercise of speech, is already under wonderful control, so the aim of school music is not to produce professional singers with developed voices, or professional players, but to cultivate a taste for music by good singing and to prepare the individual to aid in the social uses of music, and it is better to commence with rote songs, or singing by imitation. Two things are thus of special importance in school music: (1) the pupil must know how to render many fine songs in order to develop his taste and appreciation; and (2) he must be able to read from notation.

The instrumentalist, by the time he has learned to play, has associated the action necessary to produce the tones with the notes on the staff that represent these tones, so that when he sees the note he can produce the tone. He can thus, unfortunately, especially if he is unmusical, avoid the necessity of thinking music. The mental process of such a person consists in thinking the physical motions necessary to produce the tone called for by the note, but not the tone itself, which he only hears as the result of his action. On the other hand, the singer has no definite movement in his throat that he can associate with a given note on the staff. F and F sharp feel the same to him. The singer is obliged to learn his notation not by connecting it with the

actions that produce the tones, but by connecting the notation with the way the tones sound. The first few tones heard tend to establish a key to which all the tones that follow are related, the task of the singer being to associate these tone relationships to the notation that represents them. His mental process, instead of being connected with the physical movement necessary to produce the tone, is a thought process, for he must hear mentally the sound that the note represents before he can produce the tone.

Interpretation. — Learning songs and learning how to sing them expressively in school is largely carried on through imitation, the pupil being required to match or imitate the model tones given as well as the style or way in which the songs are sung. Supporting this work, the thought of the text and the character of the melody are brought home to the student's mind, so that his feeling for the thought and the character of the song aids in getting the quality and rendering desired. Besides this work, vocal habits are developed in the pupil, based on the distinction between the chest and head tones. The former is what the child or youth largely employs in his play, and there is a natural tendency to do the same in music; but when sustained pitch is attempted with this register above B in the middle of the treble staff, the tone becomes hard, and the vocal mechanism strained. The head tone that the child naturally uses when singing above D of the fourth line of the treble staff is clear and sweet. Vocal method in school music is largely concerned in strengthening this upper head tone and developing it downwards. For this reason most teachers agree that scale practice and technical work should commence with the upper part of the voice, with the head tone, bringing this quality down as far as possible and that the lower tone should be sung softly, developing by constant practice an automatic control of the voice. Thus, the first method in school music deals largely with musical interpretation, and consists in: (1) Imitation of a good example. (2) Attention to the thought of the composition, both text and style. (3) Development of clear head tones.

Structure. — Turning now to the second element in learning to read music, the starting point here also lies in imitation. Tone progressions, such as scales or simple songs, are first learned by imitation. These are then sung in connection with their notation, until an association is formed between what is sung and what is seen. Such association is not as simple as it seems, for the notation of music presents three different kinds of tonal relationships: pitch, duration, and metrical grouping. It is through the combination of these three kinds of relationships that the pupil is able to form a concept of the musical movement of his tune. The problem here is essentially the same as that of reading language. From what

the notes indicate, the pupil's mind must be capable of forming concepts of the musical movement sufficiently far ahead of what the voice is producing not to interfere with the even flow of the music. Unlike language, the signs and notes that represent these relationships are not grouped into musical units as letters are combined into words standing for the same idea in whatever combination the words may appear; but every musical unit has its own peculiar combination. The music reader must think these musical units by combining the separate relationships that go to make them up. The most complex part of the training, and the one that requires the closest attention in the methods employed, is concerned with the problem of rapid conception of the tune from its notation. A musical child will often make its associations between the appearance of the notes upon the staff and the movement of the music, so that he is able to read music fairly well, without being able to tell definitely the separate intervals of duration and pitch, representing the musical thought.
